A series of freezing tests on Kanto loam were conducted under various overburden pressures to find the steady growth condition of a segregated ice layer. The steady growth condition was found to be determined by the absolute value of the temperature gradient of the unfrozen part of the soil a sub u near the 0 C isotherm and that of the frozen part of the soil alpha sub f near the warmest end of an ice layer under given hydraulic conditions and applied effective pressure sigma. This is the first of a two-part presentation on the subject; the analytical aspects of the study are presented in a second report.

ESTIMATION OF GEOMAGNETIC CONJUGATE POINTS BY USING Pc5 PULSATIONS [PC5 MYAKUDO O MOCHIITA CHIJIKI KYOEKITEN NO SUITEI]
Ken-Ichi Kato, Yutaka Tonegawa, and Natsuo Sato *In* National Inst. of Polar Research, Antarctic Record, Volume 36, No. 1 30 Mar. 1992 p 1-14 In JAPANESE (For primary document see N94-29078 08-46)
Avail: CASI HC A03/MF A02

In this report, an attempt was made to estimate the geomagnetic conjugate points by using the Pc5 geomagnetic pulsation data obtained simultaneously at three stations in Iceland and at three stations in Antarctica (including Showa Station) during the period of Mar. and May in 1988. It is assumed in the estimation that Pc5 pulsations are odd mode standing oscillations of the field line and have linear phase variations among the stations in the horizontal plane. The result shows that conjugate points of Showa Station estimated from Pc5 events are concentrated around the point calculated from the magnetic field model, within the range of +/- 3 deg in the longitude, i.e., less than 1/5 wave length, and +/-0.5 deg in the latitude.

The western Soer-Rondane Mountains were once covered by the ice sheet. The mountains are in some places covered with tills weathered in various degrees. Heavily weathered ground including Pliocene till is found on flat-topped surfaces of the mountains and glacial benches about 100 m higher than the present ice surface. Heavily weathered ground is found also in ice-free valley, bottom of which is lower than surrounding ice surface. Tills of the early to middle Pleistocene are small in quantity and form only small lateral moraines on the mountain flanks about 100 m higher than the present ice surface. The Pliocene temperate ice sheet produced, transported, and deposited a large quantity of tills and eroded the valley systems. The ice sheet shrank and the most part of the mountains emerged from ice by the latest Pliocene. The lowest level of the ice sheet during this deglaciation was probably lower than that of the present day. The temperate ice sheet changed into cold one in early Pliocene and re-advanced up to about 100 m higher than the present ice surface. Subsequently, the ice sheet retreated again to about 10 m higher than the present level by tens of thousands of years ago. Then, notable fluctuation of the ice level has not occurred. A warmer environment is suggested by large crystals of gypsum grown in lakes during the last deglaciation period.

ESTIMATION OF THE NET PRODUCTION OF MOSS COMMUNITY AT LANGHOVDE, EAST ANTARCTICA [HIGASHI NANKYOKU RANGUHOBUDE NI OKERU SENRUI NO JUN SEISANRYO NO SUITEI] **c51**

Yoshio Ino *In* National Inst. of Polar Research, Antarctic Record, Volume 36, No. 1 30 Mar. 1992 p 49-59 Sponsored by National Inst. of Polar Research (For primary document see N94-29078 08-46)
Avail: CASI HC A03/MF A02

Field measurements of net photosynthesis and dark respiration (CO2 exchange) of moss colonies were carried out at Langhovde, East Antarctica, 17 Jan. 1988. Each colony growing at the Yukidori Valley, Langhovde was composed of Grimmia lawiana, Bryum pseudotriquetrum or the mixture of Ceratodon purpureus and B. pseudotriquetrum. Microclimatic data (photo-synthetic photon flux density and moss temperature) in the assimilation chamber were recorded at the same time. A simple model to estimate the net photosynthetic rate and dark respiration rate on the basis of the microclimatic data was developed on Kappen's model. Net primary production of these moss colonies was calculated with the microclimatic data recorded separately at the Yukidori Valley Jan. 1988 - Jan. 1989. The estimated net production rates of moss colonies growing in the upper reaches of the Yukidori Valley ranged from 8.8 to 11.3 mol CO2 m(exp -2)y(exp -1), or from 230 to 296 gdw m(exp -2)y(exp -1). Zooplankton samplings were conducted at six stations along 33.5 deg E in the Indian sector of the Antarctic Ocean 25 Feb. - 2 Mar. 1976 by the 17th Japanese Antarctic Research Expedition. Vertical hauls from a depth of 200 m to the surface with a Norpac net (45 cm in diameter, 0.33 mm mesh openings) were performed. Copepoda occupied more than 85 percent of the total individual numbers of zooplankton at all stations. The species composition and abundance of copepods were investigated. A total of 18 species except for Oncaeidae were identified. Calanus propinquus, Calanoides acutus, Rhincalanus gigas, Ctenocalanus vanus, Scolecithricella glacialis, and Oithona similis were found commonly at almost all stations. Miclocalanus pygmaeus, Lucicutia sp., Haloptilus ocellatus, Haloptilus oxycephalus and Metridia gerlachei occurred south of 60 deg S and Calanus simillimus, Clausocalanus laticeps, Metridia lucens and Oithona frigida occurred north of 60 deg S. Euchaeta antarctica, Racovitzanus antarcticus and Heterorhabdus austrinus occurred sporadically and/or in small number. Author (NASDA)

JARE (Japanese Antarctic Research Expedition) dispatched two wintering parties to Showa and Asuka Stations in Antarctica. The report describes the activities of the JARE-31 wintering party at Showa Station. A total of 30 members, including 15 scientists and 15 logistics, had stayed at the station 1 Feb. 1990 - 31 Jan. 1991. The major tasks assigned to the wintering party by the JARE headquarters were to conduct more than 60 items of the observation including launching of the ozone sonde and total ozone observation as a routine meteorological observation, STS (Space Transportation System) earthquake observation, and field experiments of ACR (Active Cavity Radiometer) program with major focus on the interaction between sea ice and atmosphere. EXOS-D (Exospheric Satellite-D) and MOS-1 (Marine Observation Satellite-1) observation and the experiments on penguin foraging ecology were also important programs. All these scientific experiments were performed successfully. The particular success of the field experiments of ACR was partly due to the better sea ice condition that guaranteed safe activities on sea ice throughout the year. Regarding the maintenance of the station, a new program on the waste disposal has started in relation to the conservation of the Antarctic environment. A large amount of the disposed waste was brought back to the country. Author (NASDA)

The wintering party at Asuka Station (71 deg 31 min 34 sec S, 24 deg 8 min 17 sec E, 30 m a.s.l.) by the 31st Japanese Antarctic Research Expedition-31 (JARE-31), consisting of eight personnel, maintained Asuka Station continuously 25 Dec. 1989 - 26 Dec. 1990. The main scientific programs of the party were the meteorological observation and studies of upper atmosphere physics. Other programs comprised geological investigation and search for meteorites in the Soer Rondane Mountains, and medical-biological studies, glaciological studies and logistic survey of the housing at Asuka Station and its vicinity. During the 1989/1990 summer season, Asuka Station was used as the base camp for the helicopter operation in the Soer Rondane Mountains. All programs were carried out successfully during the wintering and the Station was succeeded by JARE-32. Author (NASDA)

The collaboration between Japanese and Chinese biologists started in the 1988/1989 season with a three-year program at Great Wall Station, King George Island. For the third year of the program (1990/1991), two Japanese botanists carried out the field survey on freshwater algae and bryophytes in the 7th Chinese National Antarctic Expedition (CHINARE-7). Taxonomic study of freshwater algae was carried out at the Fildes Peninsula. About 110 taxa were recognized in the samples collected from a variety of freshwater habitats. Distribution of snow algae was studied with reference to micro-habitat and snow properties as a cooperative study with a Chinese scientist. The microclimate and photosynthetic activities of moss colonies around Great Wall Station were studied. Vertical cross-sections of moss colonies were examined to study the structure and dynamics of moss colonies. Author (NASDA)

According to the Recommendation 15-1 adopted at the 15th Antarctic Treaty Consultative Meeting in October 1989, the elaboration of the Comprehensive Measures for the Protection of the Antarctic Environment and Dependent and Associated Ecosystems was undertaken by the ATCP (Antarctic Treaty Consultative Parties) at Vina del Mar in Chile in Nov.

1990. The five meetings, one at Vina del Mar and four at Madrid, were held as the 11th Antarctic Treaty Special Consultative Meeting. The meetings were attended also by non-Consultative Antarctic Treaty Parties and intergovernmental and non-governmental organizations such as CCAMLR (Convention on the Conservation of Antarctic Marine Living Resources), IOC (Intergovernmental Oeanographic Commission), SCAR (Scientific Committee on Antarctic Research), IUCN (International Union for the Conservation of Nature and Natural Resources), ASOC (Antarctica and Southern Ocean Coalition), etc., as observers. The Protocol on Environmental Protection to the Antarctic Treaty and its four annexes were adopted by the ATCP on 4 Oct. 1991. Part of the process of negotiations and the background of the adopted instruments are reported. The authentic texts of Protocol and its Annexes in English and their provisional Japanese translation are appended. Author (NASDA)

This report describes a new 4-class neural network for automated identification of initial wave type (Teleseism, Regional P, Regional S, or Noise) for data recorded by 3-component stations or arrays. This is an extension of the 2-class (P or S) neural network that we developed for 3-component stations. The input data are dominant period, polarization attributes, contextual information (e.g., measurements related to a group of arrivals), a spectral representation of the horizontal-to-vertical power ratio, and the slowness determined by f-k analysis for array stations. We used a three-staged approach, and each stage consists of a 2-class neural network. The first stage separates signal from noise. The signals are passed to the second stage which separates regional S phases from regional P phases and teleseisms. The regional P phases and teleseisms are passed to the final stage which separates them into two distinct classes. A three-layer backpropagation neural network is used at each stage. Neural networks were trained for six 3-component IRIS/IDA stations in the CIS, and a 4-element micro-array in Kislovodsk. The identification accuracy of the neural networks is greater than 90% for most of the stations that we tested. The neural network module was integrated into the Intelligent Monitoring System (IMS), and it was applied to the 3-component IRIS/IDA data under simulated operational conditions. The result was a reduction in the number of false-alarms produced by the automated processing and interpretation system by about 60%. DTIC

OBSERVATIONS OF THE GEOMAGNETIC FIELD BY POLAR PATROL BALLOON (PPB) EXPERIMENT IN ANTARCTICA
Fumio Toyama, Ryoichi Fujii, Masaki Ejiri, and Nobuyuki Yajima *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 15-24 (For primary document see N94-29233 08-46)
Avail: CASI HC A02/MF A02

Two scientific balloon experiments of the Polar Patrol Balloon (PPB) project were performed by the 32nd Japanese Antarctic Research Expedition in December 1990 to January 1991. Proton precession magnetometers were used to measure the total intensity of the geomagnetic field for studying the underground magnetic structure by detecting magnetic anomalies and geomagnetic variations like pulsations. The first balloon (PPB-1) showed a trajectory through the center of the Magnetic South Pole with a circumpolar trajectory. The total intensity of the geomagnetic field as obtained by the ARGOS data transmission system every 30 s with an accuracy of 1 nT during the flight of 22 days. A new proton precession magnetometer system that had a wide dynamical measurement range for the PPB observation was developed. This paper reports magnetometry, data processing system, and some preliminary results. Author (NASDA)

LONG TERM VARIATIONS OF RADIO AURORAL ACTIVITY
Kazuhiro Otaka and Takashi Tanaka *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 36-41 (For primary document see N94-29233 08-46)
Avail: CASI HC A02/MF A02

Long term variations of radio auroral activity are investigated from auroral radar data obtained at Showa Station during 1978-1990. The diurnal variation of radio auroral activity shows a maximum in the post-midnight period with a small peak in the evening. Similar to the case of magnetic activity, the occurrence rate of radio aurora shows semi-annual variations with summer (December) and winter (June) time minimums. For post-midnight radio aurora, summer minimums are more pronounced than winter minimums. The magnetic activity controls the occurrence of evening time radio aurora

more notably than post-midnight radio aurora. For the solar cycle variation, a double-peaked modulation is seen during an 11-year sunspot cycle, with a major peak in the declining phase of the sunspot cycle and a secondary peak in the increasing phase. Author (NASDA)

NEW-TYPE ECHOES OBSERVED WITH THE 50 MHz AURORAL DOPPLER RADAR AT SHOWA STATION Abstract Only

Manabu Kunitake, Takashi Tanaka, Kiyoshi Igarashi, Shinichi Yamamoto, Hideo Maeno, and Tadahiko Ogawa *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 42-46 (For primary document see N94-29233 08-46)
Avail: CASI HC A01/MF A02

VHF Doppler radars have been used for the study of auroral E-region irregularities. The Doppler spectra of radar echoes, which give important information for investigating the plasma instabilities responsible for irregularities, are categorized into type 1 - 4. This report presents a new type of aurora echoes detected by the 50 MHz auroral Doppler radar at Showa Station. Preliminary statistical analyses indicate that these echoes (almost appearing at nearest radar ranges) have narrow spectral peaks located at the frequencies less than the range between plus and minus 20 MHz, and occur in the morning with the durations of a few tens of seconds to a few tens of minutes. The diurnal occurrence rate is very different from that of usual radar echoes. The new-type echoes do not seem to belong to any of echo types (type 1 - 4). At this stage, the mechanisms causing these new echoes are supposed to be some electrostatic waves existing between 0 and 110 km altitudes, or specular back-scatter reflection. More analytical and theoretical work is required to understand the new-type echoes. Author (NASDA)

INITIAL OBSERVATION RESULTS WITH IMAGING RIOMETER AT NY-ALESUND (L IS EQUAL TO 16)

Masanori Nishino, Yoshihito Tanaka, Takasi Oguti, Hisao Yamagishi, and Jan A. Holtet *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 47-61 Original contains color illustrations (For primary document see N94-29233 08-46)
Avail: CASI HC A03/MF A02

An imaging riometer was installed at Ny-Alesund (invariant latitude, 75.6 deg) for observations of spatial structure and motion of auroral absorption regions. The antenna consists of a two-dimensional dipole array with 64 elements, and a phasing matrix that produces 64 pencil beams viewing an ionospheric area of about 200 km square at 0 km altitude. The instrument provides with a two-dimensional image of enhanced absorption at 30 MHz with spatial resolution of 20 km and time resolution of 1 s by using an eight-channel radio receiver. With the aid of a personal computer, the absorption images are able to be monitored in real time by using a quiet day curve produced from daily variations of cosmic radio noise intensity during initial 10 days. Three examples of the absorption images are presented for events that occurred in daytime, evening, and night time.

A THEORY OF CURRENT GENERATOR IN THE MAGNETOSPHERE-IONOSPHERE COUPLING

Takashi Yamamoto and Masao Ozaki *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 62-69 (For primary document see N94-29233 08-46)
Avail: CASI HC A02/MF A02

A theoretical model for generation of a pair of region 1 and region 2 Field-Aligned Currents (FAC's) is presented. From the observed pattern of auroras, the existence of a Hot Plasma Torus (HPT) in the magnetosphere can be assumed. An HPT is defined as a hot plasma contained in the magnetic shell which is connected to two ovals of diffuse auroras on the northern and southern polar ionospheres. It is proposed that region 1/region 2 FAC's can be generated as a result of natural distortion of the HPT under the influence of the solar wind convection. Author (NASDA)

COMPUTER SIMULATIONS ON DEVELOPMENT OF THE FAST RECONNECTION MECHANISM Abstract Only

Masayuki Ugai *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 70-75 (For primary document see N94-29233 08-46)
Avail: CASI HC A02/MF A02

In space plasma, large dissipative events, such as solar flares and geomagnetic substorms, occur by drastic release of critically stored magnetic energy in a current sheet system resulting from electrical resistivity or switch-off shocks. The fast reconnection mechanism is a process in which magnetic reconnection rapidly proceeds in the local-diffusing region to retain the switch-off shocks in the system. This study examined why the fast reconnection mechanism occurs and is maintained in actual system, using two-dimensional Magnetohydrodynamic (MHD) simulations by a computer. Spontaneous growth of magnetic reconnection in a large-scale current sheet system was simulated, varying resistivity without special boundary conditions. As a result, it is demonstrated that the reconnection process is strongly controlled by the resistivity models. For a suitable anomalous resistivity model, the quasi-steady fast reconnection mechanism, involving standing switch-off shocks, can be spontaneously established from the current sheet, and the boundaries enclosing the quasi-steady region are not physical boundaries, but must be determined only by the self-consistent development of the fast reconnection process. COUPLED MAGNETOHYDRODYNAMIC OSCILLATIONS IN THE MAGNETOSPHERE-IONOSPHERE SYSTEM: HALL CURRENT EFFECT

Shigeru Fujita *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 76-89 (For primary document see N94-29233 08-46)
Avail: CASI HC A03/MF A02

As the first step to a quantitative study of the magnetohydrodynamic coupled oscillations for the magnetosphere-ionosphere system, the basic equations are revised into a suitable form for computer calculations by means of the finite element method. Numerical analysis is performed by using a simple box model, taking account of the anisotropically conducting ionosphere and the insulating atmosphere. Owing to limited capacity of a computer, the effect of the ionospheric Hall current is discussed. The following results were obtained: (1) the mode conversion effect due to the Hall current gives rise to resonant coupling when the azimuthal wave number is zero (the azimuthal direction is referred to the direction perpendicular to the plane of the box model); and (2) the Alfven mode perturbation is enhanced along the resonant field line but in the case of the fast magnetosonic mode the enhancement does not occur.

SCALE-LENGTH DEPENDENCE OF THE RATIO BETWEEN THE MAGNETIC AND ELECTRIC FIELD PERTURBATIONS IN THE IONOSPHERIC FIELD-ALIGNED CURRENT REGION

Mamoru Ishii, Masahisa Sugiura, Toshihiko Iemori, and James A. Slavin *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 90-102 Sponsored by Ministry of Education, Science and Culture (For primary document see N94-29233 08-46)
Avail: CASI HC A03/MF A02

There is generally high correlation between the orthogonal magnetic and electric field perturbations on the ionospheric field-aligned current region based on observations by polar orbiting satellites. The ratio between the magnetic and electric field perturbations, delta B(sub z)/mu(sub 0)E(sub x), has a scale-length dependence: the ratio delta B(sub z)/mu(sub 0)E(sub x) decreases with decreasing scale length. B. Forget et al. explained this scale-length dependence using a static model. In this report, the ratio delta B(sub z)/mu(sub 0)E(sub x) observed by the DE-2 (Dynamics Explorer-2) satellite for various spatial scales was compared with the effective Pedersen conductivity Sigma(sub P, eff) calculated by the method of Forget et al. The results show that in many cases this model can adequately explain the observed scale-length dependence. However, cases exist in

which the difference, delta B(sub z)/mu(sub 0)E(sub x)-Sigma(sub P, eff), decreases at about 0.25 - 1.0 s in temporal scales (2 - 8 km in spatial scales). This behavior is explained as being due to Alfven waves.

ULF WAVES AND MAGNETIC FIELD CHARACTERISTICS IN THE POLAR CUSP OBSERVED AT GODHAVN
Toru Sakurai, Yutaka Tonegawa, Kenichi Kato, Kazuo Makita, Masaki Ejiri, Hisao Yamagishi, and Natsuo Sato *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 103-116 (For primary document see N94-29233 08-46)
Avail: CASI HC A03/MF A02

For the intrusion of the solar energy into the magnetosphere the polar cusp has been believed to be the most important region in the magnetosphere. By using magnetometer data obtained in November 1989 at Godhavn in Greenland located in the polar cusp, the dayside enhancement of Ultra Low Frequency (ULF) wave activity is studied in relation to both variations of the ground magnetic field and the interplanetary magnetic field. Godhavn is found to be one of the appropriate stations for studying magnetic field variations and ULF waves in the polar cusp, i.e., the normal-run magnetograms show negative H component excursion during the day time, sometimes sporadically and in the other time gradually. The ULF waves enhance their activity closely associated with these negative field variations. These field variations might be considered to occur when the station passes under the westward current flowing in the cusp ionosphere. By comparing the ground magnetic activities with the interplanetary magnetic field, the ground magnetic activities occur in association with high frequency fluctuations of the Interplanetary Magnetic Field (IMF). A comparison of spectral power of the ULF wave at Godhavn (cusp latitude) with those at Showa (auroral latitude) showed more enhanced magnetic power and more resonance-like oscillation of ULF waves at the auroral latitude.

STUDY OF GENERATION MECHANISMS OF MAGNETOSPHERIC VLF/ELF EMISSIONS BASED ON THE DIRECTION FINDINGS
Masashi Hayakawa *In* National Inst. of Polar Research, Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No. 6 Feb. 1993 p 117-133 (For primary document see N94-29233 08-46)
Avail: CASI HC A03/MF A02

The purpose of this report is to review the studies on the generation and propagation mechanisms of magnetospheric VLF (Very Low Frequency)/ELF (Extremely Low Frequency) emissions based on the direction finding measurements on board spacecrafts in order to demonstrate the potential use of the direction finding measurements in plasma wave studies. The plasma waves treated in this report are: (1) half-gyrofrequency VLF emissions; (2) ELF hiss in detached plasma regions of the magnetosphere; (3) plasmaspheric ELF hiss; (4) VLF/ELF chorus; and (5) hiss-triggered chorus.

GLACIOHYDROLOGIC AND GLACIOHYDRAULIC EFFECTS ON RUNOFF AND SEDIMENT YIELD IN GLACIERIZED BASINS
Daniel E. Lawson Nov. 1993 121 p
(AD-A275134; CRREL-MONO93-2) Avail: CASI HC A06/MF A02

Glaciers exert significant control on runoff and sediment yield of partly glacierized basins, such basins being inherently more complex than non-glacierized basins. Glaciohydraulic and glaciohydrologic processes and factors determine the characteristics of runoff and of sediment discharge of rivers draining glacierized catchments. Significant problems develop in predicting both short- and long-term variations in water and sediment discharge because of the complicating effects of these processes and factors. Predictions are necessary for effective management of a basin or watershed's water resources. These processes and factors must therefore be incorporated to improve predictive models of runoff and develop models for sediment yield. In this monograph, the current state of knowledge on the nature of runoff and sediment yield in rivers originating in partly glacierized basins is reviewed and integrated into analyzing the glaciohydrologic and glaciohydraulic processes and factors determining basin characteristics. Current statistical and physical models for predicting runoff and sediment yield in glacierized basins are reviewed and, based upon an assessment of both the state of knowledge and modeling techniques, future research or application of existing knowledge to improve predictions are recommended.

STATISTICAL CHARACTERIZATION OF RUGGED PROPAGATION PATHS WITH APPLICATION TO Rg SCATTERING STUDY Semiannual Report
Rong-Song Jih 5 Nov. 1993 186 p
(Contract F29601-91-C-DB23)
(AD-A275237; TGAL-93-07) Avail: CASI HC A09/MF A02

Motivated by many observations of correlation between the free-surface topography and the coda generation at teleseismic and regional distances, seven simple statistics have been tested whether they can fully characterize the roughness of an arbitrary rugged free-surface topography. Based on 2-dimensional finite-difference simulations, the normalized arc length and Durbin-Watson number are identified as the best and the poorest, respectively, roughness measures, in terms of correlating with the propagation behavior of Rg. The numerical experiments show that rougher topography causes stronger attenuation (as expected), that reflection is an efficient process, and that the bulk of the energy which is not transmitted across the topography is either converted to body waves or reflected back. The scattered P and S waves are radiated as coda to teleseismic distances and some P-SV energy could be trapped in the crustal waveguide. The scattered body waves appear to radiate from the changes in slope and to first order can be visualized as from point diffractors along the rugged free-surface. Rg-to-S conversion is more efficient than that of Rg-to-P. The spatial Q values associated with rough topographic profiles range from 15 to 80, which are in excellent agreement with Q(Beta) of the uppermost crust in many places of the world. The attenuation coefficient, gamma, and the scattering loss can be asymptotically represented as linear functions of the roughness parameters. This work offers a promising approach to quantify effects of scattering by topography and heterogeneity upon other regional phases.

MESOPAUSE WINDS AND OH INTENSITIES AT MID-LATITUDES-FABRY-PEROT INTERFEROMETER OBSERVATIONS OF THE OH EMISSION AT 8430 A FROM BEAR LAKE OBSERVATORY M.S. Thesis
Carolyn M. Vadnais 1993 202 p
(AD-A275246; AFIT/CI/CIA-93-157) Avail: CASI HC A10/MF A03

Observations were made from Bear Lake Observatory using an Imaging-Fabry-Perot Interferometer. Neutral winds were derived from the Doppler shift to the emission line, and relative intensity was also analyzed. Results presented are from the period between December 1991 and March 1992. The 8430 A OH data showed remarkable day-to-day variability in the wind pattern. Diurnal, semidiurnal, and terdiurnal tidal components all appeared at some point during the observing period with no consistent regularity. The OH intensities showed the presence of gravity wave activity with discernible period down to approximately 3 hours. The 6300 A O(1D) wind and intensity observations showed a high degree of magnetic activity which correlated positively with Kp and Ap indices. We noted a definite presence of auroral and SAR-arc activity almost nightly on nights when the 6300 A O(1D) emission was observed.

FAST GRAVITY, GRAVITY PARTIALS, NORMALIZED GRAVITY, GRAVITY GRADIENT TORQUE AND MAGNETIC FIELD: DERIVATION, CODE AND DATA
Robert G. Gottlieb Feb. 1993 64 p
(Contract NAS9-17885)
(NASA-CR-188243; NAS 1.26:188243) Avail: CASI HC A04/MF A01

Derivation of first and second partials of the gravitational potential is given in both normalized and unnormalized form. Two different recursion formulas are considered. Derivation of a general gravity gradient torque algorithm which uses the second partial of the gravitational potential is given. Derivation of the geomagnetic field vector is given in a form that closely mimics the gravitational algorithm. Ada code for all algorithms that precomputes all possible data is given. Test cases comparing the new

algorithms with previous data are given, as well as speed comparisons showing the relative efficiencies of the new algorithms. Author

A STUDY OF THE THERMOSPHERIC DYNAMICS OF THE HIGH-LATITUDE E REGION USING A SPECTRAL THERMOSPHERIC GENERAL CIRCULATION MODEL Ph.D. Thesis
James Phillip Gundlach 1993 151 p
Avail: Univ. Microfilms Order No. DA9323876

The E region of the thermosphere suffers from a paucity of data due to the difficulty of obtaining E region measurements. Theoretical modeling studies of the region are therefore of great importance. This study examines the dynamics of the E region using a three dimensional, time dependent, spectral thermospheric general circulation model (STGCM) developed at the Danish Meteorological Institute. The model is nonlinear and includes specifications for the solar heating, auroral forcing, and upward propagating tides. The method of analysis included an examination of the horizontal and vertical wind fields, the vertical momentum fluxes, and the momentum flux-induced accelerations, all of which were obtained as a function of spatial location and universal time. The results obtained for study were from a simulation of two chemical release experiments done in Alaska in 1978 under disturbed conditions and opposite configuration of the IMF B(sub y) component. The model results are shown to adequately reproduce the salient features of the observed wind profiles. A comparison of a steady-state solution, used as the initial condition for the model runs, demonstrate the superiority of the spectral model over the finite difference models for high-latitude studies. The momentum flux is shown to be controlled by the vertical circulation which, in turn, is shown to be controlled by proximity to the high-latitude double-vortex wind system. Consequently, the largest vertical velocities are seen to occur in regions characterized by magnetospheric forcing; minimal vertical velocities occur both outside and within the center of the neutral wind vortices. Significantly, the vertical velocities generally reverse direction around 140 to 150 km. They also reverse directions from upward in the dayside inflow region to downward in the nightside exit flow region. In the F region, they have the same reversal in direction when going from the dawn side to the dusk side. The convergence of the momentum flux with height is seen to imply accelerations with a vertical variation that indicates strong vertical coupling in the upper E region. Dissert. Abstr.

DEVELOPING A DIODE ARRAY SPECTROMETER FOR TROPOSPHERIC CHEMISTRY STUDIES Ph.D. Thesis
Thomas Robert Lanni 1992 201 p
Avail: Univ. Microfilms Order No. DA9323723

The vital role of experimental probes in expanding the horizons of our knowledge of atmospheric chemistry has long been recognized. Application of the growing constellation of spectroscopic techniques to the study of trace gas photochemistry has constituted a new paradigm and contributed in many ways to our understanding of the troposphere. We present a novel technique, Long-Path Diode Array Differential Optical Absorption Spectroscopy (LPDA DOAS), to monitor trace gases in the troposphere. The technique is based on the multiplex advantage of the diode array and the principle of a 'differential' optical absorption cross-section. It enjoys the distinction of being an ambient measurement and hence avoids the pitfalls arising due to sampling biases and wall effects. The use of a diode array permits the dynamic and simultaneous acquisition of constituent spectra, rapid signal averaging, and enhanced dynamic range and signal-to-noise ratio. We show that the technique is sensitive, rapid, and lends itself to a straightforward analysis of species concentration and related photochemical parameters. Furthermore, the use of long optical paths makes this technique useful in relatively clean environments and allows for intercomparison with computer models of the troposphere. Dissert. Abstr.

A STUDY OF THE CONVERGENCE OF SPHERICAL HARMONIC EXPANSIONS OF GRAVITY USING DISTRIBUTED POINT-MASS EARTH MODELS Ph.D. Thesis
William Danny Braswell 1992 195 p
Avail: Univ. Microfilms Order No. DA9313956

A new Earth model consisting of flattened concentric ellipsoidal layers overlaid by a distribution of point masses is developed and used to study convergence of spherical harmonic expansions of gravity in the vicinity of the smallest sphere bounding all the mass. The ellipsoidal layers are formed by 'flattening' the spherical layers from the Preliminary Reference Earth Model (PREM). Cases are examined in which the point masses are distributed uniformly and randomly, with the majority of the masses placed within 5 km of the surface. The masses of the point sources are determined by a least squares fit of the new model to NASA's experimentally derived GEMT1 gravity model. Closed form expressions for gravity external to the model and for the expansion coefficients are derived allowing convergence analysis to arbitrary accuracy to be performed. Results indicate that while spherical harmonic expansions of gravity do converge exterior to the bounding sphere, as theory indicates, when very close to the bounding sphere they may do so only after an initial period of divergence which can continue for several hundred or more terms and during which significant measurable errors can occur. Dissert. Abstr.

MOTION AND DEVELOPMENT OF THE PACIFIC PLATE FROM THE MIDDLE JURASSIC TO THE LATE CRETACEOUS Ph.D. Thesis
Brian Paul Wallick 1992 250 p
Avail: Univ. Microfilms Order No. DA9314094

Aspects of the early history of the Pacific plate were studied using the techniques of rock magnetism and paleomagnetism on samples retrieved from the presumed oldest portion of the Pacific plate. The magnetic properties of 51 basalt samples from Hole 801C were analyzed to study the reason for the magnetic quiescence in the presumed oldest portion of the Pacific plate. The results indicate magnetizations which are not atypical of other younger sites and which are very similar in several respects to Jurassic basalts from the Atlantic. The identification of five inclination zones within the basalt pile are interpreted to be the result of rapid change in polarity of the Earth's magnetic field and suggest a possible reason for the apparent magnetic quiescence. Paleomagnetic analysis of 25 Cretaceous basalts recovered from the Jurassic Quiet Zone region (ODP Site 802) yielded a useful paleolatitude approximation of approximately 19 deg S. Similarities between this estimate and that calculated for the basalts of Site 462, in addition to age similarities and geochemical data, suggest that these may be related as part of an episode of mid-Cretaceous spreading. Finally, the paleomagnetic analysis of sediments from five sites produced reliable paleolatitude estimates from the Bathonian-Callovian to the Campanian-Maestrichtian. The principal results from these paleolatitude estimates outline a general northward migration of the plate for much of its history; however, a period of anomalous south motion was observed for the period of time from approximately 150 to 125 Ma. A period of counter-clockwise rotation of 41 deg calculated from a combination of sediment structural data and FMS images is thought to be responsible for the apparent south motion. Dissert. Abstr.

STUDIES IN JURASSIC AND CRETACEOUS NORTH AMERICAN APPARENT POLAR WANDER Ph.D. Thesis
Mickey Charles VanFossen 1992 220 p
Avail: Univ. Microfilms Order No. DA9313701

An alternative middle Jurassic through mid-Cretaceous North American apparent polar wander path is presented based on pole position studies of middle Jurassic plutons, volcanics and mid-Cretaceous plutons in New England (White Mountains Magma Series), the late Jurassic Morrison Formation in central Colorado, and the latest Jurassic-early Cretaceous

kimberlite dikes in New York State. Isolation of magnetizations on which the pole position data are based is achieved through laboratory decomposition of natural remanent magnetization (NRM) via detailed thermal and alternating field demagnetization experiments. Magnetization stability is evaluated through the application of field tests (e.g., bedding-tilt, reversal, baked contact, and glacial boulder tests). The results suggest an interval of middle Jurassic (approximately 166 Ma) apparent polar wander at 82 deg N, 090 deg E which differs greatly from previous interpretations. Together the new poles break up the latter half of the Mesozoic North American apparent polar wander path into two segments, each about 20 million years long (166 to 143 Ma, and 143 to 124 Ma). The path runs a general easterly course from 82 deg N, 090 deg E to about 58 deg N, 203 deg E during the late Jurassic and early Cretaceous, followed by an abrupt turn north to the mid-Cretaceous pole at 71 deg N, 194 deg E. The implications of this alternative North American apparent polar wander path to plate tectonic studies and to previous analyses of apparent polar wander are discussed. Dissert. Abstr.

N94-29941 Connecticut Univ., Storrs.
EFFECTS AND IMPLICATIONS OF FAULT ZONE HETEROGENEITY AND ANISOTROPY ON EARTHQUAKE STRONG GROUND MOTION Ph.D. Thesis
Wei-Jou Su 1992 170 p
Avail: Univ. Microfilms Order No. DA9315399

This thesis consists of two parts. Part one is concerned with the effect of fault zone heterogeneity on the strong ground motion of the Loma Preita earthquake. Part two is concerned with the effect of the effective hexagonal anisotropy of a fault zone on strong ground motion. A superposition of Gaussian beams is used to analyze these problems because it can account for both the rupture history of the fault plane and the fault zone heterogeneity. We also extend this method to investigate the combined effects of the rupture process on a fault plane and medium anisotropy on the synthetic seismograms. The strong ground motion of the Loma Prieta Earthquake is synthesized using a known three-dimensional crustal model of the region, a rupture model determined under the assumption of laterally homogeneous structure, and Green's functions computed by superposition of Gaussian beams. Compared to results obtained assuming a laterally homogeneous crust, stations lying to the northeast of the rupture zone are predicted to be defocused, while stations lying to the west of the fault trace are predicted to be focused. The defocusing is caused by a zone of high velocity material between the San Andreas and Sargent faults, and the focusing is caused by a region of low velocity lying between the Zayantes and San Andreas faults. If lateral homogeneity is assumed, the net effect of the predicted focusing and defocusing is to bias estimates of the relative slip of two high slip regions found in inversions of local and teleseismic body waves. These biases are similar in magnitude to those estimated for waveform inversions from the effects of using different subsets of data and/or different misfit functions and are similar in magnitude to the effects predicted for non-linear site responses. Dissert. Abstr.

N94-29969 Columbia Univ., New York, NY.
THE RUPTURE PROCESS OF LARGE EARTHQUAKES ALONG CONVERGENT MARGINS: CAST STUDIES FROM ALASKA AND ARMENIA Ph.D. Thesis
Charles Hershey Estabrook 1992 271 p
Avail: Univ. Microfilms Order No. DA9313589

This thesis focuses on the varied nature of earthquake ruptures in regions of convergent tectonics. Several modern and historical earthquakes along the Alaska-Aleutian arc and in Armenia are investigated using body and surface waves. The 1979 St. Elias, Alaska earthquake is analyzed because of unresolved questions about its depth, focal mechanism, seismic moment, and location in a seismic gap. Source mechanisms and locations of the two distinct mainshock subevents and aftershock locations define a shallow dipping surface at the eastern edge of the Pacific plate. The amount of strike-slip motion increases with time in the mainshock implying that a change from thrusting to strike-slip faulting occurs along the plate interface. Aftershock relocation suggests that the main plate boundary may be offset as a result of collision and subduction of the Yakutat terrane. Seismic waves from the 1988 Armenia earthquake are best fit with a source model that includes three subevents. Rupture apparently initiated as a shallow reverse fault at a point of maximum bending on a right-lateral strike-slip fault and then extended bilaterally towards the southeast and west. The largest events along the Alaska Peninsula and Shumagin Islands segments of the Aleutian arc since 1917 are studied to understand the likely modes of rupture in the next sequence of large and great events and to delineate the plate interface geometry. Results from body and surface wave modeling suggest that the 1917 earthquake was smaller than previously thought and was restricted to the eastern-most portion of the gap. Seismic moment and gross rupture characteristics of the great 1938 earthquake along the Alaska Peninsula are estimated using teleseismic body and surface waves. Dissert. Abstr.

A STUDY OF PRECIPITATION IN THE COASTAL AREA OF ANTARCTICA AS OBSERVED AT SYOWA STATION USING A VERTICAL POINTING RADAR [NANKYOKU ENGANIKI SHOWA KICHI DE NO SUICHOKU REDA O MOCHIITA KOSUIRYO NO KENKYU] **c47**
Makoto Wada and Hiroyuki Konishi *In its* Antarctic Record, Vol. 36, No. 3 30 Nov. 1992 p 341-349 (For primary document see N94-29978 08-46)
Avail: CASI HC A02/MF A02

A new vertical pointing radar was installed at Showa Station in 1988 for observing precipitation and clouds in Antarctic Climate Research project started in 1987. The precipitation of 1988 was approximately half of that of 1989. The total precipitation was estimated at about 200 mm from February 23, 1988 to February 22, 1989 and about 390 mm form February 1 to November 30, 1989. The tendency of little snow accumulation in 1988 can be seen in the year-to-year data of the maximum snow depth measured on the sea ice near Showa Station and in the annual data of snow accumulation around the coastal area of the continent near Showa Station. The small precipitation of 1988 at Showa Station seems to be mainly due to small precipitation in winter and spring of 1988, compared with that of 1989. Author (NASDA)

Avail: CASI HC A03/MF A02

Four types of snow vehicles have so far been employed in the Japanese Antarctic Research Expedition. These snow vehicles are mainly used on the inland ice sheet and on the sea ice. As for the inland traverses, the SM50S-type snow vehicle has been used, but the research area is now expanding to the much colder area, and the deep ice coring project at Dome Fuji, East Antarctica, has recently been proposed. Therefore, a committee for the design of a new snow vehicle was organized in the special committee on logistics of the National Institute of Polar Research. The committee made the design of a new snow vehicle capable of operating under very cold and low pressure conditions. The newly developed snow vehicle was operated on the Antarctic ice sheet in the winter of 1992, and the performance was almost just as expected. Author (NASDA)

Avail: CASI HC A03/MF A02

This report describes the design of the systems of a newly developed snow vehicle, which will be used for the deep ice coring project at Dome Fuji, East Antarctica. This vehicle is a cab-over full-track type, in which the accommodations for two persons are prepared. The vehicle is 11,500 kg in gross weight and traverses at 5 to 8 km/h pulling seven wooden type sledges each of which is 2.6 t in loaded weight. The vehicle operates at low temperature down to -60 C on the Antarctic ice sheet from the plain up to the high plateau of 4,000 m in altitude. In addition, the preservation of the vehicle is possible under the severe environment as cold as -0 C. In the process of the development, the requested performance was analyzed first, and then the structure, configuration, and dimensions of the vehicle were estimated. Problems from other snow vehicles operated before in Antarctica were extracted and then were solved by means of experiments and researches to make use of the results for the design.

Avail: CASI HC A01/MF A02

For the purpose of developing a new snow vehicle (common use at temperature about -50 C) for the deep ice coring project at Dome Fuji, East Antarctica, the low temperature toughness of the welded joints of structural steel was investigated. It is empirically well known that in case of vehicles employed in a cold air temperature of about -50 C, the low temperature brittle fracture of the structural members does not take place, if one uses semi-killed or killed steel, for which 50 percent FATT's (fracture appearance transition temperature) of the Charpy impact test is about -50 C and Charpy impact values at -50 C are 20 to 29 J/sq cm. In the present report, the Charpy impact test has been performed for both single pass SMAW (shield metal arc welding) and CO2 arc welded joints of JIS (Japan Industrial Standards) steels of SS400, SL2N255, STPL380, and STPL450. The test results show that the JIS steels of SL2N255 and STPL450 can be used for the new vehicle, considering their toughness.

In order to discover a high cold-resistance material for use in the crawler belt of snow vehicles, the physical properties at very low temperatures of a recently developed material, isoprene/butadiene (70/30) random copolymer filled with carbon black, was investigated in comparison with a blended rubber NR (Natural Rubber) / BR (Butadiene Rubber) (65/35) as well as a currently used NR. It has been found that this material can keep rubber elasticity even at low temperatures below - 70 C, though it is somewhat inferior to the other two materials as to strengths such as stress-at-break and tear; and hence, it is considered as quite worthy of a practical test for a snow vehicle in the Antarctic area.

A NEWLY DEVELOPED SNOW VEHICLE (SM100S) FOR ANTARCTICA. PART 5: RESULT OF GENERAL PERFORMANCE TESTS [NANKYOKU OGATA SETSUJOSHA (SM100S) NO KAIHATSU. 5: SEINO SHIKEN] **c37**
Mitsuru Saito, Tsuyoshi Seki, and Masayuki Hosoya *In* National Inst. of Polar Research, Antarctic Record, Vol. 36, No. 3 30 Nov. 1992 p 410-440 In JAPANESE (For primary document see N94-29978 08-46)
Avail: CASI HC A03/MF A02

This report describes the results of the fundamental and the general performance tests for a newly developed snow vehicle, which will be used for the deep ice coring project at Dome Fuji, East Antarctica. The result of the tests showed that the vehicle generally satisfied the expected performance and the purpose of the systems design, but was partially unsatisfactory in its structure. The tests were carried out on the concrete pavement where its reproducibility is capable of comparing with the performance of similar vehicles and on the compacted snow surface which has the simulated hardness of the Antarctic snow. ACTIVITIES OF THE WINTERING PARTY AT SYOWA STATION BY THE 32ND JAPANESE ANTARCTIC RESEARCH EXPEDITION IN 1991 [DAI 32 JI NANKYOKU CHIIKI KANSOKUTAI SHOWA KICHIETTO (1991) HOKOKU]
Yoshiyuki Fujii *In its* Antarctic Record, Vol. 36, No. 3 30 Nov. 1992 p 441-472 In JAPANESE (For primary document see N94-29978 08-46)
Avail: CASI HC A03/MF A02

The winter party of the 32nd Japanese Antarctic Research Expedition performed its activities at two wintering sites 1991-1992, consisting of 31 members at Showa Station (69 deg 00 min S, 39 deg 35 min E) and eight members at Asuka Station (71 deg 31.5 min S, 24 deg 8 min E). Wintering activities at Asuka Station will be reported separately. The main scientific research programs at Showa Station were as follows: (1) studies on ocean-atmosphere interaction in the sea ice area part of the Antarctic Climate Research Program (ACR); (2) environmental science studies; (3) polar patrol balloon experiment; and (4) life science studies. Various airborne observations and inland glaciological traverses were carried out.

[ACCURATE MODELING OF F-REGION ELECTRON DENSITIES] Annual Progress Report, 1993-1994
1994 8 p
(Grant NAGw-996)
(NASA-CR-195781; NAS 1.26:195781) Avail: CASI HC A02/MF A01

In the past year, we have made considerable progress in a number of areas including algorithm development, completion of two major case studies, and the development of a new EUV flux model. As a result, there has been a major improvement in our ability to model global emissions in

support of NASA's imaging plans. Activity highlights include the following: developed a new algorithm to allow physical models to reproduce observed NmF2; investigated the relationship between NmF2 and F10.7 at Millstone Hill during 1990; developed a new solar EUV flux model; statistical survey of anomalously high nighttime electron T(sub e) at Millstone Hill; conducted a case study of the March 1990 magnetic storm; and conducted a comparison between theory and data of magnetically quiet behavior of the winter ionosphere at Millstone Hill. EXTENSION OF LOVE WAVE TRANSFORMATION THEORY TO LATERALLY HETEROGENEOUS STRUCTURES
F. Romanelli and G. F. Panza Aug. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608098; IC-93/259) Avail: CASI HC A03 (US Sales Only)

By means of the spherical-to-flat transformations for torsional waves, all the flat-transformed components of motion (two for displacement and five for stress) have been derived. This provides the formal basis necessary to treat the propagation of torsional waves in spherical 3-D structures, by using the existing flat-structure computational techniques. DOE

A review is presented of known empirical models for space-energy distributions of particles (electrons and ions) of hot plasma in the region of a geostationary orbit of a satellite. For magnetically quiet periods are developed practically completed models both for ions, and for electrons. The stationary models have simple analytical expressions. DOE

LARGE EDDY SIMULATION OF THE UPPER ATMOSPHERIC SURFACE LAYER Ph.D. Thesis
Xiaoming Cai Jul. 1993 208 p
(ISBN-0-315-85393-X; CTN-94-61155) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Three dimensional large eddy simulation (LES) is adopted to simulate turbulence in the atmospheric boundary layer (ABL), with a fine resolution in the atmospheric surface layer, so that an a-priori value of the von Karman constant and the Monin Obukhov similarity formulas can be derived from the resolved scale turbulence in the upper surface layer (USL). Smagorinsky's sub-grid scale (SGS) model is adopted. The Smagorinsky model Reynolds number ReS is proposed for a LES adopting the Smagorinsky SGS model. This number is shown to be an independent model parameter which determines the statistics of the resolved scale (RS) turbulence in the USL. If ReS is smaller than a critical value, RS fields are damped out, thereby establishing a criterion for a LES adopting the Smagorinsky SGS model. For a neutral static stability ABL, grid spacings are used which fall within the inertial subrange of the USL turbulence in order to follow the assumption of the Smagorinsky SGS model. The average of the velocity fields yields a logarithmic velocity profile in the USL from which the von Karman constant can be derived. The value of this constant and other quantities in the USL exhibit a strong dependence on ReS. For an unstable ASL, profiles of the mean velocity in the USL yield a Monin Obukhov similarity formula for the dimensionless momentum flux.

VARIATIONS OF ELECTRON FLUXES, LOW-FREQUENCY RADIATIONS AND PLASMA DENSITY DURING THE GEOMAGNETIC STORM ON 9-12 MARCH, 1979 ACCORDING TO DATA OF THE INTERKOSMOS-19 SATELLITES
A. A. Gusev, Yu. V. Mineev, M. G. Nikiforova, G. I. Pugacheva, E. D. Tolstaya, and V. I. Larkina 1992 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-607323; NIIYaF-MGU-92-24-273) Avail: CASI HC A03 (US Sales Only)

During the geomagnetic storm on 9-12 March, 1979 simultaneous data were obtained on the field intensity (electronic and magnetic components) of low-frequency radiations (0,1-20 kHz), energetic electron flux density at E(sub e)=0.04-2.0 MeV and protons at E(sub p)=1-30 MeV and thermal plasma density (10(sup 1) - 2x10(sup 6) cm(sup -3)). Correlation dependences of VLF radiation intensity with the plasma parameters and energetic particle variations are established. DOE

CLOUD AND AEROSOL CHARACTERIZATION FOR THE ARM CENTRAL FACILITY: MULTIPLE REMOTE SENSOR TECHNIQUES DEVELOPMENT
K. Sassen 1 Nov. 1993 13 p
(Contract DE-FG02-90ER-61059)
(DE94-003523; DOE/ER-61059/2) Avail: CASI HC A03/MF A01

In support of the initial phase of the Instrument Development Program (IDP) of the Atmospheric Radiation Measurement (ARM) program, the authors have researched the means by which multiple remote sensing techniques could be best applied to characterizing the cloudy atmosphere. This research has directly supported the short-term goal of aiding in the selection of the most appropriate instrumentation for ARM Clouds and Radiation Testbed (CART) sites, but also has more long-term consequences for the application of remote sensing for measuring cloud properties of crucial concern to general circulation and climate models. To accomplish the goals they have (1) developed a mobile, state-of-the-art, scanning polarization diversity lidar (PDL) to test a variety of techniques for cloud remote sensing, including simultaneous dual-wavelength and dual-polarization, and high-speed variable field-of-view operations; (2) successfully participated in field projects using the PDL along with other remote sensors and instrumented aircraft to obtain detailed datasets for the testing of instrument techniques; and (3) in collaboration with researchers at the NOAA Wave Propagation Laboratory, used numerical cloud modeling and empirical studies to develop and refine remote sensing approaches for cloud property retrieval. GENERATION MECHANISMS OF QUASI-STATIONARY WAVES IN THE SOUTHERN HEMISPHERE Ph.D. Thesis
Ignacio-Arturo Quintanar 1993 162 p
Avail: Univ. Microfilms Order No. DA9317893

The effect of Antarctic elevations, the rest of the world orography and thermal forcing from lower latitudes on the atmospheric circulation of the Southern Hemisphere is investigated by following an approach based on the comparison of simulations using the UCLA General Circulation Model (GCM) with different prescribed surface boundary conditions. With the GCM we have started by performing an extended control simulation and a systematic series of hypothesis-testing simulations in which orographic and surface conditions were artificially modified. In high latitudes, GCM simulations without the Antarctic orography or even with the Antarctic orography rotated 180 deg around the South Pole show a QS-wave 1 with substantial amplitude and approximately the same phase as in the control simulation with full orography. At polar latitudes, on the other hand, the local maximum in QS-wave 1 that is present in the observational data is only obtained in the control simulation, although the experiment where the Antarctic elevations are rotated 180 deg also produces large values. The GCM simulation with all orographic elevations removed shows QS-wave 1 with an amplitude about 40 percent smaller than that found in the control simulation. Thus QS-wave 1 in the Southern Hemisphere is not primarily generated by the Antarctic elevations. Other contributors to the generation of QS-wave 1 are the rest of the world orography, thermal forcing from lower latitudes and forcing by transient eddies. The results also suggest that zonal asymmetries in sea surface temperature (SST) and sea-ice south of 46 deg S are closely linked to the phase of a zonal wavenumber 2 component (QS-wave 2) at upper levels at high and polar latitudes of the Southern Hemisphere. Previous studies with simpler models suggest that the Antarctic orography can generate a stationary wave field at high and middle latitudes that has substantial pattern similarities with the observed. This is verified by using a barotropic model with both idealized and realistic representation of the Antarctic orography forced by relaxation to the October zonal mean climatology. Nevertheless, to obtain a realistic amplitude of the waves with the barotropic model requires a somewhat arbitrary specification of the magnitude of the forcing. The results of the GCM

simulation suggest, however, that realistic forcings would produce amplitudes of the quasi-stationary wave field that are significantly weaker than the observed. Dissert. Abstr.

N94-30802 Illinois Univ., Urbana-Champaign.
THEORY AND OBSERVATIONS OF HORIZONTAL AND VERTICAL STRUCTURE OF GRAVITY WAVE PERTURBATIONS IN THE MIDDLE ATMOSPHERE Ph.D. Thesis
Chris Alan Hostetler 1993 142 p
Avail: Univ. Microfilms Order No. DA9329061

Gravity wave models for the horizontal wave number spectra of atmospheric velocity and density fluctuations are derived by assuming that both saturated and unsaturated waves obey the polarization and dispersion relations and that the joint (m,w) spectrum is separable. The models show that the joint (k,l,m) and (k,l,w) spectra are not separable. The one-dimensional horizontal wave number spectra models are consistent with existing observations of horizontal wave number spectra in the lower stratosphere and upper mesosphere. The gravity wave models are used to analyze the effects of Doppler shifting caused by the mean wind field on the separability of gravity wave spectra. If the intrinsic joint (m,w) spectrum is separable, Doppler effects associated with even small mean winds will destroy separability of the observed joint (m,w(sub o)) spectrum, particularly at high vertical wave numbers. Vertical and horizontal wave number spectra of density perturbations in the upper stratosphere (25-40 km) and the upper mesosphere (approximately 80-105 km) measured during the ALOHA-90 campaign are presented. The spectra were inferred from approximately 45 h of airborne Na/Rayleigh lidar observations in the vicinity of Hawaii. Density variances, vertical shear variances, Richardson's numbers, characteristic vertical and horizontal wave numbers, and power law slopes of the vertical and horizontal wave number spectra are computed and discussed. The observed m-spectra contradict the predictions of the linear instability theory of Dewan and Good, and the scale-dependent diffusive filtering theory of Gardner, and appear to be compatible with the Doppler spreading theory of Hines, the scale-dependent diffusion theory of Weinstock, the scale-independent diffusive filtering theory of Gardner, and the similitude model of Dewan. In the stratosphere, the m-spectra exhibit significant energy at low wave numbers less than the values expected for m(sub *). The source of this energy is believed to be geostrophic adjustment of the jet stream. Dissert. Abstr.

RADIATION TRANSPORT IN CLOUDY AND AEROSOL LOADED ATMOSPHERES Ph.D. Thesis
Arve Kylling 1992 179 p
Avail: Univ. Microfilms Order No. DA9325174

The equation for radiation transport in vertical inhomogeneous absorbing, scattering, and emitting atmospheres is derived from first principles. It is cast in a form amenable to solution, and solved using the discrete ordinate method. Based on the discrete ordinate solution a new computationally efficient and stable two-stream algorithm which accounts for spherical geometry is developed. The absorption and scattering properties of atmospheric molecules and particulate matter is discussed. The absorption cross sections of the principal absorbers in the atmosphere, H2O, CO2 and O3, vary erratically and rapidly with wavelength. To account for this variation, the correlated-k distribution method is employed to simplify the integration over wavelength necessary for calculation of warming/cooling rates. The radiation model, utilizing appropriate absorption and scattering cross sections, is compared with ultraviolet radiation measurements. The comparison suggests that further experiments are required. Ultraviolet (UV) and photosynthetically active radiation (PAR) is computed for high and low latitudes for clear and cloudy skies under different ozone concentrations. An ozone depletion increases UV-B radiation detrimental to life. Water clouds diminish UV-B, UV-A and PAR for low surface albedos and increase them for high albedos. The relative amount of harmful UV-B increases on overcast days. The daily radiation doses exhibit small monthly variations at low latitudes but vary by a factor of 3 at high latitudes. Photodissociation and warming/cooling rates are calculated for clear skies, aerosol loaded atmospheres, and atmospheres with cirrus and water clouds. After major volcanic explosions aerosols change O3 and NO2 photodissociation rates by 20 percent. Both aged aerosols and cirrus clouds have little effect on photodissociation rates. Water clouds increase (approximately 100 percent) photodissociation rates that are sensitive to visible radiation above the cloud. Solar warming rates vary by 50 percent in the stratosphere due to changing surface albedo. Water clouds have a similar effect. The net effect of cirrus clouds is to warm the troposphere and the stratosphere. Only extreme volcanic aerosol loadings affect the terrestrial warming rate, causing warming below the aerosol layer and cooling above it. Aerosols give increased solar warming above the aerosol layer and cooling below. Dissert. Abstr.

ELECTROMAGNETIC CORE-MANTLE COUPLING Ph.D. Thesis
Jeffrey James Love 1993 144 p
Avail: Univ. Microfilms Order No. DA9318678

Due to exchanges of angular momentum between the earth's fluid outer core and the overlying solid mantle, the earth's rotational rate fluctuates on periods of a few years to a few decades. However, the mechanism which allows the exchange of angular momentum is not understood. Here we examine the possibility that core-mantle coupling is predominantly electromagnetic and thus responsible for the decadal length of day variations. The electromagnetic couple may be divided into poloidal, advective, and leakage couples. The poloidal couple results entirely from the interaction of the poloidal field with currents induced by its time variation. The advective couple results from the dragging of poloidal field lines through a conducting mantle. The leakage couple results from the diffusion of toroidal magnetic field from the core's interior into the mantle. The poloidal and advective couples can be calculated by using models of the downward continued poloidal field and models of the core velocity field deduced from the secular variation of the poloidal field. On the other hand, the leakage field requires knowledge of the toroidal field, which cannot be obtained directly from surface observations. By treating the determination of the toroidal field at the core-mantle boundary as an inverse problem, we find that toroidal field models consistent with both advection in the core and the decadal length of day variations have a complex structure and are not simply quadrupolar, as assumed by other investigators. Moreover these toroidal field models are too strong according to dynamo theory, produce electric fields at the earth's surface which are stronger than measured values, and produce ohmic heating which either exceeds or contributes an unacceptably large fraction of the earth's surface heat flow. Therefore, we conclude that core-mantle coupling is not predominantly electromagnetic. We also investigate the effect of lateral variations in mantle conductivity on our interpretation of processes occurring in the core and find that the effect is negligible. Dissert. Abstr.

THE LONG-RANGE TRANSPORT OF AEROSOL PARTICLES OVER THE NORTH ATLANTIC OCEAN Ph.D. Thesis
William Grenville Ellis, Jr. 1992 217 p
Avail: Univ. Microfilms Order No. DA9316591

As part of the Atmosphere/Ocean Chemistry Experiment (AEROCE), daily aerosol samples were collected at Bermuda and Barbados. In addition, gas-phase (222)Rn concentrations were analyzed hourly from July 1991 to June 1992. Isentropic analyses, isentropic trajectories, and non-isentropic trajectories were used to understand the long-range transport of these substances. In particular, the sources of selenium (Se) at Bermuda and Barbados, the transport of aluminum (Al) at Barbados, and the effect of atmospheric stability on radionuclides at Bermuda, were investigated. At Bermuda, approximately 55 percent of the aerosol Se came from anthropogenic sources located in North America, while the remainder appeared to be from a marine biogenic source. At Barbados, 60-80 percent of the Se was attributed to marine biogenic sources. At Barbados, the transport of Al from northern Africa to Barbados was modelled using a vertical interpolation of wind fields. Stokes's law of gravitational settling was used to parameterize the vertical motion. The trajectories using Stokes's law more accurately predicted the source region of the Al compared to low-level isentropic trajectories. The affect of tropospheric stability on the concentrations of (222)Rn, (210)Pb and (7)Be sampled at Bermuda was investigated. (7)Be has an upper tropospheric source, while (222)Rn and (210)Pb both have a continental source. The stability of the lower troposphere was calculated based on the relative separation of isentropic surfaces over North America. The results showed that this measure of stability was able to resolve the seasonal effect of stability on these radionuclides, but was not a quantitative predictor. Dissert. Abstr.

N94-30869 Colorado Univ., Boulder.
THEORY AND APPLICATION OF A RADIO-ACOUSTIC SOUNDING SYSTEM (RASS) Ph.D. Thesis
Richard Joseph Lataitis 1992 222 p
Avail: Univ. Microfilms Order No. DA9318108

The speed of sound in air is proportional to the square root of the virtual temperature. A conventional Doppler wind-profiler radar can measure the speed of a sound wave, emitted from a nearby acoustic source, at various heights, from which a virtual temperature profile can be inferred. This thesis examines the effect of various environmental factors on the performance of such a Radio-Acoustic Sounding System (RASS). A simple expression for the RASS echo power in the form of a radar equation has been derived. The effects of horizontal winds, turbulence, vertical temperature gradients, and a displacement of the acoustic source from the radar have been included. Previous developments considered only pieces of the total problem. The development here unifies and extends earlier work. A RASS comprising a monostatic pulsed Doppler radar and a band-limited acoustic source was analyzed theoretically for the first time. Previous results based on uniform turbulence profiles were extended to include realistic profiles. The effect of a vertical temperature gradient, which was studied only numerically in the past, is described analytically here. The accuracy of the RASS temperature retrievals was also theoretically examined. An analytic expression for the temperature error that includes all of the above effects was developed. The contribution of turbulence to this error was identified and quantified for the first time. Multiple acoustic sources are often used in RASS to enhance the height coverage. No analytic description of such systems had previously existed. The development was extended to include multiple acoustic sources and the expected enhancement was theoretically confirmed. The effect of multiple acoustic sources on the error in the temperature retrieval was also investigated. The ability of a wind-profiler/RASS to measure mean winds and temperatures is well documented. In contrast there have been few studies investigating how well such a system can measure wind and temperature variances, and fluxes. Vertical wind and temperature spectra and heat flux cospectra, obtained from sonic anemometer and windprofiler/RASS time series were compared. The agreement was poor suggesting the need for more comparative studies to identify sources of error. Dissert. Abstr.

TROPOSPHERIC RADIATIVE FORCING OF O3 FOR THE 1994 IPCC REPORT
A. S. Grossman, K. E. Grant, and D. J. Wuebbles 22 Sep. 1993 9 p
(Contract W-7405-eng-48)
(DE94-005698; UCRL-ID-115827) Avail: CASI HC A02/MF A01

We have determined the tropospheric radiative forcing of O3 in the 175 to 735 nm (UV-visible) wavelength range plus the 500 to 1650 cm(exp -1) (infrared) wavenumber range in accordance with a set of IPCC test cases provided to all interested modeling groups. The atmospheric test cases involved perturbed ozone scenarios in a McClatchey midlatitude summer, clear sky, model atmosphere. A new short wave radiative transfer code has been developed to calculate the radiative forcing in the 175 to 735 nm wavelength range. The IR radiative forcing was calculated using a correlated k-distribution transmission model. The tropospheric radiative forcing values obtained for the IR spectral region and the UV-visible spectral region lie in the middle of the range of preliminary values submitted from all of the models used in the IPCC test calculations. DOE

ANALYSIS OF DEEP SEISMIC REFLECTION AND OTHER DATA FROM THE SOUTHERN WASHINGTON CASCADES Quarterly Report, 1 Mar. - 31 May 1993
W. D. Stanley (Geological Survey, Reston, VA.) 1994 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AT21-92MC-29267)
(DE94-005915; DOE/MC-29267/3523) Avail: CASI HC A02

This report covers the period 1 Mar. - 31 May 1993. The overall goals of the program task are to provide a final synthesis of six deep seismic reflection profiles and other geological and geophysical data from the southern Washington Cascades region where a probable extensive deep sedimentary basin has been discovered. This deep sedimentary basin is hypothesized from geological, regional magnetotelluric (MT), gravity, magnetic, and seismic reflection data. This report analyzed three seismic reflection profiles acquired by the Morgantown Energy Technology Centers in combination with the extensive MT and other data to outline a probable geological model for a thick conductive section of rocks in the southern Washington Cascades (called the Southern Washington Cascades conductor, SWCC). Earlier MT models suggested that the section consisted of an east-dipping package that extended to depths of as much as 20 km but appeared to surface in the Bear Canyon area near Morton, Washington, and along the axis of the Carbon River and Morton anticlines. Interpretation of the first three DOE seismic reflections approximately confirmed the MT interpretation and added new information on anticlinal structures and detailed stratigraphy. In this quarterly report, we summarize the progress over the first two quarters of the program for FY93, and project the possible findings during the remainder of the project. DOE

GEOCHEMICAL AND FLUID DYNAMIC INVESTIGATIONS INTO THE NATURE OF CHEMICAL VARIABILITY IN THE EARTH'S MANTLE Ph.D. Thesis
Erik Harold Hauri 1992
Avail: Issuing Activity (MIT Libraries, Rm. 14-0551, Cambridge, MA 02139-4307)

This dissertation examines the trace element and isotope geochemistry of mantle peridotites and oceanic island basalts, and studies aspects of the flow of viscous fluids driven by thermal buoyancy. The trace element and isotopic systematics of peridotites and associated mafic layers from the Ronda Ultramafic Complex, southern Spain (Chapter 2), provides information bearing on the geochemical behavior of the highly incompatible elements U, Th, and Pb in the mantle, and on the length scales of geochemical variability in a well exposed peridotite massif. The isotopic evolution of Ronda is consistent with an origin as ancient (3 Ga) MORB source mantle which experienced a partial melting event at 1.3 Ga ago, and was subsequently incorporated into the subcontinental lithosphere. An investigation of the trace element and isotopic compositions of clinopyroxenes in peridotite xenoliths from Savaii, Western Samoa and Tubuai, Austral Islands (Chapter 3) reveals geochemical signatures which are not present in basalts from these islands, due to the inherent averaging of melting processes. The data indicate similarities in the melting and melt segregation processes beneath these isotopically extreme islands. A large majority of the xenolith clinopyroxenes from both Savaii and Tubuai are LREE enriched to varying degrees, and many samples display significant intergrain trace element heterogeneity. This highly variable yet systematic heterogeneity was the result of metasomatism by percolating melts undergoing chromatographic trace element fractionation. The Re-Os isotope systematics of oceanic island basalts from Rarotonga, Savaii, Tahaa, Rurutu, Tubuai, and Mangaia are examined (Chapter 4). Results indicate that the low-temperature alteration signature of altered oceanic crust may be largely removed during subduction, and that oceanic crust was recycled into the lower mantle source of the Macdonald hotspot plume. A fluid dynamic model for mantle plumes is developed (Chapter 5) by examining a vertical, axisymmetric boundary layer originating from a point source of heat, and incorporating experimentally constrained rheological and physical properties of the mantle. Examination of the global isotopic database for oceanic island basalts reveals the presence of a mantle component (FOZO), common to many hotspots worldwide, characterized by depleted (87)Sr/(86)Sr and (143)Nd/(144)Nd, radiogenic (206, 207, 208)Pb/(204)Pb and high (3)He/(4)He. This component is isotopically distinct from the source of MORB; thus, with the exception of ridge centered hotspots such as Iceland and the Galapagos, upper mantle does not appear to be a component in most hotspots, in agreement with entrainment theory. Dissert. Abstr.

A LABORATORY SIMULATION OF URBAN HEAT-ISLAND-INDUCED CIRCULATION IN A STRATIFIED ENVIRONMENT Ph.D. Thesis
Jie Lu 1993 190 p
Avail: Univ. Microfilms Order No. DA9317117

A three-dimensional heat-island model is established in the convection tank of the Fluid Modeling Facility, U.S. Environmental Protection Agency. Water is used as the working fluid. The model is capable of simulating the temperature and velocity fields induced by a low-aspect-ratio heat island in a calm and stably stratified environment. The convective circulation is turbulent and the Froude number is found to be the controlling parameter

when Reynolds number independence holds. The differences between low- and high-aspect-ratio plumes are discussed and two analytical models, the bulk convective model and the hydrostatic model, are developed for low-aspect-ratio plumes to predict the plume heights, heat-island intensities, and velocity distributions. An extensive and systematic study is conducted to study the heat-island-induced flow with different underlying surface heating rates, heat-island sizes, and different ambient temperature gradients. Different parameterizations and scalings for the heating process, stability effects, velocity fields, and turbulent characteristics are studied, as well as the limitations of the experimental technique. The experimental results are compared with field observations from several cities, previous numerical simulations, and predictions of the analytical models. Good agreement is found with proper convective scalings. The experimental results in their non-dimensional forms, including the thermal plume height, equilibrium height, flow-reversal height, heat-island intensity, the mean horizontal and vertical velocity distributions, and the statistics of temperature and velocity fluctuations, may be applied to any low-aspect-ratio thermal plumes.

NEW PARAMETERS FOR CHARACTERIZING TURBULENCE AT A POTENTIAL WIND SITE
L. L. Wendell, J. C. Barnard, and V. R. Morris Jul. 1993 11 p Presented at the Windpower 1993, San Francisco, CA , 12-16 Jul. 1993
(Contract DE-AC06-76RL-01830)
(DE94-004355; PNL-SA-22124; CONF-930726-7) Avail: CASI HC A03/MF A01

The most widely used parameter for characterizing turbulence at a potential wind turbine site has been the quantity called 'turbulence intensity' (TI). Analyses of data from several sites in the US Department of Energy's Turbulence Characterization Project show that this parameter can sometimes be seriously misleading. This project has produced a data base of three-component wind turbulence at four strategic locations over a rotor disk in different types of complex terrain. The 0.2-s sampling interval of the data from the four anemometers makes it possible to compute a composite wind over the rotor disk, as well as the wind experienced at a point on a rotating wind turbine blade. From considerations of specialized plots of these wind data, the authors have introduced engulfing gust (TEG) and fluctuating shear (TFS) turbulence parameters and compared their behavior with TI over a range of wind speeds at sites with different terrain configurations. The comparisons showed TEG and TFS to be somewhat more discriminating than TI of the nature of the turbulence at different sites. To obtain a more complete understanding of the nature of the turbulence and its relationship to upwind terrain features, shaded relief and cross-section analyses were applied to provide an overview of the upwind fetch. Using these analyses, along with the time-series plots of wind speed, allowed us to detect eddies being shed from an upwind feature at one site, and to detect a subtle difference in ridge configuration between two sites that resulted in flow separation at one site, but not at the other.

ON EDDY ACCUMULATION WITH LIMITED CONDITIONAL SAMPLING TO MEASURE AIR-SURFACE EXCHANGE
M. L. Wesely and R. L. Hart 1994 5 p Presented at the 74th American Meteorological Society Annual Meeting, Nashville, TN, 23-28 Jan. 1994
(Contract W-31-109-eng-38)
(DE94-005112; ANL/ER/CP-80341; CONF-940115-19) Avail: CASI HC A01/MF A01

An analysis of turbulence data collected at a height of 12.3 m above grasslands was carried out to illustrate some of the limitations and possible improvements in methods to compute vertical fluxes of trace substances by the eddy accumulation technique with conditional sampling. The empirical coefficient used in the technique has a slight dependence on atmospheric stability, which can be minimized by using a threshold vertical velocity equal to approximately 0.75 sigma(sub w), below which chemical sampling is suspended. This protocol results in a smaller chemical sample but increases the differences in concentrations by approximately 70%. For effective conditional sampling when mass is being accumulated in a trap or reservoir, the time of sampling during updrafts versus downdrafts should be measured and used to adjust estimates of the mean concentrations.

CATALOG OF AIR FORCE WEATHER TECHNICAL PUBLICATIONS 1992-1993
Jan. 1994 38 p
(AD-A275635; USAFETAC/TC-94/001) Avail: CASI HC A03/MF A01

This catalog lists unclassified technical publications produced by HQ Air Weather Service (AWS) and its three centers from Jan. 1992 through Dec. 1993. It supplements, but does not supersede AWS/TC-91/001, which lists technical documents produced by or for AWS and its subordinate units from 1941 through 1991. Documents listed in this catalog include technical reports, technical notes, data summaries, project reports, forecaster memos, interactive training programs, microcomputer programs, and subject bibliographies.

CAPABILITIES, PRODUCTS, AND SERVICES OF USAFETAC (USAF ENVIRONMENTAL TECHNICAL APPLICATIONS CENTER)
Jan. 1994 35 p
(AD-A275654; USAFETAC/TN-94/0001) Avail: CASI HC A03/MF A01

This document describes the capabilities, products, and services of the USAF Environmental Technical Applications Center (USAFETAC), an agency that creates, maintains, and applies the Air Force's environmental climatological database. It describes USAFETAC products and services and tells how to request them. It describes the climatic database and

USAFETAC computer assets. It discusses USAFETAC mission and organization. Appendices provide request formats, Dial-In applications, and a history of USAFETAC and military climatology. DTIC

A GLOBAL FORECAST MODEL COMPARISON STUDY - YEAR 1
Thomas Nehrkorn, Mark Mickelson, Lawrence W. Knowlton, and Marina Zivkovic 15 Sep. 1993 46 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-92-C-0092)
(AD-A275674; PL-TR-93-2203) Avail: CASI HC A03

This report describes the results of the first 15 months of a two-year effort aimed at evaluating the advanced physics global spectral model (APGSM) developed by the Phillips Laboratory, in comparison with the currently operational GSM at Global Weather Central (GWC). Preliminary results from the verification of forecasts from the GWC GSM and APGSM, using the GWC analyses as a reference, are presented. The compaction and analysis of RTNEPH cloud data in preparation for generating and verifying cloud forecasts from the APGSM are described. The development of a cloud forecast scheme based on an application of the cloud curve algorithm to synoptically defined weather regimes is described. DTIC

US NATIONAL WEATHER EXPERIMENT STORM-FEST: WAVES AND TURBULENCE IN FRONTAL ZONES Final Report, 1 Jan. 1992 - 31 Dec. 1993
William Blumen 23 Dec. 1993 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0137)
(AD-A275084; AFOSR-94-0004TR) Avail: CASI HC A01

A high density of surface and upper air observations, including aircraft observations, were accumulated during the STORM-FEST field campaign in the central United States (1 February - 13 March 1992). These data were analyzed to identify significant internal gravity wave and turbulent activity that occurred in association with low-level frontal passages through the boundary layer. The principal analysis method was local decomposition using wavelets as basis functions. These functions provided information on both scale and translation of coherent events, and were well-suited for frontal and boundary layer analyses. Dissipation of kinetic energy in frontal zones was determined using data obtained during STORM-FEST. This information was used to interpret some of the physical processes in low-level frontal zones, but specific models of the observed events were not constructed. DTIC

NUMERICAL SIMULATIONS OF A MOUNTAIN THUNDERSTORM. A COMPARISON WITH DOPPLER RADAR OBSERVATIONS M.S. Thesis
Mark E. Raffensberger 4 Nov. 1993 236 p
(AD-A275296; AFIT/CI/CIA-93-155) Avail: CASI HC A11/MF A03

A two-dimensional, non-hydrostatic cloud model was used to isolate the processes and initial conditions most important in the initiation and development of a small mountain thunderstorm. Six numerical simulations were conducted -- one control and five experiments. The control simulation was conducted with realistic initial conditions and physical processes. The simulation's accuracy was evaluated by comparison to multiple-Doppler radar analyses of a storm that occurred on 31 July, 1984 near Langmuir Laboratory, New Mexico and to a microphysical retrieval conducted for a different, but similar storm. The other five simulations were conducted to test the sensitivity of the simulated storms to the initial wind profile, the lack of solar heating, restriction to warm rain processes, and the initial moisture profile. Comparison of the evolution of the control's simulated storm with observation sand with the microphysical retrieval show that the simulation accurately captured the major features observed by the radars and accurately depicted the microphysical evolution of the storm cells. The results of the numerical experiments showed the following conditions and processes to be most important (in descending order) to the development and maintenance of the storm: solar heating, ice phase microphysical processes, environmental wind profile, and low-level moisture profile. The environmental wind profile was the single most important factor in the convective initiation location. DTIC

ON THE ORIGINS OF LOW-LEVEL TORNADIC CIRCULATIONS WITHIN THE REMNANTS OF HURRICANE ANDREWS M.S. Thesis
Steven T. Fiorino Sep. 1993 78 p
(AD-A275373; AFIT/CI/CIA-93-148) Avail: CASI HC A05/MF A01

A literature review establishes a key characteristic of tornadic hurricane environments to be the highly sheared lowest 1500 m. The thesis proposes that the shear-produced horizontal vorticity is turned vertical mainly via vertical velocities induced by mass convergence in boundary layer wind-shift zones, rather than by buoyant updrafts. A two dimensional mass continuity and convective available potential energy analysis is performed on data from a profiler and acoustic sounder exposed to Hurricane Andrew's tornadic remnants. This analysis suggests the presence of a convergence-produced 5 m/s updraft at a wind-shift in the thermodynamically stable boundary layer of a tornadic rainband. DTIC

Because of large space and time scales involved, oceanic convective motions (which may take the form of plumes and thermals) are expected to be influenced by the background rotation. These rotational effects may arise either due to the earth's rotation or due to the presence of a parent cyclone. Thus, the understanding of oceanic convection requires a good knowledge on the influence of rotation on convection from isolated sources. DTIC

ERROR GROWTH IN POOR ECMWF FORECASTS OVER THE CONTIGUOUS UNITED STATES M.S. Thesis
Norman R. Modlin 9 Dec. 1993 93 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275297; AFIT/CI/CIA-93-154) Avail: CASI HC A05

Successive improvements to the European Center for Medium-range Weather Forecasting model have resulted in improved forecast performance over the contiguous United States (CONUS). While the overall performance of the model in this region was found to have improved during the period of the 1981-1990 winter seasons, the number of poor forecasts increased over this time. This study uses the root mean square (RMS) error to measure the performance of five-day 500 mb winter forecasts over the CONUS. Poor and good forecasts were defined in terms of the 10-year distribution of the RMS values between the 1981 and 1990 winter seasons. Subjective analysis of a subset of poor forecasts yielded no obvious patterns of error growth, location, or propagation in the evolution of poor forecasts. A tendency was noted for in situ amplification of forecast errors. Additionally, successive forecasts verifying on the same day were found to have similar error patterns, with increased amplitudes at longer forecast lengths. This implies that the initial conditions are not a significant source of the error in poor forecasts. DTIC

PROTOTYPE TERMINAL AERODROME FORECASTS USING A MESOSCALE MODEL M.S. Thesis
Benjamin I. Edwards, II 1993 73 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275308; AFIT/CI/CIA-93-156) Avail: CASI HC A04

The purpose of this study is to evaluate the potential of the Regional Atmospheric Modeling System (RAMS) in this configuration to develop a prototype terminal aerodrome forecast (TAF). RAMS was developed at Colorado State University and is being used to simulate convection over central Florida using a nested grid model where the smallest grid has a horizontal spacing of five kilometers. To obtain meaningful results a 2.5w cumulus parameterization scheme was used which is different than the traditional schemes. The model performed a 12 hour simulation. The coarse grid had a horizontal grid spacing of 80 kilometers and covered the southeastern United States. The second grid has a horizontal grid spacing of 20 kilometers. The third grid was centered over the Kennedy Space Center, Florida. The placement and size of the third grid was used to

evaluate the usefulness of producing model-aided TAF's. One of the problems facing the forecasting community is how to prepare a TAF, the aviation communities forecast, with the current numerical weather prediction products. The NGM parameterizes convection on this scale while the 2.5w parameterization can explicitly resolve features on the five kilometer scale. This increased resolution will greatly aid in the production of aviation forecast. As a demonstration the RAMS model output will be used to produce a TAF for Kennedy Space Center. DTIC

STUDY OF DYNAMIC CHARACTERISTICS OF A MONSOON CIRCULATION TUBE

Xu Xiangde and Yin Shuxin 10 Dec. 1993 22 p Transl. into ENGLISH from Jifeng Liuguan Donglixue Tezheng Yanjiu, Qixiang (Meteorology), v 49, no. 1, Feb. 1991 p 108-115

(AD-A275238; FASTC-ID(RS)T-0332-93) Avail: CASI HC A03/MF A01

In China with a prevailing summer monsoon, there is often on mainland China a shear line with east-to-west trend, or a quasistationary rainfall belt on the northern side of a subtropical high pressure. There is ascending movement along the rainfall belt; however, there is a subtropical high ridge line with east-to-west trend to the south of the shear line or the quasistationary front rain belt. Between the shear line and ridge line, there is a meridian circulation system with ascending movement in the north and descending movement in the south. The structure of this (more than 1000 kilometers long, in an east-to-west direction) secondary vertical circulation system is like a tube with east-to-west trend. In this article, the tubular secondary meridionally vertical circulation system (along the east-to-west trend shear line or quasistationary front cloud and rain belt) in summer on mainland China is called the monsoon circulation tube. Its characteristics reveal the configuration relationship and mutual correlation of easterly and westerly air currents, as well as subtropical high systems in the East Asia monsoon zone. DTIC

ON THE RELATION BETWEEN SMMR 37-GHz POLARIZATION DIFFERENCE AND THE RAINFALL OVER AFRICA AND AUSTRALIA

Bhaskar J. Choudhury and Nicolo E. DiGirolamo Mar. 1994 82 p

(NASA-TM-104598; Rept-94B00049; NAS 1.15:104598) Avail: CASI HC A05/MF A01

A major difficulty in interpreting coarse resolution satellite data in terms of land surface characteristics is unavailability of spatially and temporally representative ground observations. Under certain conditions rainfall has been found to provide a proxy measure for surface characteristics, and thus a relation between satellite observations and rainfall might provide an indirect approach for relating satellite data to these characteristics. Relationship between rainfall over Africa and Australia and 7-year average (1979-1985) polarization difference (PD) at 37 GHz from scanning multichannel microwave radiometer (SMMR) on board the Nimbus-7 satellite is studied in this paper. Quantitative methods have been used to screen (accept or reject) PD data considering antenna pattern, geolocation uncertainty, water contamination, surface roughness, and adverse effect of drought on the relation between rainfall and surface characteristics. The rainfall data used in the present analysis are climatologic averages and also 1979-1985 averages, and no screening has been applied to this data. The PD data has been screened considering only the location of rainfall stations, without any regard to rainfall amounts. The present analysis confirms a non-linear relation between rainfall and PD published previously. Author

[ACTIVITIES REPORT OF THE INTERNATIONAL METEOROLOGICAL INSTITUTE] Annual Report, Jul. 1992 - Jun. 1993

Aug. 1993 69 p

(ISSN 0349-0068)

(ETN-94-95524) Avail: CASI HC A04/MF A01

The annual report of the International Meteorological Institute of Sweden which conducts research in meteorology and associated fields and promotes international scientific cooperation within meteorology is presented. The following are covered: international activities; research activities; visiting scientists; staff members, finances; and publications and reports. Four research areas are covered: dynamic meteorology (mesoscale circulation and synoptic large scale dynamics); chemical meteorology (precipitation chemistry, trace gas exchange between the atmosphere and the underlying surfaces, modeling of tropospheric chemistry, and the global carbon cycle); atmospheric physics (minor constituents, airglow studies, studies of the mesopause region, and stratospheric composition studies); and atmospheric aerosol science (airborne particles and CO2, cloud physics and chemistry, and ice core research). TIME SERIES COMPARISONS OF SATELLITE AND ROCKETSONDE TEMPERATURES IN 1978-1979

Ellis E. Remsberg, Praful P. Bhatt, and Francis J. Schmidlin Apr. 1994 139 p

(RTOP 579-21-44-70)

(NASA-TP-3409; L-17250; NAS 1.60:3409) Avail: CASI HC A07/MF A02

The Limb Infrared Monitor of the Stratosphere (LIMS) experiment on Nimbus 7 yielded temperature-versus-pressure (T(p)) profiles for each radiance scan. The present report describes time series comparisons between LIMS and rocketsonde T(p) values at rocketsonde station locations. Sample size has increased up to 665 by this new approach, leading to better statistics for a T(p) validation. The results indicate no clearly significant bias for LIMS versus Datasonde from 10 kPa at low and mid latitudes. There is a positive LIMS bias of 2 to 3 K in the upper stratosphere at high latitudes for the Northern Hemisphere in both winter and spring. LIMS is progressively colder than Datasonde from 0.4 kPa (about -3 K) to 0.1 kPa (about -9 K) at all latitudes. A similar comparison between LIMS and the more accurate falling sphere measurements reveals an equivalent mid-latitude LIMS bias at 0.4 kPa but a much smaller bias at 0.1 kPa (-4.6 K). Because the biases do not vary noticeably with season, it is concluded that they are not a function of atmospheric state. This result confirms the robustness of the LIMS temperature retrieval technique. Author

RADAR ESTIMATIONS OF ATMOSPHERIC WINDS IN THE TROPOSPHERE AND LOWER STRATOSPHERE Ph.D. Thesis

Emory Lamar Sheppard 1992 88 p

Avail: Univ. Microfilms Order No. DA9323828

This dissertation deals with the estimation of atmospheric flow field parameters using the spaced antenna (SA) and spatial interferometer (SI) methods. In the first section, a computer simulation of scattering from inhomogeneities in the refractive index is used to compare the SA and SI methods for measuring winds in clear air both with and without turbulent fading. The results show that the SA analysis which is carried out in the time domain and the SI analysis which is carried out in the frequency domain are equivalent in terms of the information that the two methods yield. A data analysis method equivalent to full correlation analysis, which can be carried out in the frequency domain, is presented. The method is applied to model-generated data in order to extract the typical full correlation analysis output parameters such as the apparent and true velocities. The results obtained are consistent with the model input parameters. In the second section a statistical comparison of the SA and SI methods for estimating horizontal winds in the troposphere and the lower stratosphere is presented. The data analyzed were obtained with the Middle and Upper (MU) atmosphere radar from 1910 LT on June 29, 1990, through 0950 LT on July 2, 1990. At all heights, velocity estimates based on frequency domain data are within 4 percent of those based on time domain data. We conclude that frequency domain techniques provide an alternate method for estimating true horizontal velocity. Nevertheless, it is not clear that they offer any significant advantage over time domain methods. In fact, the results obtained indicate that the SI method for estimating horizontal velocity may be slightly more difficult to apply in practice. The final section presents an analytical evaluation of SA-based instrumental setups with the potential for estimating the vertical component of atmospheric vorticity from a single-radar location. Methods considered are the oblique spaced antenna (OAS) method and a modified SA system employing four vertically-pointed receiving antennas. Analogies are drawn between the Doppler and SA methods, and it is concluded that the two systems gather the same information when atmospheric turbulence is small and the

reflectivity is uniform. Furthermore, it is concluded that under normal conditions measurement uncertainties will preclude the estimation of atmospheric vorticity from a single-radar location. Dissert. Abstr.

THE DYNAMICS OF TROPICAL INTRASEASONAL VARIABILITY Ph.D. Thesis
Benjamin Paul Kirtman 1992 302 p
Avail: Univ. Microfilms Order No. DA9315666

The dynamics of tropical intraseasonal variability is theoretically examined with a hierarchy of numerical and analytical models. We investigated the relative roles of conditional instability of the second kind (CISK), the evaporation-wind (E-W) feedback, positive only heating, and nonlinear dynamics. The two problems that plague our understanding of the 30 to 60 day oscillation is the predominance of the planetary scales and the slow phase speed of propagation. Current observation evidence indicates that moist Kelvin wave dynamics may address these problems. A linear analytical twelve-layer model is developed that, for the first time, considers the destabilization of Kelvin waves due to both CISK and the E-W feedback simultaneously. A surface easterly E-W feedback excites modes that are deeper and faster than their CISK counterparts. Numerical calculations with a quasilinear model (positive only heating) shows that the E-W feedback serves as a catalyst in exciting wave-CISK modes that would otherwise be damped. The conceptual model of the E-W feedback is modified to reflect the fact that a surface easterly (westerly) E-W feedback increases (decreases) the phase speeds of the wave-CISK modes. Scale selection experiments with the quasilinear model indicate that in the case of CISK only any horizontal scale can dominate but the global mode is the most unstable. In the case of a strong surface easterly E-W feedback only a global mode can be supported. A fully nonlinear model is presented that incorporates both the wave-CISK and E-W feedback mechanisms. Two regimes are identified: one that behaves similarly to the quasilinear model and the second that is highly nonlinear. In the second regime the propagation speeds are very fast (10 day period) and a wave number one eastward propagation modulates multiple precipitation events along the equator. In either regime regardless of the initial condition the solution always cascades to a wavenumber one dominated solution. Finally, an 'aqua-planet' model is presented in which both nonlinear regimes can be identified. The effects of the E-W feedback enhance the wave-CISK mechanism and nonlinear dynamics coupled with positive only heating leads to the wavenumber one dominance. Dissert. Abstr.

N94-29744 Utah Univ., Salt Lake City.
EVALUATION OF THE NATIONAL METEOROLOGICAL CENTER MESOSCALE MODEL FOR PREDICTION OF SEVERE CONVECTION OVER CENTRAL ARIZONA Ph.D. Thesis
Lawrence Bennet Dunn 1993 160 p
Avail: Univ. Microfilms Order No. DA9322404

The utility of numerical model guidance produced by the National Meteorological Center has been evaluated for the forecast of convection over central Arizona during the summer monsoon season. Model output from the nested grid model (NGM) and ETA model has been compared to observations taken during the 1990 field experiment referred to as the Southwest Area Monsoon Project (SWAMP). The NGM precipitation forecasts showed little skill for events in which heavy precipitation was observed over Phoenix, Arizona. Synoptic-scale rising motion associated with the heavy rain events was best identified in gridded model output in terms of differential advection of absolute vorticity between 300 and 500 mb, but the NGM correctly predicted these fields only 50 percent of the time. Selected events during the SWAMP period were simulated using the ETA model. Qualitative comparisons of the ETA model's precipitation forecasts with lightning data and satellite imagery suggest that the model has skill in predicting precipitation 12 to 24 hours in advance in areas to the east of the Rockies and over Mexico. However, precipitation forecasts from the ETA model showed little skill over central Arizona as a result of inaccurate lower tropospheric moisture fields and the model's inability to trigger convection. The moisture field over southern Arizona was inaccurately forecast since the model generated an unrealistically strong sea-breeze circulation in the vicinity of the Gulf of California. Insufficient moisture in the lower troposphere over Arizona inhibited the development in the model of the strong convective instability observed prior to the onset of convection. However, in some cases, the ETA model correctly predicted the vertical profile of temperature and moisture observed over central Arizona just prior to the outbreak of severe convection, but was still unable to predict any precipitation. The convective parameterization used in the ETA model was not able to generate precipitation in the arid environment over Arizona in which the relative humidity rarely exceeds 80 percent in the lower troposphere prior to the onset of convection. It is theorized that the lack of evaporative cooling processes in the model prohibits the development of colliding outflow boundaries that may initiate the severe convection in this region. Dissert. Abstr.

PHYSICAL PROCESSES ASSOCIATED WITH VARIABILITY IN SUCCESSIVE OPERATIONAL MODEL FORECASTS OF CYCLOGENESIS Ph.D. Thesis
Paul J. Roebber 1991 209 p
(ISBN-0-315-74753-6) Avail: Univ. Microfilms Order No. DANN74753

Cyclogenesis is examined based on the principle that development can be viewed as an interaction between upper and lower cyclonic disturbances, and that the surface response is related to the magnitude of both disturbances. It is shown that variability in successive operational model forecasts results from variations in the representation of the features at both levels, but that particular predictions can be sufficiently realistic for diagnostic purposes. The variability in two successive forecasts of a specific case is explained as a moist baroclinic response modulated by the growth of low-level cyclonic vorticity prior to the period of rapid deepening. This antecedent vorticity growth came about through a self-development mechanism involving an interaction between quasigeostrophic processes, surface energy fluxes, and warm-frontal latent heat release. In order to define the preconditioning for this case, it is necessary to resolve these processes, interacting on both meso and synoptic scales. Dissert. Abstr.

N94-29753 Oklahoma Univ., Norman.
DYNAMICS OF TORNADO-LIKE VORTICES Ph.D. Thesis
Litao Deng 1993 326 p
Avail: Univ. Microfilms Order No. DA9323659

Several important processes related to the tornado-like vortex are studied. Those are vortex breakdown, turbulence with rotation and helicity, vortex stability, generation of tornado-like vortices and nondimensional parameters. Both axisymmetric and three-dimensional vortex breakdown are simulated numerically. A mechanism for the breakdown is proposed after unsuccessful applications of existed theories. An investigation of vortex stability shows that the vortex jet under the breakdown point is unstable to asymmetric disturbances. The most unstable wavenumber is 1. The oscillation of the breakdown point observed in laboratory is explained consequently. The effects of rotation and helicity on turbulence decay is studied as an attempt to provide guidance on tornado dynamics in a turbulent environment. Tornado genesis is investigated by simulating and extending the Rothfusz-Lilly experiment. The role of downdraft introduced by secondary circulation is emphasized. The nondimensional parameters governing the laboratory vortex flow is discussed. A new definition for the swirl ratio is proposed and tested. Also, a treatment of the corner point in staggered grids and a nesting method to simulate the core flow are provided in the description of various numerical models developed in the thesis. Dissert. Abstr.

N94-29763 Hawaii Univ., Honolulu.
ON THE ANNUAL CYCLE OF THE TROPICAL PACIFIC ATMOSPHERE

AND OCEAN Ph.D. Thesis
Tianming Li 1993 135 p
Avail: Univ. Microfilms Order No. DA9325038

A simple climate model is proposed for studying the key parameters of the coupled ocean-atmosphere system, monthly mean surface winds and precipitation. In this model, sea-level pressure is thermodynamically determined from sea surface temperature (SST) through a vertically integrated hydrostatic equation in which the vertical mean lapse rate is a function of SST plus a time-independent correction. The surface wind are then computed from the sea-level pressure gradients through a linear surface momentum balance with the anisotropic and latitude-dependent Rayleigh friction coefficients. The precipitation is calculated from a moisture budget by taking into account the effect of SST on convective instability. This model is capable of simulating a realistic annual cycle of the surface winds, sea-level pressure, and precipitation over the tropical Pacific. The response of the tropical atmosphere to symmetric and antisymmetric SST forcing is examined using the simple model. It is found that the annual variation of the symmetric SST mode results in the westward propagation of the surface zonal wind, sea-level pressure, and precipitation along the equator and the antisymmetric SST variation causes the seasonal oscillation of monsoonal circulations and rainfall. The mechanisms of annual variations of the tropical Pacific sea surface temperature are investigated using a reduced-gravity ocean model. It is found that the westward propagation of the equatorial SST anomaly is due to wind-related dynamic processes. Therefore, the westward propagation of atmospheric and oceanic quantities is a manifestation of coupled air-sea interaction. The initiation of anomalous warming or cooling in the eastern Pacific, however, is primarily due to the northward propagation of the SST anomaly in response to solar radiation forcing. As a result, the annual variation of the Pacific SST can be regarded as an interplay between coupled air-sea interaction and solar radiation forcing. The remote forcing of anomalous winds in the western Pacific also shows contribution on the SST variation in the eastern Pacific. The annual variation of cloudiness has effects on the change of SST in the western Pacific and the northeastern Pacific monsoon region.

DOWNSTREAM DEVELOPMENT OF BAROCLINIC WAVES Ph.D. Thesis
Edmund Kar-Man Chang 1993 279 p
Avail: Univ. Microfilms Order No. DA9316091

Downstream development of baroclinic waves is studied using models and observations. Localized perturbations in a baroclinic basic state spread out towards the downstream (and upstream) direction by radiation of energy via ageostrophic geopotential fluxes. The energy budget of these perturbations is examined, and it is found that their growth is triggered by the convergence of ageostrophic geopotential fluxes radiated from upstream (downstream) disturbances, while their decay stage is dominated by downstream (upstream) radiation of energy, with baroclinic and barotropic conversion playing only secondary roles. Such a behavior is different from the traditional baroclinic growth/barotropic decay life-cycle propounded in studies of waves which grow from the most unstable linear normal mode. A variable Coriolis parameter and surface friction both act to favor downstream over upstream development. Downstream development of baroclinic waves in zonally inhomogenous environments are studied to understand the energetics and maintenance of storm tracks. In experiments with zonally varying baroclinicity introduced by zonal variations in heating, it is found that eddies grow due to baroclinic conversion over regions with high baroclinicity and then form coherent wave groups through downstream development. These wave groups propagate into regions with weak baroclinicity and extend the storm track deep into such regions. An eddy kinetic energy equation is derived using simple parametrizations of the various sources and sinks to diagnose the zonal distribution of eddy kinetic energy in a storm track. The effects of mountains on eddy distribution is examined briefly. Apart from generating stationary waves which modulate the baroclinicity of the atmosphere, it is found that mountains may directly affect eddies by reducing their vertical phase tilt, making them less efficient in extracting energy from the mean flow and producing a minimum in eddy activity directly over the mountain. Atmospheric observations analyzed by the European Centre for Medium Range Weather Forecasting are examined. Synoptic scale waves in the Northern Hemisphere storm track regions are found to display a clear signal of downstream development, and their energy budgets are very similar to those found in modeling studies.

A STUDY OF CLOUD-TO-GROUND LIGHTNING PROCESSES WITH EMPHASIS ON DATA ANALYSIS AND MODELING OF THE RETURN STROKE Ph.D. Thesis
Rajeev Thottappillil 1992 255 p
Avail: Univ. Microfilms Order No. DA9314302

Properties of cloud-to-ground lightning are determined from electric field and optical records of natural lightning flashes and from electric field, current, and optical records of triggered-lightning flashes. Some of these results are used to compare existing return stroke models, develop two new return stroke models, and model continuing currents and M-components. Analysis of electric field records of natural lightning in conjunction with multiple station TV images of the lightning channel has yielded new properties of natural lightning which impact lightning protection standards. Lightning return stroke current parameters and other flash current parameters have been determined from the currents recorded at the base of the channel during triggered-lightning experiments. Current pulses during continuing current have been correlated with the corresponding optical events in streak camera records showing that these current pulses, named M-current pulses, are associated with optical M-components. Properties of M-current pulses are given. Existing return stroke current models are compared by using simultaneous measurements of channel base currents, return stroke speeds, and remote electric fields from triggered lightning. The influence of the wave shape of the channel-base current on the model predictions are discussed. Measured return stroke currents having a maximum rate of rise occurring near the peak current tend to be associated with remotely measured electric fields having a very narrow spike at the field peak, while a maximum current rate-of-rise occurring earlier does not produce a remote field with such a spike. The Diendorfer-Uman model is generalized to include a varying upward return stroke speed with height and a varying downward discharge current speed with height. A new return stroke model is proposed which allows the calculation of spatial and temporal distribution of current along the channel for a specified current at the channel base and for any specified upward return stroke speed, downward discharge current speed, and discharge time constant, each as a different and arbitrary function of height. A model for continuing currents and M-components is developed. From the model it is inferred that the M-component wavefront travels from cloud to ground and not from ground to cloud.

AN OBSERVATIONAL AND NUMERICAL STUDY OF SEA/LAND-BREEZE CIRCULATIONS IN AN AREA OF COMPLEX COASTAL HEATING Ph.D. Thesis
Shiyuan Zhong 1992 162 p
Avail: Univ. Microfilms Order No. DA9311547

This dissertation presents an observational and a numerical study of sea/land-breeze circulations as well as a theoretical study on the boundary layer turbulence parameterization. Data from the Kennedy Space Center Atmospheric Boundary Layer Experiment have been used to examine the three dimensional structure of the mesoscale Atlantic sea/land-breeze and small-scale river-breeze circulations frequently occur over the area of Kennedy Space Center/Cape Canaveral (KSC/CC) where there exists irregular topographic features such as rivers and lagoons. Detailed characteristic features over a diurnal cycle of the circulation onset time, strength, depth, propagation speed, and both seaward and landward extensions are documented. Some boundary layer characteristics related to atmospheric diffusion including atmospheric stability, depth of the thermal internal boundary layer and its evolution with time, and turbulence mixing are also discussed. A three dimensional numerical mesoscale model is used to study the effects of synoptic forcing on the sea/land-breeze circulation at KSC/CC area. The sensitivity of mesoscale features to the large-scale background flow is explored by examining the low-level convergence field location, strength, and timing of maximum vertical motion; diurnal variation of depth of inflow layer and the thermal internal boundary layer; and the rotation of wind vector. Both of these studies may lead to not only an improved forecast of local weather and atmospheric diffusion of rocket exhausts at KSC/CC area, but also to a better understanding of

the physical mechanism of the thermally induced circulations, such as their dependence on the three dimensional coastal effects and the synoptic forcing. A new scheme for parameterizing the turbulent stress in terms of the mean wind profile is also presented in this dissertation. This new parameterization scheme is based on the balance of turbulence kinetic energy and is valid in a deeper layer than the constant-flux layer where the previous schemes all fail because of the violation of the fundamental assumption of constant turbulent fluxes. This new scheme may have direct impact on boundary layer and mesoscale modeling because it may improve the accuracy of solutions and also reduce the computation time by allowing a minimum number of vertical nodes needed to capture the sharp gradients near the low boundary. Dissert. Abstr.

THE INCORPORATION AND INITIALIZATION OF CLOUD WATER/ICE IN AN OPERATIONAL FORECAST MODEL Ph.D. Thesis
Qingyun Zhao 1993 215 p
Avail: Univ. Microfilms Order No. DA9323630

Quantitative precipitation forecasts have been one of the weakest aspects of numerical weather prediction models. Theoretical studies show that the errors in precipitation calculation can arise from three sources: errors in the large-scale forecasts of primary variables, errors in the crude treatment of condensation/evaporation and precipitation processes, and errors in the model initial conditions. A new precipitation parameterization scheme has been developed to investigate the forecast value of improved precipitation physics via the introduction of cloud water and cloud ice into a numerical prediction model. The main feature of this scheme is the explicit calculation of cloud water and cloud ice in both the convective and stratiform precipitation parameterization. This scheme has been applied to the eta model at the National Meteorological Center. Four extensive tests have been performed. The statistical results show a significant improvement in the model precipitation forecasts. Diagnostic studies suggest that the inclusion of cloud ice is important in transferring water vapor to precipitation and in the enhancement of latent heat release; the latter subsequently affects the vertical motion field significantly. Since three dimensional cloud data is absent from the analysis/assimilation system for most numerical models, a method has been proposed to incorporate observed precipitation and nephanalysis data into the data assimilation system to obtain the initial cloud field for the eta model. In this scheme, the initial moisture and vertical motion fields are also improved at the same time as cloud initialization. The physical initialization is performed in a dynamical initialization framework that uses the Newtonian dynamical relaxation method to nudge the model's wind and mass fields toward analyses during a 12-hour data assimilation period. Results from a case study showed that a realistic cloud field was produced by this method at the end of the data assimilation period. Precipitation forecasts have been significantly improved as a result of the improved initial cloud, moisture, and vertical motion fields. Dissert. Abstr.

COMPARISON OF SAVANNAH RIVER SITE'S METEOROLOGICAL DATABASES
A. H. Weber Jul. 1993 125 p
(Contract DE-AC09-89SR-18035)
(DE94-001751; WSRC-RP-93-269) Avail: CASI HC A06/MF A02

A five-year meteorological database from the 61-meter, H-Area tower for the period 1987-1991 was compared to an earlier database for the period 1982-1986. The amount of invalid data for the newer 87-91 database was one third that for the earlier database. The data recovery percentage for the last four years of the 87-91 database was well above 90%. Considerable effort was necessary to fill in for missing data periods for the newer database for the H-Area tower. Therefore, additional databases that have been prepared for the remaining SRS meteorological towers have had missing and erroneous data flagged, but not replaced. The F-Area tower's database was used for cross-comparison purposes because of its proximity to H Area. The primary purpose of this report is to compare the H-Tower databases for 82-86 and 87-91. Statistical methods enable the use of probability statements to be made concerning the hypothesis of no differences between the distributions of the two time periods, assuming each database is a random sample from its respective distribution. This assumption is required for the statistical tests to be valid. A number of statistical comparisons can be made between the two data sets, even though the 82-86 database exist only as distributions of frequency and mean speed. DOE

INTERANNUAL TEMPERATURE VARIABILITY AND CYCLONE FREQUENCY OVER EASTERN CANADA AND THE NEW ENGLAND STATES. A CASE STUDY: WINTER SEASONS 1931-1932 TO 1984-1985 Ph.D. Thesis
Mario Daoust 1992 212 p
(ISBN-0-315-74841-9) Avail: Univ. Microfilms Order No. DANN74841

Interannual variability of temperature and cyclone frequencies for Eastern Canada and the New England States have been investigated for the winter seasons 1931-32 to 1984-85. Seasonal analyses have revealed that cyclone frequency has decreased by 21 percent over the research area; the highest losses occurring over the Maritimes and the New England States (30 percent) and in the southern Quebec-southwestern Ontario region (31 percent). The seasonal average temperature has remained fairly stable during the research period. However, the Temperature Variability Index (TVI) suggests that the interannual variability of temperature has been through some changes since 1931-32. The latest shift indicates that, since the early seventies, the temperature variability appears to be increasing during the winter season. Half-month periods were analyzed which revealed some features of the climatic variability during the winter season since 1931-32. The average temperature for the first 15 days of January recorded a significant decrease over the last 54 years. On the other hand, the last half of February presented a general increase in temperature. Parallel to that, the last half of January and the first 15 days of February have recorded substantial decreases in cyclone frequency. Thus, these half-month periods reveal trends which indicate that the overall winter season of the mid-seventies-early eighties differs from the prevailing winter climatic conditions of the thirties and forties. Dissert. Abstr.

INTERANNUAL-DECADAL VARIABILITY IN TROPICAL CLIMATE SYSTEMS: STABLE ISOTOPE RECORDS AND GENERAL CIRCULATION MODEL EXPERIMENTS Ph.D. Thesis
Julia Ellen Cole 1992 324 p
Avail: Univ. Microfilms Order No. DA9313573

A thorough understanding of natural climate variability requires characterizing the patterns and causes of interannual-decadal climate change. The El Nino/Southern Oscillation (ENSO) system of the tropical Pacific imparts interannual variability to climate worldwide, but its past behavior remains poorly documented. Oxygen isotope records from corals that grew at Tarawa Atoll (1 N, 172 E) monitor regional rainfall variability driven by ENSO extremes, providing the ability to track past migrations of the Indonesian Low convective system. A 96-year coral delta(sup 18)O record correlates highly with large-scale ENSO indices, yielding a monthly-resolution ENSO record of comparable quality to measurements confirm the link between rainfall and seawater delta(sup 18)O at Tarawa. Ice-core isotopic records, though commonly interpreted as temperature proxies, incorporate the isotopic content of precipitation, which also depends on amount and seasonality of precipitation, conditions of water vapor evaporation and transport, and air mass mixing and stability. A 180-year record of delta D from the Dunde ice cap (Tibet) lacks consistent seasonality but displays large interannual changes. The delta D record does not show the trend to heavier values observed in a nearby core and interpreted as regional trace-gas-induced warming. The difference between cores and the disappearance of delta D seasonality imply that post-depositional processes dictate recent isotopic variability at Dunde. Alteration of the primary isotopic signal likely occurs by diffusion or wind scour, which would preferentially remove isotopically lighter species. General circulation models that include isotopic tracers in the hydrologic cycle may clarify the isotopic response to climatic change and improve paleoclimatic interpretation. Simulations of ENSO-related climate variability suggest that interannual temperature variations often occur via adjective changes. Changing advection alters the sources and transport of water vapor as well as local temperature and precipitation, complicating the isotopic response to climatic factors. In the tropics, simulated rainfall amount determines isotopic variability, in quantitative agreement with observations. Dissert. Abstr.

ON INTERANNUAL VARIABILITY AND CLIMATE CHANGE IN THE NORTH PACIFIC Ph.D. Thesis
David Kurt Salmon 1992 229 p
Avail: Univ. Microfilms Order No. DA9303404

Long term changes in the atmospheric and oceanic environment of the North Pacific were investigated for the period 1946-1991. A climatology of North Pacific wind stress curl was developed because of the relevance of changes in wind stress curl to both oceanic and atmospheric variability. The dominant scales of spatial and temporal wind stress curl variability were determined and examined within the context of observed changes in North Pacific air temperature, sea surface temperature (SST), sea ice cover, oceanic mass transport, and the occurrence of blocking anticyclones. Relationships between these variables and indices of tropical Pacific variability were also determined on interannual time scales. During 1976-1988, phase relationships were very strong between long term mean anomalies of wind stress curl, SST, air temperature, sea ice cover, the Pacific North American Index, the Southern Oscillation Index (SOI), and tropical Pacific SST. Long term mean anomalies of these parameters did not change sign during 1976-88. These strong phase relationships did not occur amongst these variables during any other period of the record. The 1976-1988 period is characterized by intensified storminess, the decreased occurrence of blocking anticyclones, and decreased sea ice cover in the subarctic North Pacific. Intensified atmospheric circulation also occurred in the western Pacific subtropical anticyclone. Anomalously low SST occurred across the central and western North Pacific during this period while anomalously high SST was present in the eastern North Pacific adjacent to North America. Changes in the sign of the long term mean anomalies of wind stress curl, central North Pacific SST, and the SOI suggest that this climate regime ended or relaxed after 1988. After 1975, long term changes in anomalies of the Southern Oscillation Index, tropical Atlantic wind stress, Sahel rainfall, and Greenland Sea ice cover have characteristics similar to those observed in the North Pacific. It is suggested that the climate anomalies observed in the North Pacific during 1976-1988 occurred as part of a hemispheric or global scale climate regime. Dissert. Abstr.

GLOBAL PATTERNS OF CLOUD OPTICAL THICKNESS VARIATION WITH TEMPERATURE AND THE IMPLICATIONS FOR CLIMATE CHANGE Ph.D. Thesis
George Tselioudis 1992 155 p
Avail: Univ. Microfilms Order No. DA9313699

This thesis presents a correlative analysis of cloud optical thickness and cloud temperature in large space and time scales. The analysis is designed to document and explain the patterns of cloud optical thickness variation with temperature, and to produce an understanding of cloud optical property feedbacks on climate change. The results of the global correlations between cloud optical thickness and temperature are presented in Chapter 1. The analysis focuses on low clouds to limit variations in cloud vertical extent, particle size and water phase. Coherent patterns of change are observed on several time and space scales. On the planetary and the seasonal scales, clouds in the colder latitudes and seasons are found to be optically thicker than clouds in the warmer latitudes and seasons. The seasonal, latitudinal and day-to-day variations of this relation show that in cold continental clouds optical thickness increases with temperature consistent with the temperature variation of the adiabatic cloud water content, but in warm continental and in most maritime clouds optical thickness decreases with temperature. In Chapter 2, a number of case studies are presented that attempt to identify the cloud parameters responsible for the optical thickness changes and to resolve the atmospheric processes that produce those changes. It is found that the temperature variation of low cloud optical thickness primarily reflect changes in the liquid water content of the clouds, and that changes in cloud particle size and vertical extent play a secondary role. In continental clouds, the optical thickness temperature relation changes from a positive to a negative slope at the same temperature range that the percentage of precipitating clouds shows a marked increase. It is proposed that an increase in the efficiency of formation of warm rain at higher temperatures relative to condensation, raises the probability of occurrence of optically thin clouds at warmer temperatures and produces the observed negative optical thickness slopes. In Chapter 3, a two dimensional radiative convective model is used to estimate the magnitude and sign of the feedback that the observed cloud optical thickness changes would produce in a climate warming scenario. A positive feedback is derived that increases the predicted 2 x CO2 warming by 1.5 C in the subtropics and by 0.5 C in the mid latitudes of the Northern Hemisphere. The latitudinal contrast in the strength of the feedback acts to negate the high latitude amplification of the greenhouse warming. Dissert. Abstr.

TEST OF PROTOTYPE LIQUID-WATER-CONTENT METER FOR AIRCRAFT USE Final Report
Hermann E. Gerber 12 Mar. 1993 99 p Sponsored in part by NASA. Goddard Space Flight Center
(Grant NSF ATM-92-07345; GSFC Proj. 913-44468)
(NASA-CR-189304; NAS 1.26:189304) Avail: CASI HC A05/MF A02

This report describes the effort undertaken to meet the objectives of National Science Foundation Grant ATM-9207345 titled 'Test of Prototype Liquid-Water-Content Meter for Aircraft Use.' Three activities were proposed for testing the new aircraft instrument, PVM-100A: (1) Calibrate the PVM-100A in a facility where the liquid-water-content (LWC) channel, and the integrated surface area channel (PSA) could be compared to standard means for LWC and PSA measurements. Scaling constant for the channels were to be determined in this facility. The fog/wind tunnel at ECN, Petten, The Netherlands was judged the most suitable facility for this effort. (2) Expose the PVM-100A to high wind speeds similar to those expected on research aircraft, and test the anti-icing heaters on the PVM-100A under typical icing conditions expected in atmospheric clouds. The high-speed icing tunnel at NRC, Ottawa, Canada was to be utilized. (3) Operate the PVM-100A on an aircraft during cloud penetrations to determine its stability and practicality for such measurements. The C-131A aircraft of the University of Washington was the aircraft of opportunity for these-tests, which were to be conducted during the 4-week Atlantic Stratocumulus Transition Experiment (ASTEX) in June of 1992. APPLICABILITY OF DIGITAL TERRAIN ANALYSES TO WIND ENERGY PROSPECTING AND SITING
L. L. Wendell, G. L. Gower, M. B. Birn, and C. C. Castellano Jul. 1993 8 p Presented at the Windpower 1993 Conference, San Francisco, CA, 12-16 Jul. 1993
(Contract DE-AC06-76RL-01830)
(DE94-004363; PNL-SA-22117; CONF-930726-6) Avail: CASI HC A02/MF A01

The recent publication of the Digital Elevation Model (DEM) database by the U.S. Geological Survey (USGS) has provided a unique opportunity for the development of cost-effective wind energy prospecting technology. This database contains terrain elevation values on a Latitude-Longitude grid with a resolution of 3 arc-seconds (about 90 m) for the contiguous United States, Hawaii, and Puerto Rico. This database has been coupled with software that will produce shaded-relief maps on a laser printer in a format compatible with the state wind power maps in the U.S. wind energy atlas. By providing a much higher resolution of the terrain features than was possible when the U.S. atlas was prepared, these maps can be useful in general wind prospecting activities. As highly resolved as the 90-m DEM data seem to be when compared to the atlas grid, they still appear to be too coarse to resolve terrain features in the detail required for local wind flow characterization and wind plant layout. Gridded terrain data at about 10-m resolution are available from the USGS for some areas of the United States. In areas where these data are unavailable, they may be generated by digitizing and gridding the contours from a 1:24,000-scale USGS map over the area of interest. Comparisons of terrain profiles from cross sections of the 10-m and 90-m data provide an indication of the effect of resolution on the reliability of terrain feature representation. Oblique views of the terrain in shaded-relief format provide a dramatic enhancement of the shape and relative position of features of interest. DOE

SPATIAL INTERPOLATION, NETWORK BIAS, AND TERRESTRIAL AIR TEMPERATURE VARIABILITY Ph.D. Thesis
Scott Michael Robeson 1992 103 p
Avail: Univ. Microfilms Order No. DA9319059

Variations in air temperature have profound impacts on our planetary

environment. Estimating air temperature variability, therefore, is of considerable importance not only for environmental analyses, but for assessing social and economic impacts as well. Although a variety of approaches (e.g., mathematical modeling, analysis of satellite and paleoclimatic data) are used to analyze air temperature variability, estimates made from observational station networks still are considered the most reliable. Estimates of air temperature change made from station data, nonetheless, are subject to several types of error. While observational errors have been identified at station locations, errors related to using sparse and highly irregular spatial and temporal distributions of stations (i.e., network bias) have not been assessed adequately. Since irregularly spaced data usually are interpolated to obtain a terrestrial average, methods of spatial analysis clearly play a role in determining estimates of air temperature change. Through graphical and statistical analysis, several spherically-based interpolation methods - inverse distance-weighting, triangular surface patches, and smoothing by functional minimization - are evaluated and compared. Analysis of spatial interpolation errors also provides information about the strengths and weaknesses of the station network. Cross validation and other resampling methods are used to evaluate interpolation methods and the station network for both air temperature anomalies and raw air temperatures. Cross validation analysis of air temperature anomalies suggests that errors are nontrivial and, for some years, interpolation error may be as large as estimates of temperature trends over the last century. Resampling from the station network also suggests substantial network induced variability in estimates of global change. By removing spatial variability, reducing air temperatures to anomalies from a station mean does reduce interpolation error relative to raw air temperatures. At the same time, however, valuable information needed for physically based studies (e.g., radiative emission, phase changes of water, etc.) is removed. To obtain reliable air temperature space-time series, information from a high-resolution climatology is incorporated to reduce interpolation error. Dissert. Abstr.

ATMOSPHERIC MOISTURE FIELDS DERIVED BY SATELLITE OBSERVATIONS OVER THE TROPICAL PACIFIC OCEAN Ph.D. Thesis
Hyosang Chung 1993 182 p
Avail: Univ. Microfilms Order No. DA9328703

Values of precipitable water are retrieved over the tropical and subtropical Pacific Ocean from TOVS infrared and microwave channel brightness temperature and OLR observations by means of stepwise linear regression. The most useful temperature and moisture sensing channels are pre-selected from sensitivity tests of a radiative transfer model. Numerous models are developed and tested against collocated radiosonde observations and Nimbus-7 SMMR precipitable water estimates. For RAOB comparisons, the best estimator used 15 TOVS predictors and captured 71.1 percent of the variance (+/- 0.62 g cm(exp -2) standard error) for column precipitable water; for precipitable water of 700-500 mb bulk layer, these values were 71.7 percent and +/- 0.17 g cm(exp -2). Little skill of estimated precipitable water was obtained for moisture above 500 mb. Regressions were less skillful against SMMR, unless collocation parameters were tightly controlled; SMMR was less acceptable than RAOB's because of observational drift and errors. Generally, the most skillful predictors were boundary layer brightness temperatures of TOVS channels and satellite estimated stability indices. 'Moisture channels' were hardly useful except for estimating middle and upper tropospheric moisture. Additional regression models were constructed testing the sensitivity to different observational and meteorological characteristics. Models which used some in situ observations, surface observations or stabilities calculated from RAOB, were the most successful. The best of these explained 87.5 percent of the variance, but the regression selected almost no TOVS channels, relying instead on conventional RAOB and surface observations. A set of four regression models were developed, stratifying atmospheric characteristics on the basis of collocated OLR values. These models improved the variance explained by 5.0 percent; the model associated with the highest OLR values (275 W m(exp -2) less than or equal to OLR; that is, no cloud) showed only marginal skill. Precipitable water fields were generated from the best TOVS-only model for seven days in January 1983 and compared with SMMR-estimated fields, OLR fields and ECMWF precipitable water analysis. The TVOS regression model compared favorably to the SMMR analysis in amplitudes and features. It revealed more evolving synoptic signal than the ECMWF analysis. In synoptically active regions, it differed with respect to the OLR analysis, primarily because of actual differences in the vertical distribution of water vapor. Dissert. Abstr.

MODELING STUDIES OF FRONTOGENESIS IN THE UPPER AND MIDDLE TROPOSPHERE Ph.D. Thesis
Celal Sukru Konor 1992 280 p
Avail: Univ. Microfilms Order No. DA9317496

This research addresses fundamental questions associated with upper-level frontogenesis during the evolution of a mid-latitude disturbance in the framework of three-dimensional primitive-equation model simulations on a beta-plane. Simulations are performed by using two different models based on pressure and isentropic vertical coordinates starting with similar initial conditions in a nearly adiabatic atmosphere. The performance of the models is evaluated by using different spatial resolutions for various initial conditions to select the most realistic upper-level frontogenesis simulation. Dynamical processes involved in upper-level frontogenesis are analyzed separately in selected pressure and isentropic coordinate model simulations. Analyses reveal many similarities as well as differences in the process of simulated frontogenesis and tropopause folding with these models. The isentropic coordinate model produces stronger and very narrow upper-level fronts and deep tropopause foldings compared to the pressure coordinate model. Analyses suggest that this difference in the isentropic model simulation is a result of the existence of a positive-feedback mechanism suggested by Mudrick acting during the upper-level frontogenesis. With this feedback, as isentropic surfaces are tilted vertically in the upper-level fronts to enhance the horizontal temperature gradients, stratospheric air with high potential vorticity penetrates into the troposphere. Local increases in the static stability enhances vertical tilting further which leads to very local and narrow frontal developments. Difficulties resulting from intersection of isentropic surfaces with lower boundary with isentropic coordinate model remain unsolved. Consequently, near the lower boundary, potential vorticity and temperature fields are unrealistic. Therefore, combining isentropic coordinate with a sigma-coordinate, which follows the terrain, appears very attractive. However, there are many technical difficulties associated with such a general coordinate system. In this study, a method to design such a hybrid coordinate system is discussed in detail. Dissert. Abstr.

ATMOSPHERIC TURBULENCE WITHIN AND ABOVE A CONIFEROUS FOREST Ph.D. Thesis
Xuhui Lee 1992 214 p
(ISBN-0-315-75468-0) Avail: Univ. Microfilms Order No. DANN75468

An experiment to study the exchange processes within and above an extensive coniferous forest of Douglas fir trees was conducted on Vancouver Island during a two-week rainless period in July and August 1990. The stand, which was planted in 1962, thinned and pruned uniformly in 1988, had a (projected) leaf area index of 5.4 and a height of h = 16.7 m. The experimental site was located on a 5 degree gentle slope. The primary instrumentation included two eddy correlation units which were operated in the daytime to measure the fluctuations in the three velocity components, air temperature and water vapor density. One unit was mounted permanently at a height of 23.0 m (z/h = 1.38) and the other at various heights of (z/h) 2.0 (0.12), 7.0 (0.42), 10.0 (0.60), and 16.7 m (1.00) with three 8-hour periods of measurement at each level. Profiles of wind speed and air temperature were measured continuously during the experimental period at heights of 0.9, 2.0, 4.6, 7.0, 10.0, 12.7, 16.7 and 23.0 m using sensitive cup anemometers and fine wire thermocouples, respectively. Radiation regimes and air humidity were measured both above and beneath the overstory of the stand. The vertical structure of the stand affected, to a great extent, the vertical distributions of the velocity statistics (wind speed, variance, turbulence intensity, Reynolds stress, skewness, and kurtosis), air temperature, sensible and latent heat fluxes. The effect was also evident in the quadrant representation of the fluxes of momentum, sensible heat and water vapor. Negative Reynolds stress persistently occurred at the lower heights of the stand (z/h = 0.12 and 0.42). The negative values were related to the local wind speed gradients and it is believed that the longitudinal pressure gradient due to land-sea/upslope-downslope circulations was the main factor responsible for the upward transport of the momentum at these heights. Energy budget was examined both above and beneath the overstory of the stand. The sum of sensible and latent

heat fluxes above the stand accounted for, on average, 83 percent of the available energy flux. Beneath the overstory, the corresponding figure was 74 percent. On some days, energy budget closure was far better than on others. Counter-gradient flux of sensible heat constantly occurred at the canopy base (z/h = 0.42), invalidating the conventional gradient-diffusion relationship of K-theory at this height. Near the forest floor, however, K-theory with a far-field eddy diffusivity appeared to work satisfactorily. The daytime profiles of the dimensionless potential temperature Delta(theta)/theta(sub x), where the characteristic temperature, theta(sub x), was defined as the ratio of the kinematic sensible heat flux to the square root of the vertical velocity variance both measured above the stand (z/h = 1.38), were found to be well stratified by H(sub g)/H(sub T), the ratio of the sensible heat flux measured near the forest floor (z/h = 0.12) to that measured above the stand (z/h = 1.38). The profile of Delta(theta)/theta(sub x) was simulated by combining the random flight technique for the dispersion of sensible heat from the elevated canopy source and the gradient-diffusion model with a far-field diffusivity for the dispersion from the ground-level source. The simulated profile agreed reasonably well with the measured one. The simulation results suggested that the profile of Delta(theta)/theta(sub x) was not sensitive to the shape of the wind speed profile. Dissert. Abstr.

MULTIPLE WEATHER REGIMES AND BAROCLINICALLY FORCED SPHERICAL RESONANCE
Shuting Yang 22 Oct. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0349-0467)
(DM-65; ETN-94-95954) Avail: CASI HC A03

Systematically recurrent, geographically fixed weather regimes forced by a single isolated mountain in a two layer, high resolution, quasi geostrophic model modified for the sphere are found to be robust phenomena. While the climatological stationary wave is often confined to the region just downstream of the orography, giving the appearance of a wave train propagating into the tropics, the regional maximum center of low frequency variance appears around the hemisphere, giving the appearance of zonal resonance or some type of zonally confined propagation. This result is not anticipated in light of Rossby wave dispersion theory on the sphere. On the other hand, baroclinic disturbances developing on a meridional temperature gradient of finite extent force subtropical and polar easterlies as well as a sharpened midlatitude westerly jet, which provide a powerful zonal waveguide (by refraction and/or reflection) for the Rossby waves. These conditions are favorable for the establishment of multiple weather regimes. The baroclinicity of the atmosphere is then continuously forcing a mean state which favors forced zonal propagation counteracting the meridional dispersion generated by the spherical geometry alone. OBJECTIVE ANALYSIS OF A COASTAL OCEAN EDDY USING SATELLITE AVHRR AND IN SITU HYDROGRAPHIC DATA M.S. Thesis
Rogerio P. Chumbinho 23 Sep. 1993 51 p
(AD-A275715) Avail: CASI HC A04/MF A01

A common characteristic of the interaction between the coastal topography and eastern boundary currents (EBC) is the appearance of cold filaments and mesoscale eddies. Hydrographic and satellite temperature data obtained during a cruise on board R/V Point Sur off Point Arena, California, in May 1993, were analyzed to study a particular eddy field in this area. The hydrographic data was first used to verify the remotely sensed surface temperature field, using three dimensional data visualization. Selected vertical levels from each hydrographic station were then interpolated into a broader, finer resolution grid domain in preparation for an eventual model initialization, using multiquadric interpolation. The results verify the existence of the eddy and show its signature in the vertical to about 300 meters depth. A sensitivity study of interpolation parameters was performed to evaluate approximately the optimal set of parameters, showing that the multiquadric interpolation resolves very well the temperature field in the upper levels and introduces small amplitude, small scale noise in the deeper levels. This noise can be eliminated by a more thorough parameter sensitivity study. DTIC

THE VELOCITY FIELD IN THE NORTHEAST ATLANTIC FROM SATELLITE-TRACKED DRIFTING BUOYS M.S. Thesis
Paolo Giannetti Sep. 1993 82 p
(AD-A275704) Avail: CASI HC A05/MF A01

Data from 36 surface drifters (Holey Socks) were collected for a period of 23 months from July 1991 to May 1993 in the Northeast Atlantic Ocean between the Azores Islands and the Canary Islands as a part of the SUBDUCTION experiment. The position information from those drifters is analyzed in this study to obtain horizontal velocity statistics at the drogue level (15m). Mean currents in the area are found to be less than 2 cm/sec except in the vicinity of the Azores Front where the 2-year mean eastward currents measure 3.9+/-1.7 cm/sec. Zonally-averaged northward currents are divergent over most of the area in contrast to the convergent surface currents expected in the region due to convergence of the climatological Ekman transport. It is shown, however, that array bias due to the nonuniform distribution of particles in the presence of an eddy field can account for this result. The mean eddy kinetic energy level is 103/sq cm/sq sec and the mean diffusivity is 5.0 x 10(exp 7)/sq cm/sec. These values are in line with results from previous drifter studies. Mean Lagrangian integral time and length scales are 5.7 days and 48 km, respectively and, in all cases, east-west scales are greater than north-south scales. In general, this long data set is still dominated by the effects of mesoscale eddies. An objective method to select eddy portions of drifter trajectories is presented that may help to characterize the eddy field in future studies. DTIC

GLOBAL ACOUSTIC MAPPING OF OCEAN TEMPERATURES (GAMOT) Quarterly Progress Report, Oct. - Dec. 1993
Dec. 1993 63 p
(Contract MDA972-93-1-0004)
(AD-A275777) Avail: CASI HC A04/MF A01

Work performed on global acoustic mapping of ocean temperatures (GAMOT) tasks is described. Task A involves the acoustic thermometry data taken in 1987 along fifteen basin scale sections in the northeast Pacific, the development of a signal processing package for the surface suspended acoustic receiver (SSAR), and the computation of travel times of rays through ocean models of the Pacific. Task B involves simulation of the northeast Pacific Ocean for 1961-1991 driven by equatorial Kelvin waves and real winds. Task C covers development of the SSAR. Task D

describes the procurement of a 70 Hz source which can be moored autonomously. CASI

(AD-A275321) Avail: CASI HC A07/MF A02

During the three project years, empirical studies of scale relationships in the retrieval of sea ice lead statistics have been undertaken, as have modeling investigations of atmospheric influences on the satellite signal. Additionally, we have developed statistical models that describe the scaling properties of leads. The empirical studies have been based primarily on comparisons within and between Landsat and AVHRR imagery, while the atmospheric models have been specific to the AVHRR. Submarine sonar data have been used in the statistical model development. Specific accomplishments include: atmospheric temperature and humidity profiles for the Arctic have been constructed from Soviet ice island data and were used in the construction of three-season imagery, and nearest-neighbor resampling has been shown to be the most effective in maintaining the spectral characteristics of leads while spatial interpolation (e.g., bilinear) retains their spatial structure; empirical relationship between pixel size and lead width have been determined; procedures for the retrieval of lead statistics have been developed and applied to Landsat and ERS-1 SAR data; and the relationship between 'apparent' lead widths measured along a transect. A MODEL ANALYSIS OF POTENTIAL VORTICITY ON ISOPYCNAL SURFACES FOR THE GLOBAL OCEAN M.S. Thesis
Douglas C. Marble Sep. 1993 81 p
(AD-A275047) Avail: CASI HC A05/MF A01

Charts of potential vorticity (q) within four different density layers, calculated from an eddy resolving global ocean general circulation model, are presented for the Atlantic, Pacific, and Indian Ocean Basins. Potential Vorticity is evaluated as q = (f/p)(delta(sigma)/delta(z)), a formulation that is valid for large, slow scales and allows it to be readily calculated from model output. Here, f is Coriolis, p in situ density, sigma the potential density referred to the sea surface, and z the vertical coordinate. The model is shown to represent oceanic density structure with reasonable accuracy. The most significant departure from observations are the steep density gradients on the northern boundary of the Antarctic Circumpolar Current. This may be due to model convective adjustment parameterizations and the extent of the smoothing in the cataloged data, which may be greater in the southern oceans due to relatively scarce observations. Model derived values of potential vorticity correspond well with those calculated from observations. In the middle and lower layers, the three basins tend toward homogenization, representing unventilated layers. Gyres of q in the upper layers of the northern Atlantic and Pacific Oceans, with their northern boundaries anchored in the outcrop region, illustrate the ventilation of these layers. DTIC

SEAFLOOR CHARACTERIZATION USING TEXTURE Final Report
Suresh Subramaniam, Herb Barad, Andrew B. Martinez, and Brian S. Bourgeois 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275399; NRL/PP/7441-93-0013) Avail: CASI HC A02

Texture analysis is performed on multibeam sonar imagery. A set of fourteen texture features is computed using co-occurrence matrices to form the feature space. The dimensionality of the feature space is reduced by extracting the principal components from the original feature space. Classification of the image is performed on the principal components using K-Means algorithm. Results indicate that seafloor bottom types can be characterized by analyzing the texture of the bathymetric sonar images. DTIC

TIDAL ATLAS SOFTWARE DEVELOPMENT Final Report
Y. L. Hsu, Juan F. Reynaud, and Ernst W. Schwiderski 7 Dec. 1993 50 p
(AD-A275251; NRL/MR/7442-93-7060) Avail: CASI HC A03/MF A01

Tidal atlas software has been developed for naval hydrographic survey operations. The software displays an integrated database of tides, bathymetry, and coastlines. It is a menu-driven PC/WINDOWS program. The tidal databases include the tidal constituent bank from the International Hydrographic Organization and Schwiderski's global tidal data. The bathymetry uses the 5-minute ETOPO5 database and the coastlines use the world vector shoreline database. The software can display tidal stations and tidal constituents for a user-specified area. The software also provides other functions including tidal height plot, tidal zone plot, cotidal, and corange plots. DTIC

SAR-RELATED STRESS VARIABILITY IN THE MARINE ATMOSPHERIC BOUNDARY LAYER (MABL) Report, 1 Oct. 1992 - 30 Sep. 1993
Hampton N. Shirer and George S. Young 30 Sep. 1993 9 p
(Contract N00014-90-J-4012)
(AD-A275275) Avail: CASI HC A02/MF A01

By variably stressing the sea surface, secondary circulations within the marine atmospheric boundary layer (MABL) can modulate the sea-surface wave field and so can produce discernible signatures on SAR images of the ocean. Indeed, at the Fall '93 ARI workshop, Robert Beal showed ERS-I images illustrating the ubiquity of these signatures during the second HIGH-RES cruise in June 1993. Among the resulting signatures, the quasi-linear and cellular microscale patterns still require adequate explanation. The ubiquitous MABL two- and three-dimensional convective circulations provide promising candidates for the forcing phenomena producing these signatures. These microscale circulations have horizontal wavelengths on the order of one to ten times the boundary layer depth, or approximately one to ten km, and temporal scales on the order of one to ten hours. Thus, they produce stress variations on the spatial and temporal scales of the quasi-linear and cellular SAR signatures. Similarly the frequent occurrence of two-dimensional mesoscale atmospheric circulations in response to the SST gradient along the northwest wall of the Gulf Stream adds an atmospheric component to Gulf Stream signatures on SAR images on cross-stream scales of 1 to 50 km. Toshitsugu Sako, Shin Kisugi, Tsune Kusakawa, Yoshiharu Kon, Hideaki Nakada, Hitoshi Nishimura, Norihisa Yokouchi, Hiizu Isa, Hisashi Soma, and Norihiko Kaneko et al Mar. 1993 149 p In JAPANESE
(JTN-94-80587) Avail: CASI HC A07/MF A02

Technologies required for ocean development were explored by conducting case studies at two model sites: at a spacious site with much reserved nature which can be utilized for development, and at a close, densely populated site with shallow depth of water, requiring much environmental improvement before development. After investigation of characteristics of each site, development conception and plans were set

up conforming to the characteristics of the sites. Then ocean technologies to realize the plans were selected by evaluating technical, sociological and environmental factors. Based on the evaluation results, important technologies for future coast development were reviewed, and eleven were selected as science and technology fields for future research and development. In 1990 and 1991, development of coast/ocean was studied focusing on the three items: (1) 'waterfront' project was investigated as a measure for densely populated areas; (2) ecology along the shallow coasts was evaluated to study influences to ecological environments; and (3) the possibility of adopting 'mitigation', an environmental compensation, was reviewed. MODELING DEEP EQUATORIAL CIRCULATION Ph.D. Thesis
Dailin Wang 1993 176 p
Avail: Univ. Microfilms Order No. DA9325058

Observations show that there are significant zonal currents near the equator below the thermocline, the so called equatorial deep jets. The dynamics of these currents are unknown. In this study, the origin of the equatorial deep jets is explored through a series of numerical experiments. High resolution thermohaline spin up experiments were undertaken to investigate the thermohaline hypothesis of equatorial deep jets. It is found that the deep circulation strongly depends on the deep stratification. If this is unrealistically weak, an alternating jet structure and strong deep upwelling near the equator can be generated. This strong upwelling can result in an extra meridional overturning cell near the equator in the meridional mass transport stream function. The lack of stratification in the deep ocean is a generic deficiency of large scale circulation models which employ insulating bottom boundary conditions. The deep stratification can be improved greatly by using a Newtonian bottom boundary condition for temperature. The resulting stream function is more realistic and the deep equatorial overturning cell and alternating jets disappeared. It is the bottom boundary condition rather than the size of the vertical diffusion coefficient that is more important in determining the deep stratification and deep equatorial flow. Even though we cannot completely rule out the thermohaline forcing hypothesis of the equatorial deep jets (because thermohaline spinup experiments with very low explicit diffusion have not been carried out to investigate the dynamics of thermohaline circulation in a low diffusive regime), it is improbable that the deep jets are purely thermohaline in origin. High resolution, low diffusion wind-forced equatorial models were next run to investigate whether subthermocline mean equatorial currents can be generated via instabilities of the surface currents and wave-wave interactions. It is found that if eddy diffusion coefficients for momentum and heat are low enough, there are significant subthermocline time-mean currents. These currents are connected to low latitude western and eastern boundary subsurface currents. The eddy processes (Reynolds stress divergence) are found to be as important as the parameterized subgrid processes (explicit diffusion). Dissert. Abstr.

ON THE NONLINEAR DYNAMICS OF OCEAN WAVE SYSTEMS Ph.D. Thesis
Jiyue J. Li 1992 204 p
Avail: Univ. Microfilms Order No. DA9317181

The thesis is composed of three subjects, independent yet interrelated. The first part deals with the surface wave breaking problem, in which a mechanism of wave-breaking through intrinsic hydrodynamic instability is discovered. The second part is a general theory for nonlinear evolution of three-dimensional resonant wide-band wave systems. In part three, dynamics of nonlinear wave systems is generalized for non-conservative systems, and applied to model energetic ocean wave systems by taking the real effects into account of wind and dissipation due to nonlinear breaking and large scale diffusion at sea. In Part I, a physical picture, how waves deform and break, is presented by employing energy approaches, where both inter- and intra-wave interactions within the wide-band wave system are distinguished, and corresponding energy transfer through inter- and intra-wave interactions is demonstrated. It is shown that the result of inter-wave interaction is directly related to the instability of the Benjamin-Feir type; and the consequence of intra-wave interaction is principally responsible for the asymmetric deformation of a wave profile which leads to wave-breaking. In Part II, a general theory by a united approach is schematized for any resonant or near-resonant three-dimensional side-band multi-wave systems. A set of parabolic evolution equations is derived for the case n = 2, which includes the Benjamin-Feir system as a special case. Based on the new evolution equations, analytic results are developed for instability and temporal evolution of the system; also a global picture of its dynamics and bifurcation in a phase space is provided. Finally, bifurcation of planar wave solutions into 3-d non-interactive solutions of permanent form is studied. In Part III, modeling of energetic ocean wind-waves as a dynamical system is developed, in the light of the Kahma's wind-wave growth formulation relevant to the most energetic part in the Kitaigorodskii-Toba spectrum, and Toba's observational law. Based on the resulting equation of complex Ginzburg-Landau type, combined effects of pumping and damping on the modulational instability and temporal evolution of the side-band system are investigated. It is shown, over certain ranges of the parameters, that the asymptotic wave solutions could be either (1) a stable limiting cycle or (2) a pair of equilibria, or (3) a new discovered complex attractor in the phase space; they correspond respectively to (1) periodic, (2) stationary, or (3) chaotic modulation of waves in physical space. The results suggest that wind forcing and dissipation play a key role in contributing to the observed stochastic nature of wind-waves at sea. Finally, we discuss the formation of solitary wind-wave groups and their stability, and the theory is in good agreement with ocean observations of energetic wave groups. In addition, existence of ocean wave envelope front solutions is also discussed. Dissert. Abstr.

THE VALIDATION OF OCEAN SURFACE HEAT FLUXES IN AMIP
P. J. Gleckler and D. A. Randall Sep. 1993 6 p Presented at the 74th American Meteorological Society Annual Meeting, Nashville, TN, 23-28 Jan. 1994
(Contract W-7405-eng-48)
(DE94-001539; UCRL-JC-114684; CONF-940115-5) Avail: CASI HC A02/MF A01

Recent intercomparisons of Atmospheric General Circulation Models (AGCM's) constrained with sea-surface temperatures have shown that while there are substantial differences among various models (with each other and available observations), overall the differences between them have been decreasing. The primary goal of AMIP is to enable a systematic intercomparison and validation of state-of-the-art AGCM's by supporting in-depth diagnosis of and interpretation of the model results. Official AMIP simulations are 10 years long, using monthly mean Sea-Surface Temperatures (SST's) and sea ice conditions which are representative of the 1979-1988 decade. Some model properties are also dictated by the design of AMIP such as the solar constant, the atmospheric CO2 concentration, and the approximate horizontal resolution. In this paper, some of the preliminary results of AMIP Subproject No. 5 will be summarized. The focus will be on the intercomparison and validation of ocean surface heat fluxes of the AMIP simulations available thus far. DOE

Extreme temperatures, both hot and cold, can severely restrict the ability of aircrew and support personnel to accomplish their missions. Under emergency conditions of bail-out, ejection, and ditching of fixed or rotary-wing aircraft on land or in water, the survival rate of aircrew and passengers is also affected by the intensity of thermal stress experienced and the duration of exposure to the thermal stress. This has all recently been borne out by the experience of intense air operations in the Gulf War. This symposium reviewed the operational conditions experienced under extreme hot and cold weather. The papers presented at this symposium highlighted recent advances in thermal physiology, clothing sciences, personal flying equipment, and microclimate cooling. Emphasis was placed on the potential applications of these advances in situations where thermal stress may confound the efficient achievement of mission objectives. For individual titles, see N94-28421 through N94-28453.

Eight subjects were exposed to three different combinations of air temperature and wind speed for two hours in a climatic chamber. Changes in core temperature, surface temperatures and heat flux, and metabolic rate were recorded during the exposure. The results obtained were compared with the predictions derived from a sophisticated computer model of human thermoregulation and heat exchange. Conclusions about the factors responsible for the rate of body cooling in air and the causes of the wide range of variability observed are discussed. The problems of predicting survival times on land for a diverse population are considered, and possible solutions are suggested.

Military cold survival research has traditionally concentrated on ways of conserving body heat. In contrast, this paper will describe recent investigations of metabolic heat production during cold exposure. In humans, increased heat production in the cold is achieved by increased shivering, i.e. involuntary intermittent skeletal muscle contractions, which must be fuelled. This research has focused on the thermoregulatory effects of manipulating the availability of specific fuel substrates to the shivering musculature. Using procedures such as muscle biopsies to quantify intramuscular substrate utilization, venous blood sampling to quantify circulating substrates, and continuous monitoring of metabolic rates and rectal temperatures during cold exposure, the importance of skeletal muscle carbohydrates stores has been demonstrated for the ability to maintain heat production and delay the onset of hypothermia during cold water immersions. Acute reductions in muscle carbohydrate stores were associated with significant reductions in heat production by the body during shivering, and a more rapid decrease in rectal temperature. In contrast, another series of studies induced acute reductions in circulating fat stores, but there was no effect on body temperature regulation. The availability of sufficient carbohydrate stores to the shivering musculature seems to be critical for the body's ability to delay hypothermia during acute cold stress.

It is well established that humans have a poor resistance to cold. Once the insulation provided by the microclimate and by peripheral vasoconstriction has been maximized, the last line of defense against the cold resides in an increase in metabolic heat production (M-dot). Several techniques have been used to further enhance M-dot in the cold, but it is a pharmacological approach that has received the most support. To that effect, recent experiments in cold-exposed subjects have shown that the ingestion of ephedrine (E; a decongestant) and caffeine (C; a methylxanthine) improves M-dot, heat debt (body heat deficit), and the drop in body core (rectal) temperature T(sub re), (P less than 0.05). The ingestion of an E, C, and theophylline (T; a bronchodilator) capsule produced about the same beneficial effect (P less than 0.05). Although some authors have reported that T alone reduces the drop in T(sub re) (i.e. warmer T(sub re)), these improvements require further clarification since M-dot and mean skin temperature T(sub sk)-bar practically did not change. A theobromine-based (another xanthine) Recreation and Sports bar (Cold Buster) is purported to reduce the drop in T(sub re) and thus delay the onset of hypothermia. However, such claims could not be confirmed in two different studies performed in our lab. Despite an increase in M-dot in some studies, C alone did not alter T(sub re) in the cold. It is concluded that ephedrine/xanthine mixtures represent at the moment, one of the best and safe pharmacological agents to enhance heat production and cold resistance.

Adequate nutrition and hydration can be crucial to the survival of downed aircrews. To determine the nutritional adequacy and palatability of an improved, all-purpose, all-environment survival packet (GP-I) compared to the old survival packet (GP), a field test was conducted using combat survival school students. During a five day survival exercise, 41 aircrew members ate the GP-I and 57 ate the GP. Nutrition/hydration status were assessed from food/fluid intake records as well as changes in body weight. Water turnover was measured in a subset of subjects (n=30) using deuterium oxide. Pre- and post-test hemoglobin, hematocrit, plasma osmolality, urine specific gravity (SG) and ketones were also measured. Acceptability of the two rations was evaluated. Subjects eating the GP-I consumed more calories; GP-I 774 +/- 436 versus GP 642 +/- 408 kcal/d. Carbohydrate and protein consumption were similar but the GP-I group ate significantly more fat, 35 +/- 21 versus 24 +/- 18 g/d. Mean fluid intake was similar for both groups (GP-I 4.3 +/- 1.7, GP 4.4 +/- 1.9 L/d). Sodium intakes were 1.1 g/d. Weight decreased significantly for the GP-I and GP groups (2.9 +/- 1.4, 3.4 +/- 1.7 kg, respectively); changes were similar between groups. Water turnover data indicated subjects maintained adequate hydration as did hemoglobin, hematocrit, and plasma osmolality. Mean post-test urine SG was 1.024 +/- 0.007 and moderate amounts of ketones were detected in urine. Both rations received favorable ratings, but the greater variety of the GP-I ration resulted in higher acceptability ratings. Either ration is adequate; however, the GP-I is more desirable and palatable than the GP.

The paper surveys briefly the role of textile materials in enhancing comfort and survival prospects, in both cold and hot climates, identifying the fiber, fabric and textile construction factors of critical importance. An examination of the interaction between these factors, showing how they enhance or interfere with one another, is also carried out in outline. Selected new textile fibers and fabric construction or finishing techniques are then analyzed to determine how their novel characteristics can improve their cold- or hot-weather performance, with a prediction in each case of how the advantages derived from their incorporation may potentially be of use in improving aircrew or ground support staff clothing applications.

Compared to closed cell foam, constant wear garments designed with this material provide added comfort due to increased heat losses during sweating, shortened drying times after sweating, and added flexibility. Although introducing water vapor permeability causes a degradation to the material's cold water immersion protection, the integrity of its fire protection and buoyancy remains unaltered.

In 1976 W. L. Gore & Associates, Inc. invented GORE-TEX fabric utilizing expanded polytetra-fluoroethylene (ePTFE). This was the first truly waterproof and moisture vapor permeable fabric laminate. In 1980 the company began to develop products for military applications. Since that time, Gore has supplied GORE-TEX fabric for, and assisted in the development of, some of the military's most technically sophisticated apparel: the U. S. Army's Extended Cold Weather Clothing System (ECWCS), the U. S. Navy's Over Water Flight Suit (OWFS), and the U. S. Air Force's Security Police Jacket being but a few examples. All of these garments provide the user with increased levels of protection from harsh environments and have proved themselves to be very durable. GORE-TEX fabric laminate has consistently proven itself to be technically superior to any other material. This paper details the development by Gore of a new chemical warfare protective material based on proven ePTFE technology combined with a new highly activated polymer system (APS). Author

The purpose of this research was to evaluate the relative effectiveness of different clothing systems in their contribution to protection against exposure to high heat flux flash fires. All systems were exposed to controlled simulated flash fires (80 or 84 kW/sq m) on a thermally instrumented mannequin. The percentage of the mannequin surface reaching second and third degree burn criteria was recorded. In addition, the multiple layers of fabrics which were used together in each of the garment systems were tested according to a standard thermal protective performance (TPP) test. The protection provided by multiple layered garment systems was significantly greater than would be expected from the additive effects of the layers used singly. The outer layer of a garment system must be flame retardant, however; wearing a flammable garment over a flame retardant one clearly negates the benefits of the FR layer. While it cannot be concluded for certain that undergarments must also be flame retardant, results demonstrate that FR undergarments offer more protection than non-FR ones, especially when worn under the relatively light-weight fabrics which may be used for military flightsuits. Only in one experiment with garment systems comprising all-FR layers did small-scale TPP tests indicate the relative protection provided by the systems. The TPP test did not indicate the potential hazard of systems in which the outer layer is non-FR. Nor did it differentiate among the three different flight suit fabrics or demonstrate the relative protective performance of different underwear materials. Author (revised)

Manual performance during work in cold and windy climates is severely hampered by decreased dexterity. In this study, the quantitative performance decrease is investigated as a function of climatic factors. The decrease in finger and hand dexterity and grip force was quantified for nine combinations of ambient temperature (-20, -10, and 0 C) and wind speeds (0.2, 4, and 8 ms(exp -1)), controlled in a climatic chamber. Finger dexterity was determined by the Purdue pegboard test, hand dexterity by the Minnesota manual dexterity test, and grip force by a hand dynamometer. Twelve subjects with average to low fat percentage were exposed to cold air for one hour with and without extra insulation by a parka. The subjects were clothed in standard work clothing of the Royal Netherlands Air Force for cold conditions. Extra insulation did affect cold sensation but not manual performance. The deterioration (in percent) in performance is strongly dependent upon Wind Chill Equivalent Temperature (C), and exposure time (min). In a computer program, the performance decreases and freezing risk is indicated for variable climatic conditions. Derived from text

During a night formation mission including an approach without establishing a connection to the tanker aircraft a collision of both aircrafts, Typ PA 200 Tornado occurred. The four aircrew members performed an ejection. The site of the accident is located over the baltic sea in the Skagerrak region. At the time of accident, the air temperature was noted with 6 C, the water temperature with 11 C, and the sea with waves of 4 to 4.5 m height with a frequency of 8 waves per minute. The time of rescue ranged from 1 hour 28 minutes to 2 hours 14 minutes. This document reports on clothing and personal equipment, on the clinical findings, and on statements of the crew members. The crew member who was recovered after 2 hours and 14 minutes did not survive. This accident shows that with the ordered clothing, a survival under these conditions is supported, yet with incomplete equipment, it must be reckoned with a fatal outcome. Further details are discussed. Derived from text

In this paper, the concept of an Advanced Integrated Survival System is introduced and discussed in relation to the Helicopter Crew Member and Passengers, although the principles are equally applicable to many other types of user and circumstances requiring specialized protective clothing. The fundamental principles behind the concept are firstly that the wearer should be given protection against all of the hazardous responses associated with immersion in cold water and secondly, that the individual components which make up the integrated survival system (ISS) must be compatible and complementary. They may also be interdependent. Derived from text

Thermoregulation is normally viewed as the physiological responses aimed towards keeping the deep body temperature constant and high. For

this work, this viewpoint is changed, and the human thermoregulation is viewed as those physiological mechanisms that keep the body at an optimal functional state. Here, the extremities and their thermal state is of the highest importance. In the extremities, the arteriovenous anastomoses (AVA's) determine the local temperatures, and by their action also define the thermoregulatory state of the body. The AVA's are centrally regulated, they determine the heat exchange with the environment, and they are the main determinants of the average skin temperature. By following their reactions, man's thermoregulatory state can be ascertained. In the treatment of hyperthermia and hypothermia, these functions are highly relevant. The role of the AVA's place them as a specific thermoregulatory organ responsible for the maintenance of optimal extremity temperatures.

Animals have two main methods of adjusting their body temperature. Poikilothermic animals adjust it to the existing ambient temperature, temperature, whereas homoiothermic animals keep temperature at a relatively constant value which is frequently above the ambient temperature; thus, temperature; thus, they able to stay in contrast to poikilothermic animals whose metabolic processes slow down increasingly due to van't Hoff's rule when ambient temperatures are when ambient temperatures are low, rendering sometimes even resulting in low-temperature rigidity. This, however, enables them to survive for a longer period of time in case of a lack of food and/or cold spells. Hibernating animals are something in between. In times of food shortage and in the period of cold weather, they reduce their metabolic processes and lower their body temperature. Without a doubt, man is part of the group of homoiothermic organisms. However, when having a closer look at homoiothermic organisms, it becomes obvious that their body temperature is only constant as far as the body core and the vital organs are concerned - there are fluctuations in the temperature of the extremities, i.e., the outer parts of the body, which are mainly induced by the environment. Consequently, the tissue of these regions of the body is subject to changes in temperature which may be considerable without resulting in permanent damage. Findings, mainly obtained from transplantation medicine, have shown that the organs of the body core need not be damaged irreversibly either, if their temperature is lowered for several hours - on the contrary, they can even be preserved this way for a limited period. The decrease of central body temperature by warmth withdrawal leads in most cases to pathological changes of signal devices as the energy metabolism. The central body temperature may be lowered to 28 to 26 C without irreversible disturbances of life functions occurring. Not earlier as below 26 C rectal temperature life sustaining becomes critical. With continued exposure to cold and missing therapy, hypothermia passes several phases. Below 26 C rectal temperature in a phase of paralysis death occurs with cardiac disturbances like cardiac oscillation and disorders of atrio-ventricular conduction. Findings on the corpses of persons dying by cold exposure are discussed. Findings of a crew member dying after ejection and immersion in cold water are demonstrated and weighted by means of differential diagnosis. Author (revised)

Hypothermia may occur with prolonged exposure to cold air or water. Recovery from hypothermia involves removing the individual from the cold environment and utilizing a rewarming strategy. Three major rewarming strategies include the following: passive rewarming, active external heating, and active internal heating. Controversy continues regarding the best rewarming procedure for use in the field. Author (revised)

A COMPARISON OF FOUR METHODS OF REWARMING INDIVIDUALS COOLED BY IMMERSION IN COLD WATER c52
C. J. Cahill, P. J. Balmi, and M. J. Tipton *In* AGARD, The Support of Air Operations under Extreme Hot and Cold Weather Conditions Oct. 1993 8 p (For primary document see N94-28420 08-51)
Copyright Avail: CASI HC A02/MF A03

It has been suggested that hypothermia individuals could be actively rewarmed in the field by immersion of only the extremities (hands and feet) in hot water. If successful this technique would have enormous potential in the pre-hospital and hospital care of the victims of accidental hypothermia. The theory is that local heat to the extremities results in opening of the arteriovenous anastomoses with return of warmed blood directly to the core, via the superficial veins bypassing the intervening cold peripheral tissues. A comparison of four techniques for rewarming subjects with lowered core temperatures has been undertaken. The techniques examined were: immersion to the neck in water at 40 C; immersion of one hand in water at 40 C; immersion of two hands plus forearms in water at 42 C; and passive rewarming. During rewarming, core and skin temperatures, heart rate, blood pressure, oxygen consumption, and peripheral blood flow were measured at frequent intervals. No significant difference, in the ability to raise the core temperature, was found among the techniques. It is concluded that hand rewarming, although theoretically attractive, does not work in practice and may even be detrimental in some circumstances, by suppressing intrinsic heat production. AEROMEDICAL SUPPORT FOR CASUALTIES IN EXTREMELY HOT CLIMATES c54
S. A. Nunneley and R. U. Bisson *In* AGARD, The Support of Air Operations under Extreme Hot and Cold Weather Conditions Oct. 1993 7 p (For primary document see N94-28420 08-51)
Copyright Avail: CASI HC A02/MF A03

Aeromedical support for operations in hot climates involves exposure to acute heat injury and chronic heat stress which are unfamiliar to many medical personnel in NATO nations. Preparation for deployment to a hot climate should include review of climatic data for the site, appropriate adjustment to supplies and equipment needed to handle predicted numbers of heat casualties, and education of all air base personnel regarding methods of preventing heat illness. Medical facilities at the remote site may include local buildings or air transportable units. Special care is required with respect to housekeeping and provision of safe food and water in hot climates. Casualties arriving from remote sites should be assumed to suffer from heat stress and dehydration; those with elevated temperatures or disturbed consciousness must be treated as heat stroke cases until proven otherwise. Oral rehydration mixtures should be used whenever possible, reserving intravenous fluids for severe cases. Plans for air evacuation of all patients should attempt to minimize heat stress during loading and allow for continued rehydration in flight. Author

Humans and animals often exhibit a remarkable ability to adapt to harsh or rapidly changing environmental conditions. One obvious means of adaptation is to move to where the environmental stresses are less severe. The body also has a great physiological capacity for adaptation. There

exists ample literature on adaptative mechanisms and processes. When a person becomes acclimatized, the hypothalamus and other body control organs and systems settle into cooperative equilibrium, with certain chemical or hormonal levels that are appropriate for that particular season. The present study, describes how simple dietary rules can prevent involuntary dehydration brought about by sweating. Author (revised)

A flight trial was conducted at RAF Akrotiri to assess the level of thermal strain associated with, and the G protection provided by, the prototype European Fighter Aircraft (EFA) interim aircrew equipment assembly (AEA) in a warm climate. Six subjects flew a standardized sortie four times in the RAF IAM Hawk aircraft: two while wearing the EFA AEA, and two wearing standard Hawk Summer AEA. The sortie profile included simulated air combat and four high G turns. Cockpit temperatures, rectal and skin temperatures, heart rate, and sweat rate were recorded. Subjective thermal comfort, fatigue, and G tolerance were also assessed. Skin temperatures at the chest, back, and upper thigh sites and mean skin temperatures were greater in flight, and sweat rate was increased when the EFA AEA was worn. However, rectal temperature and heart rate did not differ significantly when the EFA AEA was worn indicating that homeostasis was maintained by thermoregulatory mechanisms. Superior G protection was provided by the EFA AEA. Taken as 8 whole, these findings suggest that wearing the EFA AEA in a warm climate is associated with an increased but not unacceptable level of thermal stress while offering greater G protection. These results may not generalize to conditions where ambient temperatures are higher or where more insulative protective clothing is required. Author (revised)

The environmental symptoms questionnaire (ESQ) was developed to aid in the standardized assessment of symptoms experienced by individuals exposed to environmental extremes. It was used initially to delineate the symptoms of acute mountain sickness, but has since evolved into a more comprehensive tool for assessing subjective reactions to ambient heat and cold, to diet, physical exercise, and medications. The ESQ has also been made more reliable and user friendly by revision, addition and removal of certain items, and by compression of the initial scale values. Factor analysis of responses has identified several meaningful symptom clusters, and has provided a useful technique for scoring those clusters under both laboratory and field conditions. Studies utilizing the ESQ under various environmental extremes are summarized and reviewed. Current administration and scoring methods are presented. Author (revised)

EFFECTS OF THREE HYDRATION BEVERAGES ON EXERCISE PERFORMANCE DURING 60 HOURS OF SIMULATED DESERT EXPOSURE **c52**

L. G. Meyer, D. J. Horrigan, Jr., H. M. Neisler, and W. G. Lotz *In* AGARD, The Support of Air Operations under Extreme Hot and Cold Weather Conditions Oct. 1993 10 p (For primary document see N94-28420 08-51)

Copyright Avail: CASI HC A02/MF A03

Without adequate hydration, profound heat stress and dehydration can occur in military forces operating in hot environments. The purpose was to evaluate the effectiveness of three beverages on temperature regulation, cardiovascular response, and work performance during prolonged heat exposure. Nine male subjects, attired in standard military combat uniforms, lived in a climatic chamber for 3 days (60 h) in simulated desert conditions varying from 25 to 45 C, 20 percent relative humidity. Three submaximal treadmill exercise bouts (40 min at 4.8 km/h, 0 percent grade) were performed at 4-h intervals each day. Subjects randomly consumed three beverages: a water placebo of water, citric acid, and aspartame (WP); a 5 percent carbohydrate drink containing water, citric acid, sucrose, fructose, and electrolytes (CE); and a 4 percent carbohydrate drink containing water, citric acid, sucrose, glucose, electrolytes, pyruvate, and 1 percent glycerol (CEG). Subjects drank only one of the three beverages ad libitum during the 60 h but were encouraged to drink every 15 min during exercise. Each subject tested all three beverages in a double blind, repeated-measures experimental design. Sweat rate (SR), core (rectal) temperature (Tre), average skin temperature (Tsk), heart rate (HR), oxygen consumption (VO2), and subjective ratings of perceived exertion (RPE) were recorded during exercise. Body temperatures and metabolic parameters remained within expected physiologic limits during 60 h of simulated desert conditions. During exercise, RPE and HR were similar for all beverages, but VO2, Tre, Tsk, and SR differed among beverages. During the 3rd exercise session on all days, VO2 was higher for CE than CEG and WP; CEG tests had the lowest VO2 on the 2nd and 3rd days. Rectal temperature was lower with CE and CEG than with WP on the 2nd and 3rd exercise periods of each day. Skin temperatures were different during the second exercise period on all three days. Exercise sessions with CEG produced the highest SR. It was concluded that carbohydrate-electrolyte beverages, preferably with a small amount of glycerol, may provide beneficial physiological responses during exercise in hot-dry conditions during the first 24 h of exposure. However, water alone appears to provide adequate hydration for working in desert conditions over extended periods of time.

Thermal stress can be a serious problem for military personnel. This is largely because the measures employed to reduce such stress under normal working conditions are impractical under operational circumstances. For example, the specialized clothing worn by soldiers cannot generally be removed to reduce insulation and facilitate cooling. Similarly, operations are often conducted in hostile environments where ambient conditions, even inside vehicles, cannot be altered substantially. While reductions in work rate are feasible during peacetime, they have little place in combat as they compromise objectives and may still not be adequate to reduce thermal strain to acceptable levels. When operationally feasible, the provision of personal cooling can assist the body with heat dissipation and thermoregulation, often to the point that work can be continued at a near-normal rate with only slight to moderate thermal strain. An overview

of personal cooling technology studies conducted at DCIEM within the last decade is presented. It outlines the problems of thermal stress in operations and its effects on performance, examines various solutions to the problem, and summarizes the R&D efforts that culminated in the integration of personal cooling into the CH124 Sea King helicopters during Op Friction. This was to our knowledge the world's first use of air crew personal cooling garments during combat and it enabled the Canadian Forces (CF) to conduct their Sea King helicopter operations without being time-limited due to thermal physiological strain. The thermal stress in military aeronautics can involve a drop in physical and psychomotor performances; in particular the tolerance for accelerations is decreased. The use of a system of individual air-conditioning is likely to decrease the storage of heat and to thus allow the prolongation of missions. Two techniques are possible: a circulation of cooled fluid in contact with the body or a ventilation of cooled air inside the suit. Two systems were tested, one using a cooled water circulation, the other a circulation of air saturated with 20 C water vapor. The fluid, air, or water circulating in contact with the body is cooled using thermoelectric modules. The tests carried out on voluntary human subjects, in a hot environment going from 40 to 50 C, made it possible to highlight a clear improvement in thermal comfort. Each system has advantages and disadvantages. They must undergo technological improvements in order to allow their use on board combat aircraft. Author

The Gulf war created an unusual incentive to the rapid development and deployment of active cooling systems for defense personnel. One of the most successful efforts in this respect concerned a liquid-circulating system which departed from prior art in a number of significant ways. The system was deployed first by Canadian aircrew, and then by their British counterparts in the later stages of the conflict. The systems used by these forces are described, with an account of their physical and thermal characteristics, and an account of their performance in the field. Very recent developments in electrically powered cooling units for microclimate use are also described. These new devices offer very real advantages in terms of power and space consumption. The impact they will have on air operations in extreme heat is discussed. Author

Within the framework of the research and technology program, a whole-body protection suit with integrated helmet was developed by the Dornier Company. The thermophysiological capabilities of this suit were tested by Division IV Ergonomics of the German Air Force Institute of Aviation Medicine. Ambient temperatures higher than those normally to be expected in the cockpit were chosen intentionally. In spite of this fact, pulse rates remained below the limiting value and the average rise in core temperature was insignificant. Loss of weight through sweating amounted to approximately 1% of body weight. It proved possible to remove 82% of this sweat by means of ventilation. Based on the results of the questionnaires on subjective sensibility, no prejudice to well-being and no negative effects in respect of the capability to act were established with regard to the testing of the whole-body protection suit under laboratory conditions. The effects of microclimate cooling on aviator performance and physiology in Nuclear, Biological, and Chemical (NBC) Individual Protective Equipment (IPE) were evaluated in the USAARL UH-60 research flight simulator. Sixteen male aviators flew the simulator in two temperature conditions, 35 C and 41 C, both at 50% relative humidity (RH). Two thermoelectric conditioning units were used, one providing cooled blown air, the other cooled water to the aviators. At each temperature they flew for up to six hours in NBC IPE with no cooling, air cooling, and liquid cooling. Author (revised)

Highlights of the most significant research finding in the last few years are: (1) alpha/beta-type SASP have been shown in vitro to be a novel group of non-specific, double-strand DNA binding proteins which slow DNA depurination, block hydroxyl-radical cleavage of the backbone, and block UV induced pyrimidine dimer formation, while promoting spore photoproduct formation; (2) the effects of alpha/beta-type SASP in vitro are also exerted in vivo as these proteins are important factors in spore heat and hydrogen peroxide resistance, and the major cause of spore UV resistance; (3) studies of the regulation and processing of the SASP specific protease have strongly suggested that the processing of the zymogen form of this enzyme during sporulation is an autocatalyzed event triggered by changes in the forespore (very likely dehydration) which will block attack of the

active enzyme on SASP. In the first minutes of spore germination spore core rehydration then allows rapid SASP degradation. DTIC

In the work, several different detection systems based on 16S rRNA sequences were studied. The rRNA sequences were also used to infer phylogenetic relationships. The catalytic RNA from RNase P was studied as a potential alternative to rRNA sequences. Species-specific rDNA probes for Mycoplasma agalactiae, Mycoplasma bovis, Mycoplasma hyopneumoniae and Renibacterium salmoninarum were designed. The different probes were specific and could be used to identify their respective targets in clinical samples. It was observed that unexpected cross-hybridization of a probe to a non-target organism may depend on the type of mismatch. M. agalactiae is the closest relative to M. bovis, as was concluded from phylogenetic analysis. Group-specific rDNA probes for the detection of mycoplasma contaminated cell cultures was developed and tested on a large number of samples. NTIS

PLANT-MICROBE INTERACTIONS: PLANT HORMONE PRODUCTION BY PHYLLOPLANE FUNGI
T. Tuomi, J. Ilvesoksa, and H. Rosenqvist 23 Jun. 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-135563; ISBN-951-22-1671-X) Avail: CASI HC A03

The molds Botrytis cinerea, Cladosporium cladosporioides and the yeast Aureobasidium pullulans, isolated from the leaves of three short-rotation Salix clones, were found to produce indole-3-acetic acid (a growth promoter of plants). Abscisic acid (a growth inhibitor of plants) production was detected in B. cinerea. The contents of indole-3-acetic acid and abscisic acid in the leaves of the Salix clones and the amounts of fungal propagules in these leaves were also measured, in order to evaluate whether the amounts of plant growth regulators produced by the fungi would make a significant contribution to the hormonal quantities of the leaves. The content of abscisic acid, and to a lesser degree that of indole-3-acetic acid, showed a positive correlation with the frequency of infection by the hormone producing organisms. The amounts of hormone producing fungi on leaves that bore visible colonies were, however, not sufficiently high to support the argument that neither the fungal production of abscisic nor indole-3-acetic acid would to a significant degree contribute to the hormonal contents of the leaves of the Salix clones. The use of the API 20 NE system for the identification of Thermus was evaluated and compared with results obtained for conventional microbiological identification tests. Five Thermus strains were studied, including T. thermophilus DSM 579, T. flavus DSM 674 and three wild strains originating from hot springs in Iceland. The results for the API 20 NE system were in accord with conventional tests with reference to nitrate reduction, beta-galactosidase production, and the absence of indole and urease production. Furthermore, acid was not produced from glucose. Thus the API 20 NE kit provides a convenient tool for the characterization of Thermus strains, although gelatinase and aesculin hydrolysis must be verified using conventional methodology. NTIS

LEG MUSCLE VOLUME DURING 30-DAY 6-DEGREE HEAD-DOWN BED REST WITH ISOTONIC AND ISOKINETIC EXERCISE TRAINING
J. E. Greenleaf, P. L. Lee, S. Ellis, R. H. Selzer, and D. A. Ortendahl Mar. 1994 11 p
(RTOP 199-18-12-07)
(NASA-TM-4580; A-94054; NAS 1.15:4580) Avail: CASI HC A03/MF A01

Magnetic resonance imaging (MRI) was used to compare the effect of two modes of lower-extremity exercise training on the mass (volume) of posterior leg group (PLG) muscles (soleus, flexor hallucis longus, tibialis posterior, lateral and medial gastrocnemius, and flexor digitorum longus) on 19 men (ages 32-42 years) subjected to intense dynamic-isotonic (ITE, cycle ergometer, number of subjects (N) = 7), isokinetic (IKE, torque egrometer, N = 7), and no exercise (NOE, N = 5) training for 60 min/day during head-down bed rest (HDBR). Total volume of the PLG muscles decreased (p less than 0.05) similarly: ITE = 4.3 +/- SE 1.6%, IKE = 7.7 +/- 1.6%, and NOE = 6.3 +/- 0.8%; combined volume (N = 19) loss was 6.1 +/- 0.9%. Ranges of volume changes were 2.6% to -9.0% (ITE), -2.1% to -14.9% (IKE), and -3.4% to -8/1% (NOE). Correlation coefficients (r) of muscle volume versus thickness measured with ultrasonography were: ITE r + 0.79 (p less than 0.05), IKE r = 0.27 (not significant (NS)), and NOE r = 0.63 (NS). Leg-muscle volume and thickness were highly correlated (r = 0.79) when plasma volume was maintained during HDBR with ITE. Thus, neither intensive lower extremity ITE nor IKE training influence the normal non-exercised posterior leg muscle atrophy during HDBR. The relationship of muscle volume and thickness may depend on the mode of exercise training associated with the maintenance of plasma volume. Author

CELLULAR POLARITY AND INTERACTIONS IN PLANT GRAVIPERCEPTION Final Report, 1 Jun. 1991 - 17 Jun. 1993
Fred D. Sack 1993 4 p
(Grant NAG10-0085)
(NASA-CR-195261; NAS 1.26:195261; OSURF-724742) Avail: CASI HC A01/MF A01

Presented are results of studies on the mechanisms of gravitropic sensing in higher and lower plants. Gravitropic roots of the aquatic angiosperm, Limnobium, were found to have sedimented amyloplasts in their elongation zone but not in their rootcap; nuclei were found to sediment in the elongation zone as well. Another study attempted to understand how plastid sedimentation occurs in vertical Ceratodon cells and how this sedimentation is regulated. To determine whether the cytoskeleton restricts plastid sedimentation, the effects of amiprophos-methyl (APM) and cytochalasin (CD) on plastid position were qualified. Results suggest that microtubules restrict the sedimentation of plastids along the length of the cell and that microtubules are load-bearing for all the plastids in the apical cell, demonstrating the importance of the cytoskeleton in maintaining organelle position and cell organization against the force of gravity. Physcomitrella and Funaria were also studied. Results suggest that gravitropism may be relatively common in moss protonemata and reinforce the idea that amyloplast mass functions in gravitropic sensing. CASI

PHYSIOLOGICAL ANATOMICAL RODENT EXPERIMENT (PARE) .04 FEASIBILITY TEST 2
Hubert W. Burden 11 Apr. 1994 85 p
(Contract NCC2-810)
(NASA-CR-195210; NAS 1.26:195210) Avail: CASI HC A05/MF A01

The objective of this feasibility study was to subject pregnant rats of the same age, strain, and size that will be utilized in a shuttle flight experiment to all flight conditions except the unique microgravity of space flight and determine the feasibility of the proposed experimental design to meet the experimental objectives. The study utilized facilities at NASA, Ames Research Center, Moffett Field, CA to subject the rats to the gravitational stresses of a simulated shuttle launch and simulated shuttle landing. One hundred pregnant rats were received on gestation day (G) 2 (day 1 = day of vaginal sperm) and on G7, eighty rats were laparotomized to determine the condition of pregnancy and allow assignment to test

groups. The five test groups (N=10 each group) were as follows: Group 1, Nominal Flight; Group 2, Laparotomy Control; Group 3, Hysterectomy Control; Group 4, Vivarium Control; Group 5, Delayed Recovery. On G9, animals in groups 1,2,3, and 5 were subjected to a shuttle launch simulation. On G18, groups 1,2, and 3 were subjected to a shuttle landing simulation and on this same day groups 1 and 2 were subjected to unilateral hysterectomy to obtain fetuses and placentas for evaluation. Fetal crown-rump length and fetal weight of the Nominal Flight group was significantly less than the Laparotomy Control group, but placentas were similar. On G20, group 5 was subjected to a shuttle landing simulation and on this day this group received a unilateral hysterectomy and fetuses and placentas were weighed. Animals in all groups were allowed to go to term and all animals delivered between 06:00 hours G22 and 18:00 hours G23. After delivery, a blood sample was taken from each experimental dam, and they were euthanized and the thymus and adrenal glands weighed. The thymus weight from all experimental group dams was decreased relative to the Vivarium Control group but adrenal glands and hormone values in dam plasma was similar in all groups. Pups from experimental groups were tattooed for identification, the anogenital distance of male pups was measured, and all pups placed with foster dams and litter sizes were standardized to 10. There was no difference in anogenital distances between male pups from different test groups. Pups delivered from Delayed Recovery animals were smaller than pups delivered from Nominal Flight animals. On neonatal day 7, all pups were euthanized and pup adrenal glands and thymus weighed. There was no difference in weights of thymus and adrenal glands in pups euthanized at neonatal day 7. Collectively, these data confirm the feasibility of the experimental design to meet objectives of the studies proposed for shuttle flight. Author

ONE CARBON METABOLISM IN ANAEROBIC BACTERIA: REGULATION OF CARBON AND ELECTRON FLOW DURING ORGANIC ACID PRODUCTION
J. G. Zeikus and M. Jain 1993 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-FG02-87ER-13719)
(DE94-004852; DOE/ER-13719/5) Avail: CASI HC A02

The project deals with understanding the fundamental biochemical mechanisms that physiologically control and regulate carbon and electron flow in anaerobic chemosynthetic bacteria that couple metabolism of single carbon compounds and hydrogen to the production of organic acids (formic, acetic, butyric, and succinic) or methane. The authors compare the regulation of carbon dioxide and hydrogen metabolism by fermentation, enzyme, and electron carrier analysis using Butyribacterium methylotrophicum, Anaeroblospirillum succiniciproducens, Methanosarcina barkeri, and a newly isolated triculture composed of a syntrophic butyrate degrader strain IB, Methanosarcina mazei, and Methanobacterium formicicum as model systems. To understand the regulation of hydrogen metabolism during butyrate production or acetate degradation, hydrogenase activity in B. methylotrophicum or M. barkeri is measured in relation to growth substrate and pH; hydrogenase is purified and characterized to investigate number of hydrogenases and their localization and functions; and their sequences are determined. To understand the mechanism for catabolic CO2 fixation to succinate the PEP carboxykinase enzyme and gene of A. succiniciproducens are purified and characterized. Genetically engineered strains of Escherichia coli containing the phosphoenol pyruvate (PEP) carboxykinase gene are examined for their ability to produce succinate in high yield. To understand the mechanism of fatty acid degradation by syntrophic acetogens during mixed culture methanogenesis formate and hydrogen production are characterized by radio tracer studies. It is intended that these studies provide strategies to improve anaerobic fermentations used for the production of organic acids or methane and new basic understanding on catabolic CO2 fixation mechanisms and on the function of hydrogenase in anaerobic bacteria. ANNUAL REPORT AND SUMMARIES OF FY 1993 ACTIVITIES: DIVISION OF ENERGY BIOSCIENCES
Sep. 1993 140 p
(DE94-001723; DOE/ER-0602P) Avail: CASI HC A07/MF A02

The mission of the Energy Biosciences program is to generate fundamental information about plants and non-health related microorganisms that will constitute the base for new biotechnologies as well as supply information to improve usages of such organisms in their current form. The collective aims are totally consistent with the Department of Energy's objectives of developing alternate energy sources, replacements for otherwise fossil energy derived products and providing critical fundamental information for the preservation and restoration of environmental conditions affected by energy related activities. The EB program takes full advantage of its organizational locale in the Office of Basic Energy Sciences to directly interact with such disciplines as Materials Sciences, Chemistry, Engineering and Geosciences to promote cross-disciplinary research and planning activities. One of the major specific objectives of the EB program is to probe the enormous capabilities of the specified organisms to carry out biochemical conversions. The limitation to realization of entirely new products and processes via biotechnology is the lack of basic understanding of natural processes. Such knowledge will then afford the advantage of developing procedures to the benefit of people and their society in providing new products along with providing new employment possibilities. This document consists of abstracts of projects supported in FY 1993. DOE

The overall goal of this proposal is to clone low dose X-ray-induced genes via molecular biology cloning techniques. From previous data, certain human cells can clearly carry out adaptive survival responses (ASR's) following ionizing radiation. Research goals are to better understand how some human cells can establish ASR's, and why other cells fail to do so. The author has been successful at identifying several genes whose expressions are altered during the establishment of, and actual processes occurring in, the adaptive response of U1-Mel cells. He will, in the next year or so, investigate the kinetics of expression of these genes, and whether or not other environmental stresses affect the expressions of these genes via Northern blot analyses. Finally, he will begin to investigate the function(s) of these genes within the cell, either under normal conditions of growth or following X-irradiation, using antisense expression technologies. Antisense RNA analyses and DNA repair endpoints (i.e., survival recovery, alkaline/neutral filter elutions, and PFGE) will be combined to examine the effects of specific gene 'knock out' experiments on ASR's in those human cells which demonstrate this response. The author is constructing mammalian expression vectors containing cyclin A, cyclin B, p53, or xip5, and xip12 (when full-length cDNA's are available) in the 'sense' orientation to overexpress these genes in human cells which did not demonstrate ASR's, such as HTB-152 or a variety of other human fibroblasts. Since many of the xips identified by 2-D gel electrophoresis were cell cycle regulated, the factors turning them on or off within a normal cell cycle may be clearly related to the events occurring in human cells following a genetic insult. Avail: CASI HC A02/MF A01

Five healthy male climbers were investigated in a hypobaric simulator to elucidate the effect of hypobaric exposure on water-electrolyte metabolism and endocrine responses at rest and during exercise. After urination, the subjects drank water and rested for 30 minutes. Then blood and urine were taken and the simulator was decompressed to a simulated altitude of 6,000 m. They drank water again on arrival to 6,000 m, and blood and urine were taken after 30 minutes rest, and they conducted pedaling exercise. Heart Rate (HR) was monitored every 5 minutes during the exercise. After exercise, blood and urine were collected. Control experiment was done on another day by the same protocol at sea level. HR during exercise was about 120 beats/min at the simulated altitude, while the value at sea level was about 90 beats/min. A significant increase in blood cortisol and increasing tendencies in blood adrenocorticotropic hormone, aldosterone, etc. were observed after exercise at the simulated altitude, while blood atrial natriuretic peptide and urine volume did not show remarkable change. Because the subjects had experienced climbing above 6,000 m, it seemed that the endocrine responses of stress, sodium retention and antidiuresis were relatively mild. Urine and endocrine responses after exercise at 6,000 m became highly variant among the subjects. Endocrine responses of stress, sodium retention and antidiuresis after exercise at 6,000 m would be suggested to correlate with vulnerability to acute motion sickness during actual mountaineering. EFFECTS OF TRAINING AT SIMULATED ALTITUDE OF 6,000 m ON ENDOCRINE RESPONSES AT REST AND DURING EXERCISE AT THE SAME ALTITUDE [6,000 M SOTO KOSHO JUNNO TORENINGU NO TOKOSHO NI OKERU ANSEI OYOBI UNDOJI NAIBUNPITSU OTO NI OYOBOSU EIKYO]

Koh Mizuno, Isao Suganuma, Yasuhito Kumazaki, and Katsumi Asano *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Vol. 30, No. 3 1 Sep. 1993 p 117-125 In JAPANESE See also A94-12179 (For primary document see N94-28495 08-52)

Avail: CASI HC A02/MF A01

A study was conducted to elucidate the effect of intermittent hypobaric training on response of endocrine at rest and during exercise under hypobaric hypoxia at a simulated altitude of 6,000 m. Two male subjects; elite climber aged 35 years who had arrived over 7,000 m altitude (Testee 1), and beginner climber aged 27 years who had climbed only in comparatively low altitude mountains (Testee 2), trained in the hypobaric simulator for 8 times during 3.5 months. Simulated altitude, temperature, and relative humidity in the simulator were 6,000 m (354 Torr), 20 C, and 60 percent respectively. Training intensity was 30 minutes pedaling exercise under normoxia. At the first, fifth, and last training session, blood samples were taken before and after exercise at the 6,000 m simulated altitude. Heart Rate (HR) during exercise was monitored at all training sessions. Testee 2 showed remarkable increase of blood Adrenocorticotropic Hormone (ACTH), Antidiuresis Hormone (ADH), aldosterone, and Plasma Resin Activity (PRA) after exercise at the first training session, which tended to decrease as training progressed. Testee 1 showed almost no change of these hormones after exercise during all training sessions. Testee 2 showed about 20 to 30 beats/min decrease of HR during exercise with training progress. It might be concluded that intermittent hypobaric training cause the attenuation of stress and antidiuretic responses during exercise under hypobaric hypoxia for beginner climber and that elite climber should acquire attenuated responses of those hormones as a result of experience of severe hypoxia during actual mountaineering. Space food is an important subject of the manned space technology and some kinds of space food have been developed in USA and Russia. Although they meet the basic requirements, such as nutrition and preservation, some problems still remain from the viewpoint of crew comfort like hedonic acceptability. In this report, some investigations are made on the necessity of Japan's space food concerning physiological and psychological issues. These investigations are based on the hypothesis that the food having good acceptability on the ground (1 G) might have also good acceptability under the microgravity condition of space. As the first step to verify the hypothesis, a taste sensitivity test was carried out under the bed rest condition of HDT (Head Down Tilt), as a simulated microgravity condition. From the test results, no significant change of taste sensitivity is found between upright and HDT conditions. Therefore, the aforementioned hypothesis is supported on the universality of the food acceptance of humans under 1 G gravity and microgravity conditions. Author (NASDA)

NAVAL AVIATION VISION STANDARDS RESEARCH AT THE NAVAL AEROSPACE MEDICAL RESEARCH LABORATORY: THE LONG VIEW Special Report

Leonard A. Temme Apr. 1993 20 p

(AD-A275885; NAMRL-SR-93-2) Avail: CASI HC A03/MF A01

The Naval Aerospace Medical Research Laboratory (NAMRL) has been pursuing a research program to develop easily administered tests of vision skills that are valid, practical tools for the selection of personnel likely to be successful in the naval aviation arena. From 1980 to 1985, NAMRL maintained a data collection effort measuring the vision of U.S. Navy fighter pilots assigned to the air-to-air combat training range (NAS Oceana, VA). Both operational performance and vision test data were collected from the pilots. This report presents (1) the underlying theoretical orientation that guided that research effort, (2) a summary of the research results to date, and (3) the ideas guiding the design of the research strategy projected for the future. For convenience, abstracts of the principle publications describing this work are assembled in the appendix. DTIC

AVIATION EPIDEMIOLOGY DATA REGISTER: AGE DISTRIBUTION OF U.S. ARMY AVIATORS STRATIFIED BY GENDER AND COMPONENT OF SERVICE Final Report

Kevin T. Mason and S. G. Shannon Jan. 1994 26 p

(DA Proj. 3M1-62787-A-879)

(AD-A275901; USAARL-94-4) Avail: CASI HC A03/MF A01

The U.S. Army Aviation Epidemiology Data Register (AEDR) contains information on the history and physical parameters of Army aircrew members. As a reference for AEDR users and customers, the age distribution of Army aviators was extracted. The data were tabulated by age, gender, and component of service for calendar years 1986 through 1992. AEDR researchers can use the tables to calculate annual incidence rates, annual period prevalence rates, and other rates based on aviator-years of occupational exposure stratified by age, gender, and/or component. Aeromedical resource, policy and standards managers can use the tables for planning and funding aviator health care programs. DTIC

MARKOV CHAINS FOR RANDOM URINALYSIS 3: DAILY MODEL AND DRUG KINETICS Final Report, Oct. 1992 - Sep. 1993

Theodore J. Thompson and James P. Boyle Jan. 1994 20 p

(AD-A275540; NPRDC-TN-94-12) Avail: CASI HC A03/MF A01

This is the third in a series of reports on the use of Markov chains for the analysis of random urinalysis programs. A Markov model for random drug urinalysis testing that allows for daily variations in testing probabilities was developed. The formulation allows for any fixed length cycle (e.g., week, month). Drug kinetics and drug user gaming are incorporated into the Markov model via conditional probabilities. The Markov chain provides estimates of the distribution of time to detection and mean time to detection. The analyses have shown that time to detection varies dramatically with varying (observed) daily testing rates. Unequal daily testing rates provide opportunities for gaming drug users to extend the mean time to detection. Gaming is not possible with equal probabilities of testing across days. DTIC

DIGITAL TRACKING AND CONTROL OF RETINAL IMAGES M.S. Thesis

Steven F. Barrett 1993 17 p

(AD-A275469; AFIT/CI/CIA-93-28D) Avail: CASI HC A03/MF A01

Laser induced retinal lesions are used to treat a variety of eye diseases such as diabetic retinopathy and retinal tears or breaks. Both the location and size of the retinal lesions are critical for effective treatment and minimal complications. Currently, once an irradiation is begun, no attempt is made to alter the laser beam location on the retina. However, adjustments are desirable to correct for patient eye movements. Lesions form in much less than one second and typical treatment for a disease such as diabetic retinopathy requires as many as 2000 lesions per eye. This type of tedious task is ideally suited for computer implementation. A system has been developed to track a specific lesion coordinate on the retinal surface and provide corrective signals to maintain laser position on the coordinate. Six distinct retinal landmarks are tracked on a high contrast retinal image using two-dimensional blood vessel templates. Use of therapeutic lesions as tracking algorithm landmarks is also investigated. An x and y laser correction signal is derived from the landmark tracking information and provided to a pair of galvanometer steered mirrors to maintain the laser on a prescribed location. Once the laser position has been corrected, a function checks the terminal laser position for minor corrections. A development speed tracking algorithm has been implemented and tested using both vessel and lesion templates. Closed loop feedback control of laser position is demonstrated with calibrated retinal velocities and in vivo testing of the development system. Trade-off analysis of parameters affecting tracking system performance is used to specify requirements and implementation details for a real time system. DTIC

IMAGE TECHNOLOGY AND INFORMATION ANALYSIS OF BONE CHANGE WITH GRAVITATIONAL EXPOSURE

Kosuke Nishimura *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 1-10 See also A93-49177 (For primary document see N94-28850 08-52)

Avail: CASI HC A02/MF A01

The influences of gravitational changes (microgravity approximately equals 0 G, control: 1 G, hypergravity: 2 G) on the bone were analyzed from the point of view of imaging technology using a microfocus tube and a highly sensitive x-ray image sensor with the photostimulable phosphor. Gravitational changes markedly affected the spongy bone of the posterior vertebral joint, with bone resorption occurring at approximately equals 0 G and enhancement of bone formation at 2 G. Such changes were larger in the posterior vertebral joints that bear more weight. In the seventh posterior vertebral joint, which showed the largest bone changes, the photostimulated luminescence level increased by about 19 percent and decreased by about 4 percent at approximately equals 0 G and 2 G, respectively, compared with 1 G. These bone changes resemble those occurring during the aging process of mandibular bone trabeculae on earth. Author (NASDA)

ARTERIAL OXYGEN SATURATION DURING +Gz ACCELERATION BY SHORT-RADIUS CENTRIFUGE [KOGATA ENSHINKI NI YORU JINKO JURYOKU FUKACHU NO DOMYAKUKETSU SANSO HOWADO NO HENKA]

Kenichi Iwasaki, Hajime Suzuki, Masao Ito, Takaichi Mano, Chikako Saeki, and Kazuyoshi Yajima *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 11-17 In JAPANESE See also A93-49178 (For primary document see N94-28850 08-52)

Avail: CASI HC A02/MF A01

Artificial gravity has been proposed to prevent the problems of physiological deconditioning in space. When Ground-based studies to make an artificial gravity with short-radius centrifuge were intended, it has been reported that decreases of the arterial Oxygen Saturation (SaO2) caused by a ventilation/perfusion mismatch in human lung and a decrease in central blood volume were observed at +3 Gz or above it. However, the duration of centrifuge was only a few minutes. SaO2 was measured during 60 min +Gz acceleration by a pulse oximeter. Seven men were studied at 1.4 G, 1.7 G, and 2.0 G. Significant decreases of SaO2 occurred at 1.7 G from 10 min to 30 min and at 2.0 G from 10 min to 40 min. SaO2 were improved after 35 min (1.7 G) and 45 min (2.0 G). Increases in heart rate, blood pressure, and tidal volume improved the decreases of SaO2 during +Gz acceleration. Author (NASDA)

EFFECT OF CHRONIC CENTRIFUGATION ON IN VITRO FERTILIZATION AND EARLY DEVELOPMENT IN MICE OVA [MAUSU RANSHI NO JUSEI TO SHOKI HASSEI NI OYOBOSU JI FUKA NO EIKYO] **c51**

Masao Ito, Ruriko Maru, Takashi Maeda, Ester Sanada, Takaichi Mano, Shinichi Horigome, Kenichi Iwasaki, Yuichi Kameyama, Yoshiro Ishijima, and Kazuyoshi Yajima *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 19-25 In JAPANESE See also A93-49179 (For primary document see N94-28850 08-52)

Avail: CASI HC A02/MF A01

The effect of chronic centrifugation on in vitro fertilization and early development in mice ova was investigated. The results of the study on the effect of acceleration on fertilization and early development is discussed. The fertilization rate was lower for the ova receiving 0.6 to 1.2 G and those receiving 1.8 G and over. The mechanism for the impairment of fertilization, was apparently different between two ranges. The unfertilized ova that had been subjected to 0.6 to 1.2 G of acceleration ceased to grow mostly at Metaphase 2 and sperms penetration were prevented. In the ova receiving 1.8 G and over, sperms had penetrated the ovular cytoplasm and the nucleus had reached the Anaphase or Telophase. Polyspermy and other abnormalities were frequent while normally fertilized ova were limited in number. It was noted that centrifugation at 2 G or less

had no effect on the in vitro growth of 2-cell ova into blastcysts. Cell number of embryos thus produced was significantly smaller compared to the control. In the 2-cell ova receiving 3.6 or 4.0 G, most of them do not grow into blastocysts and if they do, the cell number of these blastocysts is smaller than 60. This finding suggested a delay in embryo growth and a subsequent increase in embryo mortality. Author (NASDA)

EFFECT OF FOOD INTAKE ON SKIN VASOMOTOR RESPONSES TO HEAD-UP TILT IN HUMANS
Atsuo Hirai, Yoshie Uketa, Minoru Tanabe, and Sotaro Sakurada *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 27-29 See also A93-49180 (For primary document see N94-28850 08-52)
Avail: CASI HC A01/MF A01

Cardiovascular responses to a 10 min head-up tilt at 60 deg were investigated in seven subjects before and after meal ingestion. The tilt increased heart rate and body core temperature, and decreased blood pressure, mean skin temperature (calculated from forehead, trunk, forearm, finger, thigh, calf and foot temperatures), and finger blood flow regardless of feeding conditions. However, finger temperature at the end of the tilt was significantly higher after food ingestion than before, which was not the case in other sites of the skin. Furthermore, the amount of reduction in finger blood flow was significantly reduced by food ingestion. These results suggest that vasoconstrictor drive to skin vessels is suppressed by food ingestion only in the fingers. Author (NASDA)

BASIC UNDERSTANDING OF VERTIGO [MEMAI NO KISO]
Motoyuki Hashiba *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 34-37 In JAPANESE Presented at the Symposium of the 38th Annual Meeting of Japan Society of Aerospace and Environmental Medicine, Tokyo, Japan, 3 Oct. 1992 (For primary document see N94-28850 08-52)
Avail: CASI HC A01/MF A01

Human kinesthesia is largely dependent on visual sense, vestibular sense, and somatic sense, and unbalance of these senses causes failure of integration, which may result in vertigo. Abnormal vertigo often occurs when the right and left vestibule senses different information. For example, when rotated, endolymphatic fluid in semicircular canals flows in the opposite direction in right and left, so that nerve activity is stimulated in one organ while suppressed in the other. For vertigo without rotation, a disorder must occur in one vestibular system to cause unbalanced nerve impulses. Physiological vertigo often occurs after rotation; that is, endolymphatic fluid flows by inertia after rotation, which keeps stimulating hairy cells, although visual and somatic nerves transmit contradictory information. In addition, the velocity storage mechanism in the semicircular canals may also prolong stimulation of hair cells. For other physiological vertigo, it was reported that caloric stimulation of the internal acoustic meatus causes vertigo. This phenomenon was explained by convection of endolymphatic fluid, however, in the experiment of caloric stimulation in outer space, vertigo occurred under weightless condition. Therefore, there may be mechanisms other than convection. In addition, it was known that vertigo was caused by visual stimulation alone. In studying vertigo, it is necessary to evaluate the subjective symptom by objective kinesthesia responses, however, such responses may be affected more or less by the central nervous system. DISTURBANCE OF EQUILIBRIUM ON JAL FLIGHT CREW [UNKO JOMUIN NI OKERU MEMAI]
Takakuni Kato *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 38-40 In JAPANESE Presented at the Symposium of the 38th Annual Meeting of Japan Society of Aerospace and Environmental Medicine, Tokyo, Japan, 3 Oct. 1992 (For primary document see N94-28850 08-52)
Avail: CASI HC A01/MF A01

Flight crew are obliged to undergo flight physical examination periodically by the Ministry of Transport. This examination must follow the flight physical examination manual that regulates standards of diagnosis for each organ disease, including acoustic and equilibrium sense. This article discusses the cases with disturbance of equilibrium and nystagmus. The subjects were 47 Japan Airlines (JAL) flight crew who were found to have either statoacoustic disorder or anamnesis in the physical examination. As a result, 19 cases were asymptomatic, and, in the other 28 cases, symptoms were recognized regardless of flight in most cases, although it happened during and after flight in some cases. A total of 8 cases were asymptomatic nystagmus. According to the standard of flight physical examination, flight crew who are found to exhibit a statoacoustic disorder must be scrutinized by electronystagmography (ENG), and if nystagmus is identified, the license will be suspended. However, it is a big loss of man-power to suspend from flight these crew who have no subjective symptoms and able to spend normal life. Author (NASDA)

SPACE AND VERTIGO: IN RELATION TO SPACE MOTION SICKNESS [UCHU TO MEMAI: UCHUYOI TONO KANREN NI TSUITE]
Masanori Ishii *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 41-45 In JAPANESE Presented at the Symposium of the 38th Annual Meeting of Japan Society of Aerospace and Environmental Medicine, Tokyo, Japan, 3 Oct. 1992 (For primary document see N94-28850 08-52)
Avail: CASI HC A01/MF A01

When a man goes to outer space, he will be exposed to weightless condition, so that the sense of space must be modified to adapt himself the new situation. The space motion sickness is considered to be a process to adapt oneself to weightless condition. However, the disease causes not only nausea and vomiting, but also disorder of equilibrium sense and illusion, which may degenerate operation ability of payload specialists. In fact, several missions had to be changed due to space motion sickness. This disease occurs immediately after coming to weightless condition, peaks at one to two day, and then gradually disappears in many cases. The cause may be disintegration of senses because input to the labyrinthus system and semicircular canal could be changed under weightless condition. To examine this theory, Occular Counter Rolling (OCR) has been used as an objective index of labyrinthus function, and it was proposed that difference between right and left OCR may be associated with space motion sickness. On the other hand, although in the same weightless condition, the disease did not occur in about one third of crew, and the incidence was affected by frequency of flight or physical conditions. Therefore, space motion sickness may result from not only disintegration of senses, but also from other factors such as effects of Antidiuretic Hormone (ADH) and enkephalin, which are associated with long term memory and is necessary for adaptation to a new environment. EQUILIBRIUM DYSFUNCTION IN THE CLINICAL FIELD [RINSHO NI OKERU MEMAI]
Jin Okubo *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Volume 30, No. 1 1 Mar. 1993 p 46-49 In JAPANESE Presented at the Symposium of the 38th Annual Meeting of Japan Society of Aerospace and Environmental Medicine, Tokyo, Japan, 3 Oct. 1992 (For primary document see N94-28850 08-52)
Avail: CASI HC A01/MF A01

This article presents symptoms and diagnosis of equilibrium dysfunction in the clinical field. In general, equilibrium dysfunction is a subjective symptom so that it is difficult to objectively diagnose. It is problematic to confirm diagnosis by only nystagmus test because not only vestibular disorders but also also visual and somatid disorders may cause equilibrium dysfunction. In fact, nystagmus is not always observed in equilibrium dysfunction patients. The equilibrium dysfunction can be classified into vertigo, dizziness and blackout, and this classification is important in diagnosis to identify the causal sites. For nystagmus tests, voluntary and involuntary occular movement is examined, however, there are a few outpatients who showed nystagnus in diagnosis. Induction and duration of nystagmus are also useful to identify the dysfunctional sites. In addition, accessory symptoms should be considered for diagnosis. It is interesting that the direction of nystagmus

is related to head position. Nystagmus by caloric stimulation changes in duration or development according to the head position. These phenomena suggest that gravity may intervene in the occurrence of nystagmus.

RELAXED TOLERANCE FOLLOWING HSG, HIGH SUSTAINED +Gz Interim Report, Nov. 1992 - Nov. 1993
Robert M. Shaffstaff Nov. 1993 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-92-C-0018)
(AD-A275204; AL/CF-PC-1993-0042) Avail: CASI HC A01

Changes in relaxed +G(sub z) tolerance impact the support required from G protective measures and may affect the capability of the aircrew to reengage following exposure to HSG. During and post-HSG, simultaneous physiological events which could increase or decrease G-tolerance are activated. This study exposed 6 male centrifuge subjects to a GOR(Gradual Onset Rate = 0.067 G/second) acceleration to their subjective G-tolerance limit. Following a rest period, the subjects were exposed to a 7+G(sub z) ROR (Rapid Onset Rate = 1.0 G/second) acceleration for 60 seconds. Immediately after the ROR the subjects were reexposed to the GOR and taken to their relaxed tolerance limit. RESULTS. The subjects relaxed tolerance on the first GOR (pre-HSG) was 5.4+G(sub z)+/-0.7 (X+/-SD) and their second GOR tolerance (post-HSG) was 4.5+/-0.6. Statistical significance via Student's T Test (2 tailed) was p=0.065, but 5 of 6 subjects had a reduction in post-HSi tolerance. Electrocardiogram and heart rate evaluations provided an indicator of the cardiovascular response. This study suggests that relaxed +G(sub z) tolerance is lowered following a high G exposure. Such a post-HSG reduction in relaxed tolerance would place a greater burden on the pilot's G protective systems thereby limiting one's ability to fully utilize the capability of the aircraft. DTIC

PHYSIOLOGICAL RESPONSES DURING SHIPBOARD FIREFIGHTING Final Report
Brad L. Bennett, R. D. Hagan, G. Banta, and F. Williams Jul. 1993 24 p
(AD-A275104; NHRC-93-9) Avail: CASI HC A03/MF A01

The findings from previous studies of men wearing firefighting clothing suggest a high potential for individual heat strain associated with firefighting. However, no study has determined the level of heat strain during actual firefighting conditions. Thus, the objective of this study was to determine the level of heat strain experienced by U.S. Navy personnel while combating fires aboard a fire research ship. Subject volunteers (n=9) were recorded for rectal and mean skin temperatures and heart rate during three fire test days. Air temperatures in the compartment containing the fire to be extinguished averaged 470 + or - 170 c, while air temperatures in the compartment from which the fire was fought ranged from 40 to 125 C. Peak values for rectal temperature averaged 39.2 + or - 1.0 C, while peak mean skin temperature averaged 39.5 + or + 0.9 C. Peak body heat storage averaged 2.02 + or - 0.77 kcal.kg-1 and peak heart rate averaged 186 + or - 13 bpm. Our findings indicate that shipboard firefighting is associated with a remarkable level of individual heat strain. These findings have applications to operational training programs, generation of exposure guidelines, and development of heat strain countermeasures. DTIC

EFFECTS OF ENDURANCE TRAINING ON HEAT-EXERCISE TOLERANCE IN MEN WEARING NBC PROTECTIVE CLOTHING Research Report
Yukitoshi Aoyagi, Tom M. McLellan, and Roy J. Shephard Aug. 1993 37 p
(AD-A275176; DCIEM-93-46) Avail: CASI HC A03/MF A01

Protective clothing imposes significant physiological and psychological stresses on the human body and may limit work tolerance, especially in hot environments. The additional strains imposed by protective clothing arise mainly because it is difficult for sweat to evaporate through relatively impermeable fabrics. Endurance training is a commonly adopted tactic to improve tolerance times when individuals must work in the heat. Potential benefits include improved physical fitness, increased sweating, and expanded plasma volume. However, it is unclear whether such responses develop and/or are helpful when wearing protective garments with limited vapor permeability. The purpose of this study was therefore to examine the influence of endurance training on exercise tolerance in a hot environment when subjects were wearing either normal light combat clothing or clothing offering protection against nuclear, biological, and/or chemical (NBC) agents. DECOMPRESSION SICKNESS RISK VERSUS TIME AND ALTITUDE Interim Report, Nov. 1992 - 1993
James T. Webb and Andrew A. Pilmanis Nov. 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-92-C-0018)
(AD-A275261; AL/CF-PC-1993-0039) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

To predict altitude decompression sickness (DCS) risk with any degree of accuracy, one must weigh variables such as prebreathe time, rate of ascent/descent, time at altitude, altitude, mixed breathing gas (dependent upon altitude), and profiles with multiple ascents and descents. The length of research chamber exposures is fixed. Therefore, risk assessment is based on DCS incidence after this fixed period at simulated altitude. From an operational standpoint, variable time at altitude complicates any predictive capability, although a computer model to handle all of these variables is in development. In the interim, a retrospective study from the Armstrong Laboratory Decompression Sickness Research Database has produced risk curves which can be used to predict DCS or venous gas emboli (VGE) incidence as a function of time at various altitudes. We limited the data to: (1) zero-prebreathe exposures to less than 20,000 ft breathing 50% O2, 50% N2; (2) zero-prebreathe exposures to less than 20,000 ft breathing 100% O2; and (3) 1-h prebreathe exposures to greater than 20,000 ft breathing 100% O2. Using the curves, one can select a time/altitude of exposure and estimate the DCS and VGE percentage. DTIC

Anesthetized sheep were exposed to explosions generated by the detonation of various weights of C-4 ranging in size from 57 to 1361 g in three different enclosures. The dimensions of the enclosures were 3.05 x 1.52 x 2.44 m, 3.05 x 2.44 x 2.44 m, and 4.88 x 3.05 x 2.44 m or 11.3, 18.2, and 36.3 cu m, respectively. The results from these experiments were used to establish an injury prediction curve using severity of injury indices and smoothed peak pressure. It appears to be an adequate model for the data collected and correlates well with previously reported injury prediction curves. It was determined that quasi-static pressure per se doesn't influence non-auditory injury to any appreciable degree. However, changes in the quasi-static pressure can affect the reverberant nature of the complex wave which seems to have a role in solid intra-abdominal response. There was also a simple relationship between lung injury and loading density demonstrated. As loading density increases, lung injury increases. DTIC

SYNAPTOGENESIS, SELECTIVE STABILIZATION, AND FREE ASSOCIATION Final Report

Mark A. Johnson and Raymond D. Scanlon Nov. 1993 20 p
(AD-A275250; ARCCB-TR-93039) Avail: CASI HC A03/MF A01

This report describes the material aspects of learning through the processes of synaptogenesis, transient redundancy, and selective stabilization. Synapses are potentiated during these processes and provide channels for incoming signal energy en route to nominate motor responses. They form codons that represent the activity of a large assemblage of neurons in various cortical regions. Codons are active during a state of dynamic instability in the neocortex when the thalamus blocks sensory input. They may also alter the gating cycle of the thalamus through interaction with the thalamic reticular nucleus. A computer simulation of these processes illustrates these concepts. DTIC

MICROGRAVITY BY PARABOLIC FLIGHT WITH MU-300 AIRCRAFT [MU-300 BIJINESU JETTOKI NI YORU MAIKURO G FURAITO] **c54**

Mitsuo Sato *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 1-8 In JAPANESE (For primary document see N94-29709 08-52)
Avail: CASI HC A02/MF A01

Parabolic flight has an advantage to achieve microgravity with ease and at a low-cost, as well as to enable the performance of science experiments by payload specialists themselves. This report summarizes results of a simulation study and actual flight for microgravity. Model flight pattern was determined on the basis of the most appropriate values for recovery gravity, maximum rising degree, maximum descending degree and pull-up gravity which were obtained by results of simulating calculation and test flights measuring gravity every 5 deg during chandelling and nose driving. In the test flights, the plane was controlled by manual steering, assuming that the stabilater trim was out of order. As a result, 1/100 to 5/100 G was achieved for an average of 20 seconds, maximum 24 seconds. The safety was confirmed in simulation calculation, determination of flight pattern, and structure and checking of the airframe. The microgravity experiments have been utilized for various fields, such as life science, material engineering, and physics. Author (NASDA)

SPACE MOVEMENT OF TRICHINELLA SPIRALIS UNDER MICROGRAVITY [SENMOCHU NO BISHO JURYOKU NI TAISURU YUEI HANNO] **c51**

Akira Murakami, Kenjiro Yoshimura, and Keiichi Takahashi *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 9-13 In JAPANESE (For primary document see N94-29709 08-52)
Avail: CASI HC A01/MF A01

Under microgravity, Trichinell speralis, including a Paramecium, increases pace of cytokinesis, probably because disappearance of space movement reaction against gravity decreases energy consumption. If this hypothesis is true, gravity may affect various phases of fundamental activity of this microorganism. On the other hand, it is known that a Paramecium moves in the opposite direction of gravity under 1 G. This negative gravitaxis may be associated with not only a physical mechanism based on gravity, but also some physiological mechanisms. The purpose of this study is to clarify the effect of gravity on Parameciums by analyzing space movement under microgravity. In previous studies, the microgravity effect on movement of Paramecium was examined during free falling. Despite short period, the findings revealed that not only gravity but also some other effects may participate in the special movement under microgravity. This study examined the movement for longer period of microgravity using parabolic flight, in which microgravity could be achieved after hypergravity conditions. As a result, the Parameciums showed diphasic movement pace which increased under hypergravity, then decreased during change of gravity, and increased again under microgravity. This phenomenon cannot be explained by only a physical mechanism, therefore some physiological mechanisms, such as Ca ion or K ion participation, may affect the movement under microgravity. POSTURE CONTROL OF GOLDFISHES UNDER MICROGRAVITY [BISHO JURYOKUKA NI OKERU KINGYO NO SHISEI SEIGYO] **c51**

Akira Takabayashi *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 14-18 In JAPANESE (For primary document see N94-29709 08-52)
Avail: CASI HC A01/MF A01

Microgravity may cause several functional disorders mainly due to a lack of stimulation of labyrinthus. This may result in Space Adaptation Syndrome (SAS) observed during exposure to a weightless condition. The purpose of this study was to examine the effect of microgravity on statokinetic system using goldfish with or without labyrinthectomy or excision of eye balls. It is known that fish control their posture by stimulation of light and gravity; i.e. they keep the back to the direction of light and the ventral side to the direction of gravity. As a result, labyrinthectomized goldfish could adapt themselves under 1 G condition, although it took several months. Under microgravity, normal goldfish controlled their posture by light direction. While hemilateral labyrinthectomized ones showed a tendency to incline to the labyrinthectomized side, those with hemilateral and bilateral labyrinthectomy controlled their posture by the direction of light. Goldfish with excision of eye balls could keep normal posture under 1 G, however, when labyrinthectomized goldfish were exposed to microgravity in the dark, looping behavior was observed. These results suggest that in labyrinthectomized fish's gravireceptors other than labyrinthus may function under 1 G, however, they cannot work under microgravity, which may cause unstable posture under microgravity. BEHAVIOR AND VISUAL CONTROL OF CYPRINODONTS UNDER MICROGRAVITY [BISHO JURYOKUKA NI OKERU MEDAKA NO KYODO TO SHIKAKU NI YORU SEIGYO] **c51**

Kenichi Ijiri, Hoshio Eguchi, Yasuko Taguchi, Shunji Nagaoka, Masamichi Yamashita, and Akemi Kurotani *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 19-25 In JAPANESE (For primary document see N94-29709 08-52)
Avail: CASI HC A02/MF A01

In order to collect fundamental data for the experiments under microgravity in IML-2 (International Microgravity Laboratory-2), behavior of

cyprinodonts was observed under microgravity, as well as with visual stimulation. Microgravity condition was achieved by parabolic flight, and cyprinodonts showed looping behavior with some twist as turning the ventral side to inside. There was a difference in looping pattern by strains of cyprinodonts in the light, while every strain of cyptinodonts showed looping behavior in the dark. This suggests that visual stimulation may be related with posture control under microgravity. For this reason, visual stimulation was given by rotating a cylinder with black and white stripes around a tank of cyprinodonts under 1 G. As a result, all strains of cyprinodonts followed the stripes, and among them, the strain with less looping behavior under microgravity showed the most remarkable ability to follow them. This suggests that the strain tolerant of microgravity have high sensitivity to visual stimulation. Author (NASDA)

START OF SPACE TOURISM [SUPESU TSURIZUMU KENKYU KOTOHAJIME] **c16**

Makoto Nagatomo *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 26-33 In JAPANESE (For primary document see N94-29709 08-52)

Avail: CASI HC A02/MF A01

Space tourism means commercialization of manned space flight. From the early stage of space development, space commercialization is a profound theme in multidisciplinary fields, on the basis of a principle that the outcomes of advanced technique developed by tax should be returned to citizens. In these days, space satellite system in which users pay a fee for utilization has succeeded commercially in business such as communication network or broadcasting, and an attempt has been made to observe the earth from outer space to resolve global problems, such as environmental destruction. There is also an increasing interest in space tourism, however, many obstacles should be overcome for the realization, especially the medical problems such as effect of acceleration, cosmic ray, noise or weightless condition. In addition, the space flight business should be managed on the commercial base so that reasonable cost and large number of passengers are essential. It is necessary to design rockets suitable for tourism. For attractive design, the policy of space tourism should be clarified. Author (NASDA)

A DISCUSSION OF EYE-HEAD COORDINATIVE MOVEMENT UNDER MICROGRAVITY DURING PARABOLIC FLIGHT [PARABORIKKU FURAITO NI YORU TEI JURYOKU KANKYOKA DENO HITO NO TOBU/GANKYU KYOUOU UNDO NO KENTO] **c53**

Kazuo Koga *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 34-41 In JAPANESE (For primary document see N94-29709 08-52)

Avail: CASI HC A02/MF A01

The labyrinthus can sense gravity as a mechanical stimulation of statoliths. In addition, some muscles which are always forced to be strained against gravity, baroreceptor and tactor on skin surface, and deep sensitivity of arthrosis can also sense gravity as a secondary information. There is a possibility that visual information may be indirectly related with sensing gravity. This multi-modal sensory is integrated in normal condition, however, the integration may be lost when environment is changed, such as in weightless condition. Therefore, it is meaningful to study man's adaptation to the microgravity by using visually up-down reversing mirror, and to study impression of a person he meets, with up-down position with or without the up-down reversing mirror. It can be predicted that the up-down reversing and front-back reversing have more eccentric cue other than visual sense so that the adaptation will be achieved more smoothly, than right-left reversing. For these reasons, eye-head coordination is going to be examined under microgravity achieved by parabolic flight. The measurement devices necessary for such experiment was discussed. This report explained the potential of parabolic flight, and measuring instrument of head movement, such as miniaturized three-axis acceleration sensor and optical position sensor. Author (NASDA)

ANALYSIS OF VARIOUS BIOLOGICAL ACTIVITY PARAMETERS DURING PARABOLIC FLIGHT [PARABORIKKU FURAITO NI OKERU KAKUSHU SEITAI SHINGO NO KAISEKI] **c53**

Shiro Usui and Yutaka Hirata *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 42-47 In JAPANESE Prepared in cooperation with NASDA, Tokyo, Japan; the Research Inst. of Environmental Medicine, Nagoya Univ., Aichi, Japan; and Nihon Univ., Tokyo, Japan (For primary document see N94-29709 08-52)

Avail: CASI HC A02/MF A01

Whether a man can keep vital activity in weightless condition largely depends on homeostasis, and the homeostasis is controlled by autonomic nervous system. Because pupillary response is also related with autonomic nervous system, it has been used as an index of autonomic nervous activity. In this study, the pupillary response as well as other biological activity parameters were measured in order to examine whether the response is useful for monitoring autonomic nervous activity during microgravity achieved by parabolic flight. As a result, heart rate, blood pressure and spirogram changed according to the change of gravity, and psychogalvanic response showed mental tension during parabolic flight. For pupillary response, diameter of the pupil, degree of miosis, delay of response time, maximum miosis velocity and maximum mydriasis velocity were determined as parameters. All of these parameters were changed according to change of gravity, which implies that these parameters can indicate autonomic nervous activity under microgravity. Author (NASDA)

HEMODYNAMIC MEASUREMENT DURING PARABOLIC FLIGHT [PARABORIKKU FURAITO NI OKERU JUNKAN DOTAI NO KEISOKU]

Akira Miyamoto, Shunji Nagaoka, and Seizo Ishikura *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 48-54 In JAPANESE (For primary document see N94-29709 08-52)

Avail: CASI HC A02/MF A01

Under microgravity such as in outer space, several changes may occur in the human body by movement of fluid. To examine the hemodynamic effect, microgravity condition was simulated by parabolic flight, and the change of hemodynamics was measured. During parabolic flight, the subject, a 28 year old healthy volunteer, experienced hypergravity of approximately 2.3 g prior to microgravity. The flight was performed from 9 to 11 times a day for six days. As a result, the measurements of blood pressure, heart rate, and stroke volume changed under microgravity. In addition, such changes were affected by time and sitting position; that is, when sitting up straight (90 deg), the change of gravity affected the heart rate and stroke volume more than when sitting in the halfway up (45 deg) position. Comparing heart rates between the first three days and later three days, the change decreased as time passed. These results suggest that hemodynamics may be affected by hypergravity and posture, as well as by experience, at least under microgravity by parabolic flight. Author (NASDA)

MOTION SICKNESS IN PARABOLIC FLIGHT: POSSIBILITY OF ELECTROGASTROGRAPHY AS AN OBJECTIVE INDEX [PARABORIKKU FURAITO NI OKERU MOSHON SHIKKUNESU: TAKAKUTEKI KYAKKANTEKI SHIHYO TO SHITENO IDENZU NO KANOSEI]

Hiroyuki Suzuki, Yoshiro Wada, and Satoru Watanabe *In* Society of Medical Research for Space Station, The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight Mar. 1993 p 55-63 In JAPANESE Sponsored by Science and Technology Agency, Tokyo, Japan (For primary document see N94-29709 08-52)

Avail: CASI HC A02/MF A01

Motion sickness is a disease that causes autonomic nervous symptoms such as vomiting or nausea by vestibular stimulation in weightless condition, linear acceleration, or by visual sense. Interest is focused on the disease from the point of space sickness. The purpose of this study was to discuss the effectiveness of electrogastrography as an objective index of

motion sickness under microgravity achieved by parabolic flight. The electrogastrogram obtained during parabolic flight was examined to determine if it is capable of being used as an objective index of motion sickness, whether it can predict vomiting, and whether it can reflect the change of gravity. As a result, there was a correlation between amplitude of electrogastrogram and motion sickness. In addition, electrogastrogram showed particular patterns before and during vomiting, although physiological events which are supposed to be reflected by this pattern are unknown yet. Electrogastrogram also showed changes of each pattern when gravity was changed. Author (NASDA)

EFFECTS OF MAKE-UP ON THE HEAT TRANSFER FROM THE HEAD IN HYPERTHERMIC CONDITIONS [MUFU KOON KANKYO DE TOBU NO NETSU IDO NI OYOBOSU KESHO NO EIKYO]

Atsuo Hirai, Kozo Hirata, Masami Hirashita, and Tetsuo Nagasaka *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Vol. 30, No. 2 1 Jun. 1993 p 55-62 In JAPANESE Sponsored by the Ministry of Education, Science and Culture, Tokyo, Japan; the Decente and Ishimoto Memorial Foundation for the Promotion of Sports Science, Osaka, Japan; and Kao Co. Ltd., Tokyo, Japan (For primary document see N94-29863 08-52)
Avail: CASI HC A02/MF A01

This study was performed to verify whether the make-up disturbs selective brain cooling in hyperthermic conditions. Seven male volunteers were subjected to passive body warming in a climatic chamber (air temperature, 25 C; relative humidity, 40 percent). Body warming was made for about 40 min by placing the subjects in a box-shaped body warming unit, enclosing all but the subject's head. When Esophageal Temperature (T(sub es)) reached a level 0.5 C higher than the prewarming temperature, Hand-Grip exercise (HG) at 20 percent of maximal strength commenced and continued until exhaustion. In subjects with make-up (Hyperthermia Cosmetic (HC)), increases in forehead skin blood flow and temperature were significantly less than compared with the control group (Hyperthermia Non-Cosmetic (HNC)). However, local thermal sensation of the face was significantly higher in HC than in HNC. Tympanic Temperature (T(sub ty)) was always higher than T(sub es) before body warming, but the relationship reversed about 30 min after the start of body warming. Compared with that in HNC, the difference between T(sub es) and T(sub ty) 30 min after the start of body warming became less in HC (HC: 0.05 C versus HNC: 0.09 C). There was no significant difference in blood pressure, heart rate, T(sub es), and T(sub ty) between the two groups. Endurance time for HG was also not different between the two groups. From these results, it is concluded that the make-up can disturb selective brain cooling during body warming, although the extent is small. Author (NASDA)

EFFECT OF WATER IMMERSION ON MUSCLE SYMPATHETIC NERVE RESPONSE DURING STATIC MUSCLE CONTRACTION [UNDOJI NO KIN KOKAN SHINKEI HANNO NI OYOBOSU SUISHIN NO KOKA]

Mitsuru Saito, Tadaaki Mano, Satoshi Iwase, Kazuo Koga, Chihiro Miwa, and Kinsaku Inamura *In* Japan Society of Aerospace and Environmental Medicine, Japanese Journal of Aerospace and Environmental Medicine, Vol. 30, No. 2 1 Jun. 1993 p 63-69 In JAPANESE See also A93-55328 (For primary document see N94-29863 08-52)
Avail: CASI HC A02/MF A01

To clarify the effects of microgravity on sympathetic nerve response to muscular exercise, Muscle Sympathetic nerve Activity (MSA) was recorded from the tibial or peroneal nerve microneurographically during Static Handgrip (SHG) exercise in a subject with a 20 degree head up tilt position under weightlessness simulated by water immersion (WET) and during dry condition (DRY). At the resting condition, MSA burst rate, which was .4 bursts/min in DRY, was strongly suppressed by 38 percent (3.6 bursts/min) of DRY under WET. This change was significant. Static handgrip increased MSA burst rate, 10.3 bursts/min in DRY and 10.7 bursts/min in WET at the second minute of SHG, while it showed insignificant change at the first minute period of SHG (-1.2 bursts/min in DRY and -1.7 in WET). The difference in delta in MSA burst rate during SHG between DRY and WET was insignificant. However, an absolute value of MSA burst rate during the second minute of SHG was higher in DRY (19.7 bursts/min) than that in WET (14.3 bursts/min). These results indicated that the MSA responsiveness to static muscle contraction was not altered under simulated weightlessness condition, but the level of MSA was significantly suppressed at resting condition and during muscular contraction. Thus the strong suppression of sympathetic outflow to the skeletal muscle under microgravity may be related, at least in part, to reduced adaptation of skeletal muscle function and the mechanism of muscular atrophy under microgravity.

Avail: CASI HC A02/MF A01

The effect of suspension hypokinesia on the maximal shortening velocity (Vmax) and the calcium (Ca(2+)) sensitivity (pCa(sub 50)) of slow and fast skinned muscle fibers in rats after two-week-tail-suspension and recovery for two weeks (two-week-recovery) was examined. Maximal tension in the fiber dissected from Extensor Digitorum Longus (EDL) muscle was significantly lower (p is less than 0.01), but that in the fiber dissected from soleus muscle not different from the cage control. The Vmax in soleus and EDL and Ca(2+) sensitivity (pCa(sub 50)) in EDL increased following suspension. The maximal tension in EDL, Vmax and Ca(2+) sensitivity (pCa(sub 50)) in soleus and EDL were normalized after two weeks of recovery. The results demonstrate that the rate constant of cross-bridge cycle is altered during hypokinesia and the altered muscle function during hypokinesia recovered to the control level when the rats were released from suspension for the same period as tail suspension. The following two experiments were carried out in normal subjects to verify the difficulty to detect the small target near the frame of windshield in the airplane: (1) using a tachistoscope, small black dot stimulus was exposed for 10, 30, 50, 70 and 0 msec at either side of and at either of 1.83, 2.24 and 2.65 degrees from the central fixation point with or without a pair of vertical lines. Nine subjects pushed a key to answer the side of

the dot exposed. The correct response rates increased while the reaction time decreased with the exposure time. Detectability of the dot stimulus near lines was poorer than that in the white background, especially for 0 msec stimulus exposure time; and (2) visual event-related potentials in response to the dot stimuli exposed for 0 msec were recorded from six scalp electrode sites in eight subjects. Two dots were exposed simultaneously at both sides of the fixation point with or without lines. The position of dots was 1.83 and 2.65 degrees and lines 1.32 and 3.15 degrees apart from the fixation point respectively. Dots were exposed 128 times (50 percent) randomly per each condition. Subjects were directed to count the number of the exposure with dots. The difference of the amplitude of P300 components between dot exposure and no-exposure was largest when the dots were exposed without lines. These results suggest the difficulty to detect targets near the frame of aircraft windshield.

TOXICITY OF CARBON MONOXIDE-HYDROGEN CYANIDE GAS MIXTURES: EXPOSURE CONCENTRATION, TIME-TO-INCAPACITATION, CARBOXYHEMOGLOBIN, AND BLOOD CYANIDE PARAMETERS Final Report

Donald C. Sanders, Arvind K. Chaturvedi, Boyd R. Endecott, Roxane M. Ritter, and Ngocoanh Vu Apr. 1994 13 p

(DOT/FAA/AM-94/7) Avail: CASI HC A03/MF A01

During aircraft interior fires, carbon monoxide (CO) and hydrogen cyanide (HCN) are produced in sufficient amounts to cause incapacitation and death. Time-to-incapacitation (t(sub i)) is a practical parameter for estimating escape time in fire environments. Exposures to CO-HCN mixtures have demonstrated that these gases have additive effects (producing shorter times to incapacitation), but the resulting concentrations of carboxyhemoglobin (COHb) and blood cyanide (CN(sup -)) at incapacitation are not well defined. These undefined relationships between COHb and blood CN(sup -) levels and the onset of incapacitation make the interpretation of postmortem levels difficult for medical accident investigators. To explore these relationships, t(sub i) was determined in laboratory rats exposed to 2 CO-HCN mixtures consisting of CO and HCN concentrations that produce 5- and 35-min t(sub i) in individual gas exposures; COHb and blood CN(sup -) concentrations were determined at incapacitation. In the high concentration CO-HCN mixture, the resultant t(sub i) was shortened from 5 min to 2.6 min; COHb dropped from 81 percent to 55 percent and CN(sup -) from 2.3 mu g/mL to 1.1 mu g/mL. At the lower concentration CO-HCN mixture, where the resultant t(sub i) was reduced from 35 min to 11.1 min, COHb dropped from 71 percent to 61 percent and blood CN(sup -) decreased from 4.2 mu g/mL to 1.1 mu g/mL. Comparison of the COHb and blood CN(sup -) values with the values from our singie gas exposure studies indicated that any alteration of the uptake of either gas in blood by the presence of the other was minimal. These findings suggest that changes in COHb and blood CN(sup -) may not be directly correlated with the onset of incapacitation and that postmortem blood levels should be carefully evaluated, particularly when both gases are present in fire victims. COMPUTER ASSISTED MEDICAL INTERVENTIONS: APPLICATION TO CONFORMAL RADIOTHERAPY

L. Brunie, P. Cinquin, L. Desbat, N. Laieb, Y. Menguy, S. Lavallee, J. Troccaz, P. Vassal, M. Bolla, and A. Dusserre et al Jun. 1993 30 p

Requirements and results of conformal external radiotherapy of prostatic carcinoma are presented. A system which achieves a high overall accuracy in the delivery of the prostatic boost is described. This system is based on the use of '2.5D' ultrasonic images for measuring the actual position of the prostate just before irradiation. Since these images are registrated with preoperative (computer tomography (CT) or magnetic resonance imaging) images, the position and orientation of the planning target volume is computed with respect to the irradiation system, and can be corrected accordingly. A second paper refers to the accurate repositioning of a patient with respect to CT images, which is essential for high precision radiotherapy. It is shown the intraradiotherapy portable imaging devices images may be automatically registered with three dimensional presession examinations, thus enabling an automatic adjustment of positioning. For individual titles, see N94-30029 through N94-30030.

CONFORMAL EXTERNAL RADIOTHERAPY OF PROSTATIC CARCINOMA: REQUIREMENTS AND PRELIMINARY RESULTS

J. Troccaz, Y. Menguy, M. Bolla, P. Cinquin, P. Vassal, N. Laieb, L. Desbat, A. Dusserre, and S. DalSoglio *In its* Computer Assisted Medical Interventions: Application to Conformal Radiotherapy Jun. 1993 13 p Sponsored by Digital Equipment Corp., and Siemens (For primary document see N94-30028 08-52)

Avail: CASI HC A03/MF A01

The aim of conformal radiotherapy is to deliver with a high precision a specific dose (which may be a high dose) to a planning target volume, while concurrently irradiating as little as possible healthy tissue and organs at risks. Radiation therapy may suffer from a number of problems that result in both over or undersizing the irradiation fields, simplifying the irradiation ballistics, and delivering an insufficient tumoral dose (to spare critical organs and reduce toxicity). One of these problems lies in the accurate positioning of the planning target volume with respect to the irradiation system, thence in the correct execution of the ballistics. A system aiming at achieving a higher overall accuracy in the delivery of prostatic boost for carcinoma of the prostate is described. The system is based on the use of '2.5D' ultrasonic images for measuring the actual position of the prostate just before the irradiation. Since these images are registrated with preoperative (computed tomography or magnetic resonance imaging) images, the position and orientation of the planning target volume is computed with respect to the irradiation system, and can be corrected accordingly. PRE- AND INTRA-RADIOTHERAPY MULTIMODAL IMAGE REGISTRATION: PRINCIPLES AND FIRST EXPERIMENTS

Lionel Brunie, Stephane Lavallee, Jocelyne Troccaz, Philippe Cinquin, and Michel Bolla *In its* Computer Assisted Medical Interventions: Application to Conformal Radiotherapy Jun. 1993 16 p Sponsored by Digital Equipment Corp., and Safir-Groupe SEM (For primary document see N94-30028 08-52)

Avail: CASI HC A03/MF A01

Accurate repositioning of the patient with respect to computer tomography (CT) images is essential for high precision radiotherapy. It is shown that intraradiotherapy portable imaging device images may be automatically registered with three dimensional presession examinations (typically morphological images like CT or magnetic resonance images), thus enabling an automatic adjustment of the planned strategy to the actual positioning of the patient. Based on computer vision techniques, the principles of this new method of multimodal image registration is presented, and the first experiments with a model are analyzed. ESA

CHARACTERISTICS OF SECONDARY ELECTRON EMISSION FROM CsI INDUCED BY X RAYS WITH ENERGIES UP TO 100 keV

A. Gibrekhterman, A. Akkerman, A. Breskin, and R. Chechik Jul. 1993 16 p

(DE94-608422; WIS-PH-93-60) Avail: CASI HC A03/MF A01 (US Sales Only)

Our microscopic model for low energy electron interaction in alkali-halides was used to simulate secondary electron emission from CsI, induced by X-rays of energies up to 100 keV. The integral 'current' and 'pulse' yields were calculated as a function of the X-ray energy, CsI convertor thickness and angle of incidence. We observed a decrease in true low energy (less than 50 eV) secondary electron yields at increasing X-ray energies and discuss the effectiveness of CsI convertors coupled to gaseous electron multipliers developed for fast, high resolution X-ray imaging. USE OF SNAKES TO LINK EDGE POINTS TO CREATE LEFT VENTRICULAR BOUNDARIES IN ECHOCARDIOGRAPHIC IMAGES

Iain Hunter (Strathclyde Univ., Glasgow, Scotland.) and Henri Maitre 23 Sep. 1993 37 p
(Grant SERC-92314900) (ISSN 0751-1345)
(TELECOM-93-D-016; ETN-94-95976) Avail: CASI HC A03/MF A01

The use of snakes to link edge points in left ventricular echocardiographic images to create the epicardial and endocardial boundaries is described. The edge points are created by an artificial neural network based radial search algorithm. This acts as a preprocessing stage for the snake and greatly reduces the size and complexity of the snake's external energy map. The edge points are given in terms of their polar coordinates, and the snake is used to interpolate where no edge points are present and to select the correct edge points for that boundary. The minimization of the snake's energy function by both simulated annealing and dynamic programming is studied, with dynamic programming giving better performance both in terms of accuracy and speed. The kinematics of closed nonsingular deformable manifolds with a codimension of one when their local instantaneous evolution obeys a first order dynamics is presented. A mathematical characterization of the complex phenomena modifying differential and integral properties of nonsingular manifolds during an arbitrary deformation is given. In particular, reactive diffusive propagative processes controlling the evolution of curvature features along the manifold are identified. A multidimensional deformable model, called a membrane/thin plate stabilizer under pressure or g-snake, is developed. Dealing with 2D (two dimensional) sequences or 3D images consisting of parallel slices, a model of 2D coupled g-snakes which preserves the intrinsic geometry of data is developed. To extend the scope of g-snakes to highly noisy imaging, a cooperation between deformable manifolds and regional filtering processes is introduced; the concept of 'deformable marker' for segmentation, focused on the 'interaction' process between a deformable model and image data. Exploiting controlled morphological techniques developed in mathematical morphology, a specific interaction process based on numerical geodesic reconstruction and automated initialization procedures is proposed. To increase segmentation accuracy, the 2D g-snake model is further generalized resulting in a fully adaptive deformable model which is invariant with respect to rigid transformations within the image space. The models were applied to segmentation and global tracking of deformable anatomical structures in medical images from various modalities within the framework of quantitative functional studies. ESA

AN EVALUATION OF PERSONALITY TESTING AND THE FIVE-FACTOR MODEL IN THE SELECTION OF LANDING CRAFT AIR CUSHION VEHICLE CREW MEMBERS
D. R. Street, Jr., K. T. Helton, and T. Nontasak 30 Jul. 1993 21 p (AD-A275869; NAMRL-1385) Avail: CASI HC A03/MF A01

The purpose of our investigation was to determine if personality testing and a five-factor model could improve the selection of Landing Craft Air Cushion (LCAC) vehicle crew members. Vehicle crew members for the LCAC are currently selected on the basis of their performance on a computer-based psychomotor selection system. The various psychomotor tests in the selection system have demonstrated predictive validity in LCAC crew training. Certain personality characteristics may also be involved in the LCAC vehicle crew training success. In fact, various researchers have found that personality testing may improve the selection of Navy/Marine Corps aviators. There is increasing evidence that a five-factor model may be useful in describing the personality characteristics involved in training success. We believe that a five-factor model may improve the selection system used for LCAC vehicle crew members. A principal component analysis with varimax rotation was conducted to determine the underlying structure of the Adult Personality Inventory (API) with 168 LCAC crew candidates. The resulting factor scores were then analyzed using advanced statistical techniques to determine the relation of the personality factor scores and the performance-based test to an underway grade in training criterion. The results indicated that one personality factor, openness, significantly improved predictions of the criterion (p less than 0.05). Based on these results, we believe that personality testing would improve the selection of LCAC vehicle crew members. DTIC

NON-INTRUSIVE GAZE TRACKING USING ARTIFICIAL NEURAL NETWORKS

Shumeet Baluja and Dean Pomerleau 5 Jan. 1994 14 p
(Contract N00014-93-1-0806)
(AD-A275186; CMU-CS-94-102) Avail: CASI HC A03/MF A01

An artificial neural network based gaze tracking system which can be customized to individual users was developed. A three layer feedforward network, trained with standard error back propagation, is used to determine the position of a user's gaze from the appearance of the user's eye. Unlike other gaze trackers, which normally require the user to wear cumbersome headgear or to use a chin rest to ensure head mobility, the system is entirely nonintrusive. Currently, the best intrusive gaze tracking systems are accurate to approximately 0.75 degrees. An accuracy of 1.5 degrees was achieved with the nonintrusive system, while allowing head mobility. In its current implementation, the system works at 15 Hz. An empirical analysis of the performance of a large number of artificial neural network architectures is presented. Suggestions for further explorations for neurally based gaze trackers are provided, and are related to other similar artificial neural network applications such as autonomous road following.

HUMAN PILOT RESPONSE DURING SINGLE- AND MULTI-AXIS TRACKING TASKS Final Report, 8-11 Oct. 1993
Craig R. Edkins, Benjamin J. Coffey, John Kruzinauskas, Jr., Darcy Granley, and Mary McNeely Dec. 1993 193 p
(AD-A275080; AFFTC-TLR-93-41) Avail: CASI HC A09/MF A03

This report presents the results of a limited evaluation of human pilot response during single and multiaxis tracking tasks. A five member team from the USAF Test Pilot School conducted this evaluation at Buffalo, New York, from 8-11 October 1993. Five sorties totalling 7.6 hours were flown in the Calspan variable stability Lear 2 aircraft. Ground simulations in Lear 2 were also performed. Four different pitch and four different roll dynamics were evaluated using three different single and multiaxis tracking tasks. For each set of dynamics, primary pilot response parameters were recorded and examined using Fourier transform analysis in an attempt to provide a data base for pilot model development and validation. Pilot comments and Cooper-Harper ratings were also recorded. This report serves as a guide for flight test data and gives an initial look at the test results.

(AD-A275223; AFOSR-94-0038-TR) Avail: CASI HC A05

This report contains the five manuscripts (one published, two in-press, one in-review, and one in-preparation) and six published abstracts completed during the three year grant period. These include descriptions of the four original research projects completed during the grant period. STUDY 1 was designed to test the effects of illumination on human nocturnal serum melatonin levels and performance. Results indicate that overnight exposure to 300, 1500, or 3000 lux of light significantly diminished serum melatonin levels in a dose-dependent manner. Performance on vigilance, reaction time, and other tasks deteriorated throughout the night, consistent with known circadian variations in these parameters, but independent of ambient light intensity and circulating melatonin levels.

TEMPORAL AND QUALITATIVE DECOMPOSITION OF PLAUSIBLE REASONING Final Technical Report, 15 Mar. 1991 - 15 Jun. 1993
David A. Swinney and Edward E. Smith 15 Dec. 1993 12 p
(Grant AF-AFOSR-0225-91)
(AD-A275073; AFOSR-94-0002TR) Avail: CASI HC A03/MF A01

The goal of this work is to detail the temporal course of information integration during plausible reasoning, with a focus on: (1) the component processes in terms of their time-courses and information content; (2) the degree to which reasoning consists of 'modular' (autonomous, independent, informationally encapsulated) stages of processing; and (3) how components of reasoning are drawn together to eventuate in a single answer to a reasoning problem. This work has involved three relevant lines of inquiry: (1) Conceptual Combination. The set of studies in this area demonstrated that claims by Springer and Murphy to the effect that conceptual combination takes place such that initial components of the combination are not activated and processed separately, are not supported. (2) Reasoning and Categorization. These studies have demonstrated that evidence from Rips that categorization can take place based on reasoning as well as on similarity, seems to be true, but only under conditions where the informational basis for categorization is quite sparse and when the subject is aware that his/her basis for the categorization must be defended. (3) Modularity and Discourse. A claim by Marslen-Wilson and Tyler purporting to demonstrate an important lack of modularity of processing during discourse/sentence comprehension was examined in detail utilizing a more sensitive task. It was demonstrated that modularity between semantic and syntactic information was maintained during this (particularly critical) stage of language processing. (4) Reasoning and Cognition in Neurologically Involved Populations. A series of studies focussing on the role of language in plausible reasoning, studied the degree to which early modular processes are disrupted by brain damage and aging. It was demonstrated that the early cognitive/language processing is robustly modular.

This thesis presents NL-Soar, a detailed computational model of human sentence comprehension that accounts for a broad range of psycholinguistic phenomena. NL-Soar provides in-depth accounts of structural ambiguity resolution, garden path effects, unproblematic ambiguities, parsing breakdown on difficult embeddings, acceptable embeddings, immediacy of interpretation, and the time course of comprehension. The model explains a variety of both modular and interactive effects, and shows how learning can affect ambiguity resolution behavior. In addition to accounting for the qualitative phenomena surrounding parsing breakdown and garden path effects, NL-Soar explains a wide range of contrasts between garden paths and unproblematic ambiguities, and difficult and acceptable embeddings: the theory has been applied in detail to over 100 types of structures representing these contrasts, with a success rate of about 90%. The account of real-time immediacy includes predictions about the time course of comprehension and a zero-parameter prediction about the average rate of skilled comprehension. Finally, the theory has been successfully applied to a suggestive range of cross-linguistic examples, including constructions from head-final languages such as Japanese.

SCANNING AND MONITORING PERFORMANCE: EFFECTS OF THE REINFORCEMENT VALUES OF THE EVENTS BEING MONITORED Final Report
P. G. Rasmussen and A. M. Revzin Apr. 1994 9 p
(DOT/FAA/AM-94/8) Avail: CASI HC A02/MF A01

We formulated a hypothesis suggesting that operators could make scanning and monitoring errors if they tended to concentrate on a 'high-value' display sub-area while ignoring 'low-value' problems elsewhere on the display. Such 'data' would have application to Air Traffic Control Specialist (ATCS) jobs. We tested the hypothesis in an experiment rewarding good performance in a laboratory task. Subjects monitored two visual display 'work areas' with defined task difficulty. In the high-value work area, each error cost the subjects four or ten times as much as in the low-value work area. The data obtained suggest that differing task error penalties, or reinforcement values, can induce a greater than usual frequency of errors in some subjects. Rewarding good performance in two-work area tests without differing error penalties did not induce significant error rate differences, nor did such rewards significantly affect total task performance levels. This was true even in tests where such differential attention could benefit the subject's overall performance score, thereby increasing subject's performance bonus. However, about 15 percent of our subjects showed a marked tendency to concentrate their attention on a display sub-area having

high-value events while periodically ignoring events elsewhere on the display. Such information may be useful in reducing the frequency of scanning errors by revising training protocols or personnel selection criteria. Author

Background information on concepts of mental workload and stress and the possibility of indexing them by means of spectral analysis of heart rate is presented. A literature review of practical implementations of the technique in laboratory and field studies is provided with the purpose of evaluating its utility as a tool in the study of mental workload and stress. SIMULATION OF THE EFFECT OF WIND ON CLOTHING BY MEASUREMENTS AND CALCULATIONS
Hannu Anttonen, Esa Hiltunen, and Ralf Oesterlund 1993 49 p
(ISSN 1235-0621)
(PB94-132289; VTT/PUB-133; ISBN-951-38-4251-7) Copyright Avail: CASI HC A03/MF A01

The conventional measuring methods of thermal resistance R(ct) and water vapor resistance R(et), do not give enough information about the function of winter clothing in different conditions. In the study, two self-constructed cylinders were used, with diameters of 300 and 200 mm, both 500 mm in height. The cylinder was placed in a wind-tunnel in the climatic chamber where ambient temperature (-15 to +5 C) and wind velocity (1 to 8 m/s) were adjustable. Skin temperature and sweating level of the cylinder were controlled by a computer. The development of measuring method, the theory, and the clothing models are under progress, but is is obvious that cylinder measurements are suitable especially in windy conditions. NTIS

KEY COGNITIVE ISSUES IN THE DESIGN OF ELECTRONIC DISPLAYS OF INSTRUMENT APPROACH PROCEDURE CHARTS Final Report, Nov. 1992 - Jul. 1993
Melanie C. Clay Nov. 1993 111 p
(AD-A275647; DOT-VNTSC-FAA-93-18; DOT/FAA/RD-93/39) Avail: CASI HC A06/MF A02

This report provides a general introduction to the field of cognitive psychology and the application of well researched cognitive issues to the design of electronic instrument approach procedures (EIAP) displays. It presents 46 cognitive issues and 108 design principles. Its basic premise is a recognition of the need for the pilot to get unambiguous information as quickly and easily as possible in such a way that it can be remembered until the time that it must be used. Recognition and discriminability of patterns, stress resulting from heavy workload, the effects of divided attention, and the need to take account of the pilot's expectations are discussed. The merits of color and size, paper and electronic display, and temporary removal of nonessential information are examined. Among the conclusions made by the report are recommendations for more investigation in the following areas: symbol design, grouping and coding of information, orientation and scaling of information, control of clutter, and ways of overcoming the harmful effect of interruptions to attention or to performance of sequential actions. A RELIABLE AND REPEATABLE METHOD FOR VOLUME CALCULATION OF PRESSURIZED GARMENTS Interim Report, May - Nov. 1993
Ricardo Perez, III, John H. Ohlhausen, and Philip J. Preen Nov. 1993 5 p
(Contract F33615-92-C-0018)
(AD-A275600; AL/CF-PC-1993-0051) Avail: CASI HC A01/MF A01

A rapid, accurate and efficient method to conduct inflation, volume and leak tests on pressure containing personal protective garments was developed and validated. The new system consists of a computer data acquisition and process control system that integrates flow rate over time to calculate volume. Validation of the new test system was accomplished by comparing the volumes calculated by the computer with volumes actually measured via a wet spirometer. Results from the validation study showed that the computerized system was highly accurate. In addition, the computerized system allows suits to be rapidly and effectively evaluated. DTIC

DESIGNING FOR PERFORMANCE: A COGNITIVE SYSTEMS ENGINEERING APPROACH TO MODIFYING AN AWACS HUMAN COMPUTER INTERFACE Final Report, Jan. 1991 - Feb. 1993
David W. Klinger, Stephen J. Andriole, Laura G. Militello, Leonard Adelman, and Gary Klein Mar. 1993 109 p
(Contract F33615-90-C-0533)
(AD-A275187; AL/CF-TR-1993-0093) Avail: CASI HC A06/MF A02

Cognitive systems engineering (CSE) is primarily a blend of technological opportunities, findings from cognitive research, and cognitive task analysis. Using CSE, we were able to produce an efficient and effective redesign of the AWACS weapons director (WD) station. The revised WD station was tested using 17 WD's. These WD's performed defensive counter air missions with both the current interface and the revised interface. The training of

the participants on the revised interface was quite brief (4.5 hours). As a result, the WD's did not achieve the same degree of familiarity or automation with the revised interface that they have with the current interface. Yet, when WD's were using the revised system, their performance improved. This is indicated by an increase in performance for a number of process and outcome measures. Also, a skilled WD provided blind ratings of WD performance. These global ratings were significantly higher for the revised interface. The effectiveness of the revised interface suggests that it is possible to pinpoint cognitive task requirements and to make these the driving factors in a design effort. The use of CSE ray be a feasible aspect of the design process, enabling system developers to achieve a much stronger effectiveness at relatively low cost. DTIC

COMPARISON OF TWO COOL VESTS ON HEAT-STRAIN REDUCTION WHILE WEARING A FIREFIGHTING ENSEMBLE IN A HOT/HUMID ENVIRONMENT Final Report
Brad L. Bennett, R. D. Hagan, K. A. Huey, C. Minson, and D. Cain Jul. 1993 27 p
(AD-A275103; NHRC-93-10) Avail: CASI HC A03/MF A01

Understanding the impact of heat strain on the performance of naval personnel has important application to shipboard fire-suppression activities. Firefighting is associated with heat strain as demonstrated by large increases in skin and core temperatures and near maximal heart rates (Duncan et al., 1979; Romet and Frim, 1987; Bennett et al., 1992). These responses can attribute to body heat production caused by wearing 30 to 40 pounds of personnel protection equipment, the physical effort associated with carrying equipment (e.g., fire hose, ventilation fans), and the heat gain due to exposure to high ambient temperature and humidity. AN INVESTIGATION OF STEREOPSIS WITH AN/AVS-6 NIGHT VISION GOGGLES AT VARYING LEVELS OF ILLUMINANCE AND CONTRAST M.S. Thesis
Jeffrey J. Armentrout 1993 81 p
(AD-A275332; AFIT/CI/CIA-93-160) Avail: CASI HC A05/MF A01

The increased reliance on night operations by the military over the last few decades has led to the development of various night imaging devices. Night vision goggles (NVG's) are one device which have gained widespread use in nighttime helicopter operations. However, rotorcraft accident data have indicated an increased occurrence of 'pilot error' type accidents when NVG's are in use. NVG related accidents often can be linked to extremely poor ambient lighting and contrast conditions during nighttime operations as well as the imaging limitations of the NVG's. Research has shown that NVG's reduce visual acuity and depth perception when compared to unaided daylight viewing conditions. In this study the effects of illumination and contrast on stereoscopic vision with and without AN/AVS-6 goggles were investigated. Stereoacuity was measured using a modified Howard-Dolman apparatus with four levels of illumination and three levels of contrast. DTIC

COMPARATIVE CENTRIFUGE EVALUATION OF THE AIR FORCE ADVANCED TECHNOLOGY ANTI-G SUIT (ATAGS) AND THE NAVY ENHANCED ANTI-G LOWER ENSEMBLE (EAGLE) Final Report, Sep. 1992 - Dec. 1993
John W. Burns and Ronald C. Hill 30 Dec. 1993 6 p
(AD-A275348; AL/CF-PC-1993-0052) Avail: CASI HC A02/MF A01

The centrifuge evaluation of the ATAGS and EAGLE was undertaken to determine which extended coverage anti-G suit would enter engineering and manufacturing development for joint service use. Eight male centrifuge subjects were used. The subjects were wearing either an ATAGS, with or without pressure socks, or an EAGLE. Pressure breathing during G (COMBAT EDGE) was used with all three combinations. The combinations were randomized to eliminate any order effect. The arms of all subjects were wrapped from the wrist to the axilla with 3 in. wide elastic bandage to reduce the possibility that subjects might stop the +G(sub z) exposure for arm pain rather than for fatigue or light loss. GOR, ROR, and 5-9 SACM +G(sub z) profiles were used to compare the suits. Although not significantly different, the average number of 9G plateaus completed for the ATAGS with socks, the ATAGS without socks, and the EAGLE were 8.0, 7.8, and 6.5, respectively. Subject HR, while wearing the ATAGS with pressure socks, was significantly ($p = .03$) lower than HR while wearing the EAGLE during the 5G plateaus of the 5-9 +G(sub z) SACM. The perceived effort involved in the straining maneuver during the 5-9 SACM with the EAGLE was consistently, but not significantly, greater across the 9G plateaus compared to the ATAGS with pressure socks. However, there was a significant ($p = .032$) suit/time interaction between the ATAGS with pressure socks and the EAGLE. There was no significant difference in subject HR or +G(sub z) tolerance between the three G-suit combinations during the GOR or ROR +G(sub z) exposures. DTIC

PROCEDURES AND METRICS FOR ANTI-G SUIT EVALUATIONS Interim Report, Nov. 1992 - Nov. 1993
Grady L. Ripley, Richardo Perez, III, and Daniel H. Bauer Nov. 1993 5 p
(Contract F33615-92-C-0018)
(AD-A275349; AL/CF-PC-1993-0043) Avail: CASI HC A01/MF A01

The ATAGS (Advanced Technology Anti-G Suit) design process initially relied on comments made by human test subjects to subjectively evaluate the effects of design changes on inflation characteristics. A standardized test method was needed to objectively quantify the effects of the design changes and also to compare the inflation characteristics of other anti-G suits. Therefore, a test was designed to measure the filling characteristics of different anti-G suits fitted to a standard mannikin. Several factors had to be considered in developing a test method that was both operationally significant and provided consistently valid data. The factors considered were as follows: don/doff requirements, the effects of evacuation of the anti-G suits prior to testing, mannikin position, and additional life support equipment worn with the anti-G suit. Parameters measured to assess the inflation characteristics were flow rate, fill times, and differential pressures in the suit. DTIC

REMOTE CONTROL OF TRANSCRANIAL DOPPLER (TCD) PROBE DURING CENTRIFUGE EXPOSURES UP TO 9 +Gz Final Report, Oct. 1987 - Dec. 1993
Ulf I. Baldwin, Paul Werchan, and Travis Eddy Jan. 1994 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-87-D-0609)
(AD-A275253; AL/CF-PC-1993-0046) Avail: CASI HC A02

TCD systems have been successfully used in clinical practice for estimating cerebral perfusion by registering blood flow velocity in the middle cerebral artery. However, when used in centrifuges, probe movement during high +Gz have resulted in the loss of Doppler signal making interpretations of data very difficult. To solve this problem, the Doppler probe and three electrical motors were mounted on a tightly fitted helmet. Remote control of these motors allows precise tilting and sliding of the probe during G exposures. Vertical movement of the probe is recorded when a good flow velocity signal is achieved. On succeeding G-exposures, the probe is moved to the predicted positions for different G-loads when the G-load changes. A computer program to automate this process is currently under development. With this device, blood flow velocity in the middle cerebral artery can be registered at G-loads up to 9 +Gz with increased accuracy. DTIC

STRESS AND ERGONOMIC DESIGN AND EVALUATION OF PERSON-MACHINE SYSTEMS Final Report, Jan. 1992 - May 1993
Herschel C. Self May 1993 35 p
(AF Proj. 7184)
(AD-A275156; AL/CF-SR-1993-0008) Avail: CASI HC A03/MF A01

This report was written to make system designers and developers more stress-conscious and more alert to sources of potentially harmful operator stress. They are then more capable of designing person-machine systems in which stress is optimized, in which equipment and operating procedures are a good fit to system operators. In such systems, worker morale and performance are maintained, and the lifecycle system costs are less. Despite careful design efforts aided by preproduction tests and

evaluations, person-machine systems often come into wide use with unanticipated and potentially harmful stress-related operator problems. How this can happen is made evident by examining stress in general and stress in and out of the workplace. Examples of stress and strain are given. Stress from inadequate visual conditions is given special emphasis. The presentation is from ergonomic or application viewpoint. A stress checklist is given in the appendix. DTIC

ADVANCED SEAL DELIVERY SYSTEM LIFE SUPPORT PARAMETERS Technical Report, May - Dec. 1993
M. E. Knafelc Dec. 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275304; NEDU-2-94) Avail: CASI HC A03

The purpose of this document is to provide a guideline to the technical evaluation board when reviewing the proposals for the Advanced SEAL Delivery System (ASDS). These guidelines are based upon a design that consists of at least two habitable compartments. The pilot and navigator will occupy one compartment, and its internal pressure will be maintained at 1 ATA. Another habitable compartment will hold the divers, and its inside pressure can be adjusted to permit controlled compression and decompression, or be maintained at a constant 1 ATA. The habitable chambers will be kept dry. Because of safety, environmental, and human factors' considerations, it is desirable for the lock-out chamber to be separate from the habitable compartments. INSULATIVE PROPERTIES OF TWO THERMO-METAL NEOPRENES Research Report
Michael B. Ducharme and John Frim Dec. 1993 17 p
(AD-A275209; DCIEM-93-53) Avail: CASI HC A03/MF A01

The objective of the present study was to compare the thermal resistance of two thermo-metal neoprenes (titanium and stainless steel coated) to the current Canadian Forces Arctic diving suit neoprene (CF-N) in dry and wet environment. The test in the dry environment were conducted using a Rapid-k thermal conductivity instrument, and in the wet environment using a custom-made apparatus. The dry tests were conducted at 1 atmosphere in the laboratory, and the wet tests were done in a hyperbaric water chamber maintained at 5 C and at depths of 0, 10, 25, 50, and 100 m. Pre- and post-dive tests were performed on the same samples to investigate the effects of two dives on the thermal resistance of the neoprenes. It was found that the thermal insulation of the two thermo-metal neoprenes tested was significantly higher than that of the CF-N in both the dry and the wet environments. The best thermo-metal neoprene, the stainless steel coated neoprene, averaged an improvement of 53% in the dry and 60% in the wet environment (ranging from 70% at 0 m to 34% at 100 m). The insulative properties of the thermo-metal neoprenes were affected, however, by the dives, decreasing by about 12% after two dives. It was concluded that the stainless steel thermo-metal neoprene could be a potential alternative to the current CF Arctic diving suit neoprene but further testing is needed on the long term effects of dives and aging on the insulative properties of the material. EVA GLOVE EVALUATION METHODOLOGY AND TEST PROTOCOL Ph.D. Thesis
Elaine Marie Hinman-Sweeney 1993 244 p
Avail: Univ. Microfilms Order No. DA9324440

One of the most critical components of a spacesuit is the gloves, yet gloves have traditionally presented significant design challenges. With the continued and varied efforts at glove development, a method for evaluating glove performance is needed. This dissertation presents a pressure glove evaluation protocol. A brief history of extra-vehicular activity (EVA) glove development and test procedures is given. A description of this evaluation protocol, and its development is provided. The protocol allows comparison of one glove design to another, or any one design to bare handed performance. Gloves for higher pressure suits may be evaluated at current and future design pressures to drive out differences in performance due to pressure effects. Using this protocol, gloves may be evaluated during design to drive out design problems and determine areas for improvement or fully mature designs may be evaluated with respect to mission requirements. Several different test configurations are presented to handle these cases. A glovebox, set of tasks, and a methodology to evaluate glove performance was developed. Evaluating comfort has been a difficulty in glove testing. A technique for quantifying comfort data is presented. This protocol was run on a prototype glove. The prototype was evaluated at two operating pressures and in the unpressurized state, with results compared to bare-handed performance. Results and analysis from this test series are provided, as is a description of the test configuration used for this test . Dissert. Abstr.

MAINTAINING ACCEPTABLE THERMAL COMFORT WITH A LOW AIR TEMPERATURE BY MEANS OF LOCAL HEATING
R. Soerlie 13 Jul. 1993 11 p See also DE85750802
(PB94-138526; STF15-A93053) Avail: Issuing Activity (National Technical Information Service (NTIS))

The main objective was to assess (1) the lower room temperature for acceptable thermal comfort of the person seated at the desk, and (2) to assess the energy-saving qualities of the local heater. During the experiments various temperatures, air velocity, radiant flux and thermal asymmetry were all measured. The thermal mannequin was used in order to verify the level of thermal comfort and was constructed in such a way as to be thermally equivalent to a human. The local heater creates a local microclimate with satisfactory thermal comfort for the person seated at the desk, while the temperature in the rest of the room can be as low as 17-18 C. Supplementary thermal simulations carried out on computer showed that it is possible to save heating energy by reducing the general room temperature. NTIS

THE USE OF TASK NETWORK SIMULATION IN WORKLOAD PREDICTION

Mary Margaret Schuck and Keith C. Hendy 1992 7 p

(DCIEM-92-32; CTN-94-61138) Avail: CASI HC A02/MF A01

As aviation systems become increasingly complex, it becomes more important to design these systems within the capabilities and limitations of their operators. Practical workload and performance prediction techniques are thus required for the design of systems. One technique which has proven useful is task network simulation. This approach produces a simulated task timeline for the given mission, but must be linked with some model of human information processing in order to make workload or performance predictions. The use of task network simulation within the Canadian Department of National Defence for the prediction of workload during the early design of complex man-machine systems is reviewed. The measures of workload used within the simulation are detailed, with particular emphasis on the use of task rating scales and task conflict matrices. The modifications to these two tools made at the Defence and Civil Institute of Environmental Medicine are presented as well as their present and future applications. Author (CISTI)

CIRCADIAN COUNTERMEASURES FOR SHIFTWORKERS DURING USMP-2: A REPORT TO MISSION MANAGEMENT Final Report

Karen T. Stewart and Julie Hayes Apr. 1994 30 p

(NASA Order H-13012-D)

(NASA-CR-195260; NAS 1.26:195260) Avail: CASI HC A03/MF A01

People who must work at night experience a number of physiological and psychological difficulties. These include sleepiness and fatigue at work, poor daytime sleep, gastrointestinal distress, impaired concentration and performance, disturbed mood, and increased health complaints and risk of disease. These difficulties arise because nocturnal work and daytime sleep take place at inappropriate phases of the body's circadian rhythms. Intense artificial light can shift the phase of human circadian rhythms, and can thus be used to promote adaptation to shifted work schedules. The first attempts to investigate the efficacy of light treatment for MSFC POCC shiftworkers took place during USML-1 and ATLAS-2. The findings from these studies led to the development of a Circadian Countermeasures Program that was implemented during USMP-2. Light treatment and other circadian countermeasures were employed to promote adjustment to mission shiftwork in POCC cadre volunteers. Treatment protocols were designed and customized for each volunteer's work hours and personal preferences. Treatment protocols included some or all of the following: scheduled self-administration of intense light, scheduled avoidance or attenuation of sunlight at other times, and sleep schedules. Data from post-mission questionnaires indicated that volunteers found the program to be effective, convenient, and beneficial. Author

TACTILITY AS A FUNCTION OF GRASP FORCE: EFFECTS OF GLOVE, ORIENTATION, PRESSURE, LOAD, AND HANDLE

Ram R. Bishu (Nebraska Univ., Lincoln.), Lisa A. Bronkema (Nebraska Univ., Lincoln.), Dishayne Garcia (Wichita State Univ., KS.), Glenn Klute, and Sudhakar Rajulu May 1994 23 p

(NASA-TP-3474; S-761; NAS 1.60:3474) Avail: CASI HC A03/MF A01

One of the reasons for reduction in performance when gloves are donned is the lack of tactile sensitivity. It was argued that grasping force for a weight to be grasped will be a function of the weight to be lifted and the hand conditions. It was further reasoned that the differences in grasping force for various hand conditions will be a correlate of the tactile sensitivity of the corresponding hand conditions. The objective of this experiment, therefore, was to determine the effects of glove type, pressure, and weight of load on the initial grasping force and stable grasping force. It was hypothesized that when a person grasps an object, he/she grasps very firmly initially and then releases the grasp slightly after realizing what force is needed to maintain a steady grasp. This would seem to be particularly true when a person is wearing a glove and has lost some tactile sensitivity and force feedback during the grasp. Therefore, the ratio of initial force and stable force and the stable force itself would represent the amount of tactile adjustment that is made when picking up an object, and this adjustment should vary with the use of gloves. A dynamometer was fabricated to measure the grasping force; the tests were performed inside a glove box. Four female and four male subjects participated in the study, which measured the effects of four variables: load effect, gender effect, glove type, and pressure variance. The only significant effects on the peak and stable force were caused by gender and the weight of the load lifted. Neither gloves nor pressure altered these forces when compared to a bare-handed condition, as was suspected before the test. It is possible that gloves facilitate in holding due to coefficient of friction while they deter in peak grasp strength. Author (revised)

AIDING THE OPERATOR IN THE MANUAL CONTROL OF A SPACE MANIPULATOR

J. F. T. Bos, H. G. Stassen, and A. vanLunteren 29 Jun. 1992 11 p

Presented at the 5th IFAC/IFIP/IFORS/IEA Symposium on Analysis, Design and Evaluation of Man-Machine Systems, The Hague, Netherlands, 9-11 Jun. 1992 Sponsored by Netherlands Technology Foundation Prepared in cooperation with Fokker Space and Systems Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-125549; NLR-TP-92261-U; ETN-94-95586) Avail: Issuing Activity (European Space Agency (ESA))

Three problems faced by an operator when controlling a space manipulator manually were investigated: lack of direct vision, up to six degrees of freedom to be controlled, and slow and complex dynamics. The results showed that reference lines enhance the three dimensional perception; further automation of the insert task led to a more efficient task execution; the display of the stopping configuration can lead to a faster and safer task execution. The display of the predicted trajectory led to less energy consumption due to a more calm control behavior. The length of the prediction horizon should equal half of the stopping time. ESA

SAMPLING BEHAVIOUR IN A FOUR INSTRUMENT MONITORING TASK: EFFECTS OF SIGNAL BANDWIDTH AND NUMBER OF EVENTS PER SIGNAL

H. G. M. Bohnen, M. A. M. Leermakers, and P. J. Venemans 31 Dec. 1992 35 p Submitted for publication Sponsored by the Co-Operation Centre of Tilburg and Eindhoven Universities Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-B179613; NLR-TP-92386-U; ETN-94-95960) Avail: CASI HC A03

The effect of global signal characteristics, such as bandwidth and number of events on human sampling behavior, is investigated. Whether or not the influence of these characteristics on sampling strategy is affected by local (actually observed) signal features, such as the degree with which a sampled signal value falls short of an event region and the rate of change, is examined. Four independent, numerically displayed signals were used; two different bandwidths and two different event numbers were chosen. To take a sample, subjects had to use a mouse. The mouse key responses were used as an index of sampling. It was demonstrated that both bandwidth

and number of events equally affected the distribution of samples over signals. In addition, it was shown that global signal characteristics determine sampling behavior less prominently when the attentional demands brought about by the local features become of greater importance. This indicates that not predictability as governed by global signal characteristics as such, but rather predictability given certain local signal features is a crucial factor in determining sampling behavior. ANALYSIS AND DESIGN OF INFLATABLE AEROSPACE STRUCTURES Ph.D. Thesis
John Alan Main 1993 227 p
Avail: Univ. Microfilms Order No. DA9324454

This dissertation presents a new structural model for the bending behavior of inflated cylindrical fabric structures that are used as beams. The goal of this investigation was twofold: to perform a fundamental investigation into the static and dynamic bending behavior of the inflated fabric beam and to apply the results to practical problems faced in the design of aerospace inflated structures. Fundamental work was done in development of a model for the static and dynamic bending behavior of the inflated beam. The bending analysis of the inflated beam resulted in a differential equation of bending for the unwrinkled regions of the beam that is identical to the Euler Bernoulli solution. A more complex differential equation was found when the fabric wrinkled due to the applied moments. Experimental work was performed to verify the bending model for the inflated beam. Excellent agreement was found between the model and experimental results in static bending tests of a number of inflated cantilever beams. Dynamic tests were performed and mode shapes, natural frequencies, and damping mechanisms for the inflated beam examined. A series of dynamic tests were also performed on the NASA KC-135 Low Gravity Simulator aircraft to determine the sensitivity of the dynamics of inflated beam structures to changes in gravitation level. Large changes in structural damping were found to occur across G level. This basic research was used to predict the dynamics of a complex inflated structure, a mockup of an inflated solar concentrator. Structural modeling was performed using a finite element software package and the lower modes of vibration of the inflated structure were accurately predicted by the finite element model. The inflated beam bending model also proved itself immediately useful in aerospace applications since many of the current space suit components are essentially fabric tubes. Recommendations for improving space suit flexibility that have arisen from this research include reducing the modulus and increasing the Poisson's ratio of the fabric. A series of experiments were performed to prove these concepts. The results of those tests and the space suit glove design recommendations arising from them are included in this work. Dissert. The National Storage Laboratory (NSL) was organized to develop, demonstrate, and commercialize technology for the storage systems that will be the future repositories for our national information assets. Within the NSL, four Department of Energy laboratories and the IBM Federal Systems Company, have pooled their resources to develop an entirely new High Performance Storage System (HPSS). The HPSS project concentrates on scalable parallel storage systems for highly parallel computers as well as traditional supercomputers and workstation clusters. Concentrating on meeting the high end of storage system and data management requirements, HPSS is designed using network-connected storage devices to transfer data at rates of 100 million bytes per second and beyond and to handle storage capacities measured in petabytes. The resulting products will be portable to many vendor's platforms. The three year project is targeted to be complete in 1995. This paper provides an overview of the requirements, design issues, and architecture of HPSS, as well as a description of the distributed, multi-organization, industry and national laboratory HPSS project. PERFORMANCE ANALYSIS OF MEMORY HIERACHIES IN HIGH PERFORMANCE SYSTEMS Ph.D. Thesis
A. Yogesh Jul. 1993 53 p
(Contract W-7405-eng-82)
(DE94-005549; IS-T-1673) Avail: CASI HC A04/MF A01

This thesis studies memory bandwidth as a performance predictor of programs. The focus of this work is on computationally intensive programs. These programs are the most likely to access large amounts of data, stressing the memory system. Computationally intensive programs are also likely to use highly optimizing compilers to produce the fastest executables possible. Methods to reduce the amount of data traffic by increasing the average number of references to each item while it resides in the cache

are explored. Increasing the average number of references to each cache item reduces the number of memory requests. Chapter 2 describes the DLX architecture. This is the architecture on which all the experiments were performed. Chapter 3 studies memory moves as a performance predictor for a group of application programs. Chapter 4 introduces a model to study the performance of programs in the presence of memory hierarchies. Chapter 5 explores some compiler optimizations that can help increase the references to each item while it resides in the cache. DOE

DATA FUSION AND CORRELATION TECHNIQUES TESTBED DEVELOPMENT. PHASE 1: INTERIM REPORT
28 Sep. 1990 37 p Submitted for publication
(SKD-1600-73-015; DSIS-94-00233; CTN-94-61128) Avail: CASI HC A03/MF A01

The Data Fusion and Correlation Testbed (DFACT) prototype system was conceived to provide a prototype platform for design, development, and implementation of software architectures and communications sensor information analysis and correlation algorithms suitable for a multiprocessor computer system. Achievements and lessons learned from the first phase of DFACT prototype development are summarized. The first phase involves development of a baseline system that will provide a demonstration platform to enable potential users of the system to evaluate it and provide feedback for further development. Four areas of investigation are reviewed: the intercept operator workstation, the analyst workstation, the data simulator, and system integration. In addition, results of the audio processing study performed for this phase is included, as well as a discussion of issues pertinent to the development environment. Author (CISTI)

There is considerable interest in developing optical interconnects for multi-chip modules (MCM). As a consequence, there is the basic need to develop a methodology for partitioning the system for effective utilization of the optical and electronic technologies. For the given system design, the key question to be answered is concerned with where to use optical interconnections. This paper introduces the Computer Aided Design (CAD) approach for partitioning opto-electronic systems into Opto-Electronic Multichip Modules (OE MCM). We will first discuss the design tradeoff issues in optoelectronic system design including speed, power dissipation, area, and diffraction limits for free space optics. We will then define a formulation for OE MCM partitioning and describe new algorithms for optimizing this partitioning based on the minimization of the power dissipation. The models for the algorithms are discussed in detail and an example of a multistage interconnect network is given. Different results, with the number and size of chips being variable, are presented where improvement for the system packaging has been observed when the partitioning algorithms are applied. DTIC

(NASA-CR-195736; NAS 1.26:195736; JPL-D-1272) Avail: CASI HC A05/MF A02

The NSC 800 is an 8-bit CMOS microprocessor manufactured by National Semiconductor Corp., Santa Clara, California. The 8-bit microprocessor chip with 40-pad pin-terminals has eight address buffers (A8-A15), eight data address – I/O buffers (AD(sub 0)-AD(sub 7)), six interrupt controls and sixteen timing controls with a chip clock generator and an 8-bit dynamic RAM refresh circuit. The 22 internal registers have the capability of addressing 64K bytes of memory and 256 I/O devices. The chip is fabricated on N-type (100) silicon using self-aligned polysilicon gates and local oxidation process technology. The chip interconnect consists of four levels: Aluminum, Polysi 2, Polysi 1, and P(+) and N(+) diffusions. The four levels, except for contact interface, are isolated by interlevel oxide. The chip is packaged in a 40-pin dual-in-line (DIP), side brazed, hermetically sealed, ceramic package with a metal lid. The operating voltage for the device is 5 V. It is available in three operating temperature ranges: 0 to +70 C, -40 to +85 C, and -55 to +125 C. Two devices were submitted for product evaluation by F. Stott, MTS, JPL Microprocessor Specialist. The devices were pencil-marked and photographed for identification. Derived from text

INVARIANTS, FRAMES AND POSTCONDITIONS: A COMPARISON OF TWO FORMAL SPECIFICATION NOTATIONS
J. Bicarregui and B. Ritchie Dec. 1993 31 p
(PB94-138153; RAL-93-100) Avail: Issuing Activity (National Technical Information Service (NTIS))

VDM and B are two 'model-oriented' formal methods. Each gives a notation for the specification of systems as state machines in terms of a set of states with operations defined as relations on that set. Each has a notion of refinement of data and operations based on the principles of reduction of non-determinism and increase in definedness. This paper makes a comparison of the two notations through an example of a communications protocol previously formalized. Two abstractions and two reifications of the original specification are given. Particular attention is paid to three areas where the notations differ: to the use of postconditions that assume the invariant as opposed to postconditions that enforce it; to the explicit 'framing' of operations as opposed to the 'minimal frame' approach; and to the use of relational postconditions as opposed to generalized substitutions. IMAGE-ADAPTED VISUALLY WEIGHTED QUANTIZATION MATRICES FOR DIGITAL IMAGE COMPRESSION Patent Application
Andrew B. Watson, inventor (to NASA) 25 Jan. 1994 28 p
(NASA-Case-ARC-12015-1; NAS 1.71:ARC-12015-1;
US-Patent-Appl-SN-186366) Avail: CASI HC A03/MF A01

A method for performing image compression that eliminates redundant and invisible image components is presented. The image compression uses a Discrete Cosine Transform (DCT) and each DCT coefficient yielded by the transform is quantized by an entry in a quantization matrix which determines the perceived image quality and the bit rate of the image being compressed. The present invention adapts or customizes the quantization matrix to the image being compressed. The quantization matrix comprises visual masking by luminance and contrast techniques and by an error pooling technique all resulting in a minimum perceptual error for any given bit rate, or minimum bit rate for a given perceptual error. Avail: CASI HC A03/MF A01

This thesis studies the relationship by creating a tool (FTAPE) that integrates a high stress workload generator with fault injection and by using the tool to evaluate system performance under error conditions. The workloads are comprised of processes which are formed from atomic components that represent CPU, memory, and I/O activity. The fault injector is software-implemented and is capable of injecting any memory addressable location, including special registers and caches. This tool has been used to study a Tandem Integrity S2 Computer. Workloads with varying numbers of processes and varying compositions of CPU, memory, and I/O activity are first characterized in terms of performance. Then faults are injected into these workloads. The results show that as the number of concurrent processes increases, the mean fault latency initially increases due to increased contention for the CPU. However, for even higher numbers of processes (less than 3 processes), the mean latency decreases because long latency faults are paged out before they can be activated. Author

(DE94-005565; IS-M-752; CONF-9305276-2) Avail: CASI HC A02/MF A01

We present results of tests of 8, 10, and 12 bit ADC's that operates in the range of 10 to 120 megasamples per second (MSPS). Tests include measurements of differential non-linearity, integral non-linearity, the effective number of bits, and the word error rate. Because the tests are performed on all devices with the same signal sources and the same software, direct comparisons between devices can be made. We also present results from testing a radiation hardened ADC at ionizing radiation exposures up to 81 MRad. DOE

POLYNOMIAL MODELING OF ANALOG-TO-DIGITAL CONVERTERS
O. M. Solomon, Jr. 1994 10 p Presented at the 1994 Measurement Science Conference, Pasadena, CA, 27-28 Jan. 1994
(Contract DE-AC04-76DP-00789)
(DE94-005579; SAND-94-0011C; CONF-940151-1) Avail: CASI HC A02/MF A01

Analog-to-digital converters are frequently modeled as a linear polynomial plus a random process. The parameters of the linear polynomial are the familiar gain and offset of the analog-to-digital converter. The output of the random process is uniformly distributed on plus or minus the least significant bit of the analog-to-digital converter. In this paper, the transfer function of an analog-to-digital converter is modeled as a nonlinear polynomial plus a random process. This model can explain the generation of harmonics by the analog-to-digital converter, but the simpler linear model cannot. The parameters of the nonlinear polynomial are estimated from the response to the analog-to-digital converter to a sine wave. The model parameters are used to estimate the nonlinear part of the transfer function of the analog-to-digital converter. DOE

DYNAMIC MICROSETS FOR RAMs
J. A. LaPoutre Jul. 1993 13 p Sponsored in part by Royal Netherlands Academy of Arts and Sciences Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract EC-7141) (ISSN 0924-3275)
(RUU-CS-93-22; ETN-94-95659) Avail: CASI HC A03

A generalization of the concept of Gabow and Tarjan's microsets to dynamic microsets is presented. The dynamic microsets allow the use of direct addressing in a RAM (Random Access Machine) for incremental problems that can be partitioned into subproblems which are merged from time to time. A sequence of operations on dynamic microsets can be performed in O(n + m.alpha(m, n)) time, where n is the size of the problem and m is the number of queries. ESA

The objective of the project described in the report - the OOCAD project - was to further refine and develop previous work in the Finnish construction industry concerning computerized methods for describing and designing buildings as product models. The work included the development of a formal generic product model on a conceptual level (the OOCAD model) based on object-oriented concepts and the definition of a neutral data exchange file format (the OXF-format) mapping the model as closely as possible. The model is based on a hierarchical composition of objects with part-of relationships where the data of real world entities, such as buildings, consist of two kinds of objects: types and instances. This dualism was introduced to avoid redundant data: the type objects describe the common data of one or several identical objects, such as shape and material, whereas the instance objects describe occurrence-specific data, such as position. ANALYTIC RENDERING OF CURVILINEAR VOLUME DATA
Wes Bethel Mar. 1993 11 p
(Contract DE-AC03-76SF-00098)
(DE94-004934; LBL-33808) Avail: CASI HC A03/MF A01

A technique is presented for analytically rendering volume data from curvilinear grids. The method employs analytic techniques for manipulating and rendering curvilinear voxels. A curvilinear voxel is represented using a cubic triparametric solid formulation. The control points defining the cubic triparametric voxel are computed from the original curvilinear grid using the Catmull-Rom formulation, and subsequently rendered using a three dimensional forward difference operator. The primary benefit from using such a representation is the fact the voxel shape and data values are C1-continuous across voxel boundaries. The issue of voxel opacity, both at the subvoxel and supervoxel levels, is investigated. The use of both tricubic representation and rendering, along with the new approach to managing voxel opacity, results in images which are markedly different from those presented in previous work. SOFTWARE SYSTEMS REENGINEERING PROCESS MODEL, VERSION 1.0
1993 43 p
(AD-A275711) Avail: CASI HC A03/MF A01

The Center for Information Management (CIM) Software Systems

Reengineering Process Model provides guidance for applying software reengineering technology for the development and modernization of automated information systems (AIS's) within the Department of Defense (DoD). The CIM is chartered to support the Director of Defense Information by providing information management technical services to the DoD community. The services are an integral part of the Corporate Information Management program, a DoD-wide effort to streamline business operations and processes which will help improve the design of cost-effective, standard information systems. This paper defines the CIM software reengineering process composed of activities for creating AIS's to support current business needs. The purpose of the CIM Software Systems Reengineering Process Model is to capture the essence of software reengineering as it applies in the DoD Information Management (IM) community. The activities described in the Model compose the software reengineering process, including Define Project (initial project planning), Reverse Engineer, and Forward Engineer. The Model is represented using the IDEFO Activity Modeling technique, the DoD standard for process modeling. DTIC

THE BOOTSTRAPPED ALGORITHM: A FAST ALGORITHM FOR BLIND SIGNAL SEPARATION Final Report, Apr. 1992 - Jun. 1993
Yeheskel Bar-Ness, Abdulkadir Dinc, Hagit Messer-Yaron, Zoran Siveski, and Raafat Kamel Dec. 1993 157 p
(Contract F30602-88-D-0025)
(AD-A275759; RL-TR-93-236) Avail: CASI HC A08/MF A02

The bootstrapped algorithm was introduced in a previous report, RL-TR-93-24, dated April 1993. The different structures were proposed and shown to be suitable for blind signal separation and interference cancellation. It was demonstrated that the speed of convergence of these algorithms is much faster than other algorithms. Unlike other algorithms, the speed of convergence does not depend on the signals' power ratios and, hence, does not depend on the eigenvalue spread of the input correlation matrix. Further studies of these algorithms are reported in this section, which includes questions related to bandwidth, complexity, and dynamic studies for real-time control. Also reported are studies of spatial separation and direction-of-arrival estimation of wideband signals as well as application of the algorithm for broadband interference cancellation. Some preliminary results on applications to the blind decision feedback equalizer and separation of CDMA signals are also included. DTIC

GUIDE TO THE ENVIRONMENTAL-LANGUAGE In-House Report, Jun. - Aug. 1993
Jason Hamshar Dec. 1993 46 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 5581)
(AD-A275849; RL-TR-93-203) Avail: CASI HC A03

The Environmental-Language (E-L) was designed and developed by Dr. Mike Karr of Software Options Inc., and Harvard University. The software performs most of the functions of a Configuration Management system and an Activity Coordination system. It is constructed on top of the Emacs text editor (Emacs is part of GNU and copyrighted 1985, 1986) using the ELSP programming language embedded in Emacs. Configuration Management is the process which monitors multiple programmers working on a project and provides the capability to document each others work without over-writing others. All changes are tracked and recorded. In lieu of working with files, E-L operates on artifacts, which differ in that they are: In theory, never deleted; Alterations are handled by creating new artifacts; By saving previous versions, the user can rollback in the event of problems; Typed, such as Unix-programs, C-modules, C-source, or Lisp-modules, rather than by extension conventions. Activity Coordination manages activations, which are formalized by transaction graphs. With E-L servers running on multiple hosts, an activity (known as a process) will execute in parallel across these member sites distributed according to each system's utilization and uninhibited by the host's architecture and operating system. POLYANILINE MEMBRANES FOR GAS AND LIQUID SEPARATION Abstract Only
Jeanine A. Conklin, Shu-Chuan Huang, and Richard B. Kaner 7 Feb. 1994 2 p
(Contract N00014-93-1-1307)
(AD-A275851) Avail: CASI HC A01/MF A01

Membrane separation systems have gained attention recently as low cost energy-saving methods of purification. Mixtures are separated based on chemical or physical interactions with the polymer membrane. Current membrane systems are limited by the difficulty involved in predicting polymer morphology prior to synthesis and in modifying of the polymer's morphology after film formation. However, polyaniline membranes can be tailored after film formation through the doping and undoping process. In this report we discuss the utility of polyaniline as liquid and gas separation membranes. Morphological changes to the polyaniline membrane and the effect these changes have on separations are explored. DTIC

REASONING ABOUT PROGRAMS BY EXPLOITING THE ENVIRONMENT Interim Report
Limor Fix and Fred B. Schneider 2 Feb. 1994 44 p
(Contract N00014-91-J-1219)
(AD-A275852) Avail: CASI HC A03/MF A01

A method for making aspects of a computational model explicit in the formulas of a programming logic is given. The method is based on a new notion of environment--an environment augments the state transitions defined by a program's atomic actions rather than being interleaved with them. Two simple semantic principles are presented for extending a programming logic in order to reason about executions feasible in various environments. The approach is illustrated (1) discussing a new way to reason in TLA and Hoare-style programming logics about real-time and by (2) deriving the first TLA and Hoare-style proof rules for reasoning about schedulers. TRANSFERABLE OUTPUT ASCII DATA (TOAD) EDITOR VERSION 1.0 USER'S GUIDE
Bradford D. Bingel, Anne L. Shea, and Alicia S. Hofler Feb. 1991 145 p
(Contract NAS1-19038; RTOP 505-59-10-03)
(NASA-CR-187507; NAS 1.26:187507) Avail: CASI HC A07/MF A02

The Transferable Output ASCII Data (TOAD) editor is an interactive software tool for manipulating the contents of TOAD files. The TOAD editor is specifically designed to work with tabular data. Selected subsets of data may be displayed to the user's screen, sorted, exchanged, duplicated, removed, replaced, inserted, or transferred to and from external files. It also offers a number of useful features including on-line help, macros, a command history, an 'undo' option, variables, and a full compliment of mathematical functions and conversion factors. Written in ANSI FORTRAN 77 and completely self-contained, the TOAD editor is very portable and has already been installed on SUN, SGI/IRIS, and CONVEX hosts.

A NEW METHOD FOR RECOGNIZING QUADRIC SURFACES FROM RANGE DATA AND ITS APPLICATION TO TELEROBOTICS AND AUTOMATION, FINAL PHASE Final Report, period ending 28 Feb. 1994
Roland Mielke, Ivan DCunha, and Nicolas Alvertos Mar. 1994 61 p Original contains color illustrations
(Grant NAG1-1223)
(NASA-CR-195733; NAS 1.26:195733) Avail: CASI HC A04/MF A01; 1 functional color page

In the final phase of the proposed research a complete top to down three dimensional object recognition scheme has been proposed. The various three dimensional objects included spheres, cones, cylinders, ellipsoids, paraboloids, and hyperboloids. Utilizing a newly developed blob determination technique, a given range scene with several non-cluttered quadric surfaces is segmented. Next, using the earlier (phase 1) developed alignment scheme, each of the segmented objects are then aligned in a desired coordinate system. For each of the quadric surfaces based upon their intersections with certain pre-determined planes, a set of distinct features (curves) are obtained. A database with entities such as the equations of the planes and angular bounds of these planes has been created for each of the

quadric surfaces. Real range data of spheres, cones, cylinders, and parallelpipeds have been utilized for the recognition process. The developed algorithm gave excellent results for the real data as well as for several sets of simulated range data. Author

COMPARING Ada AND FORTRAN LINES OF CODE: SOME EXPERIMENTAL RESULTS Final Report, Apr. - Nov. 1993
Thomas P. Frazier, John W. Bailey, and Melissa L. Young Nov. 1993 46 p
(AD-A275322; AD-E501740; IDA-P-2899; IDA/HQ-93-044552) Avail: CASI HC A03/MF A01

This paper presents the results of an experiment in rewriting four FORTRAN programs in the Ada computer language. We counted and compared the numbers of lines of code in both languages. We found Ada programs to be larger than their functionally equivalent FORTRAN counterparts. However, we observed that the overhead for Ada diminishes as the program size is increased. Our limited data suggested that there may even be a cross-over point beyond which the size of an Ada program is smaller than a functionally equivalent FORTRAN program. DTIC

BUSINESS PLANNING MODEL USER'S GUIDE
Dec. 1993 17 p
(Contract DAAK70-92-D-0003)
(AD-A274978) Avail: CASI HC A03/MF A01

The Belvoir Business Planning Model (BPM) was developed to provide an efficient means of collecting and analyzing data concerning future revenue projections and spending plans. The overall idea of this model is to balance the estimated costs against the available revenue. This balancing is available at any appropriate level of analysis: at the FOE/function level, at the laboratory/directorate level, and at the center level. In general, the model tries to estimate most nonsalary personnel related expenses, based upon the amount of the government payroll. It uses multiplier factors for such things as travel and transportation costs rather than having the user input these costs specifically. This frees the user from having to estimate them manually and enhances the ability to perform rapid 'what if' analyses. Changes in related expenses due to simple changes in revenue or personnel projections can be quickly recalculated rather than having to completely reevaluate and reenter the other costs. DTIC

AUTOMATED INTERFACE FOR RETRIEVING REUSABLE SOFTWARE COMPONENTS M.S. Thesis
Scott J. Dolgoff Sep. 1993 410 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275004) Avail: CASI HC A18

The Computer Aided Prototyping System (CAPS) software base contains software components described by formal specifications written in the Prototype System Description Language (PSDL). One problem addressed is the development of a retrieval mechanism for extracting components that match user-provided PSDL specifications. Another problem addressed is the integration of a retrieved component into a software prototype. The approach taken was to match specifications by comparing operations and parameter types to include indirect subtype relations. Integrating a selected software base component required generating mappings to account for different operation and parameter orderings and, for generic components, automatic instantiation. The result was a tool which implements automated assistance for finding reusable components in a large software repository. Methods were developed for parameter and operator mapping, parameter type matching, and ensuring instantiation of a generic was possible. Upon receipt of a PSDL specification query, these methods are employed to automate the retrieval of all matching components and the integration of the selected component into the software prototype. This has been fully implemented for operator components and partially implemented for type components. The retrieval mechanism, a potential processing bottleneck, is extremely accurate and reasonably fast. A query on a 1,000 component repository retrieved all 50 possible matches in under three minutes. DTIC

APPLICATION OF DIGITAL VIDEO TO HYPERMEDIA TRAINING SYSTEMS Final Report, Jan. 1991 - Mar. 1993
Lee Lacy, Richard Braby, De Pass Smith, Mike Slaven, and Kevin Glass Nov. 1993 34 p
(Contract F33615-91-C-0003)
(AD-A274989; Rept-879.01.4; AL/HR-TR-1993-0132) Avail: CASI HC A03/MF A01

A research effort was conducted to analyze the potential for using autoauthoring training hypermedia in teaching students to perform procedures. In this effort, autoauthoring involved automating the creation of training material from a description of a procedure rather than using traditional methods such as flowcharting and programming. The Prototype Animated Training Hypermedia System (PATHS) was the computer program developed to perform this process. Sample applications were produced using PATHS, demonstrating the feasibility of this concept for procedural training. PATHS rapidly generates training hypermedia. A prototype, PATHS, needs further testing and development before it can become an operational system. DTIC

WEIGHTED AND UNWEIGHTED MAXIMUM CLIQUE ALGORITHMS WITH UPPER BOUNDS FROM FRACTIONAL COLORING
Egon Balas and Jue Xue Apr. 1993 23 p
(Contract N00014-85-K-0198; NSF DDM-92-01340)
(AD-A275328; MSRR-590) Avail: CASI HC A03/MF A01

The linear programming relaxation of the minimum vertex coloring problem, called the fractional coloring problem, is NP-hard. We describe efficient approximation procedures for both the weighted and unweighted versions of the problem. These fractional coloring procedures are then used for generating upper bounds for the (weighted or unweighted) maximum clique problem in the framework of a branch and bound procedure. Extensive computational testing shows that replacing the standard upper bounding procedures based on various integer coloring heuristics with the somewhat more expensive fractional coloring procedure results in improvements of the bound by up to one fourth in the unweighted and up to one fifth in the weighted case, accompanied by a decrease in the size of the search tree by a factor of almost two. INTELLIGENT AUTOMATED PROCESS PLANNING AND CODE GENERATION FOR COMPUTER-CONTROLLED INSPECTION Final Report, Aug. 1991 - Jan. 1993
Steven M. Ruegsegger Jan. 1994 149 p
(Contract F33615-87-C-5250)
(AD-A275346; WL-TR-94-4002) Avail: CASI HC A07/MF A02

Requirements for greater precision and reduced rejection rates demand improved inspection methods that can be provided by implementing increased automation into the process. This thesis discusses the implementation of an automated intelligent inspection planner and its integration into a feature-based concurrent engineering system. The approach utilizes features as the common language of the individual modules that promote ideas of geometry, functionality, and design intent throughout the system by feature translation among the modules. An artificial neural network optimizes the sequence of inspection points based on inspection rule criteria. A collision avoidance algorithm ensures the safety of automated inspection in a computationally efficient manner. The goal of the inspection planner is to output instruction code that will be executed on a computer-controlled

coordinate measurement machine (CMM) to properly, efficiently, and safely measure and evaluate the tolerances of the manufactured product. DTIC

TINKERTOY(TM) TRANSACTIONS

Nicholas Haines, Darrell Kindred, J. G. Morrisett, Scott M. Nettles, and Jeannette M. Wing Dec. 1993 20 p

(Contract F33615-93-1-1330)

(AD-A275271; CMU-CS-93-202) Avail: CASI HC A03/MF A01

This document describes the design of a transaction facility for a language that supports higher-order functions. We factor transactions into four separable features: persistence, undoability, locking, and threads. Then, relying on function composition, we show how we can put them together again. Our 'Tinkertoy' approach towards building transactions enables us to construct a model of concurrent, nested, multi-threaded transactions, as well as other non-traditional models where not all natures of transactions are present. Key to our approach is the use of higher-order functions to make transactions first-class. Not only do we get clean composability of transactional features, but also we avoid the need to introduce special control and block-structured constructs as done in more traditional transactional systems. We implemented our design in Standard ML of New Jersey. DTIC

ADVANCED LANGUAGES FOR SYSTEMS SOFTWARE

Robert Harper and Peter Lee Jan. 1994 27 p

(Contract F19628-91-C-0168; ARPA Order 8313)

(AD-A275272; CMU-CS-94-104) Avail: CASI HC A03/MF A01

It has been amply demonstrated in recent years that careful attention to the structure of systems software can lead to greater flexibility, reliability, and ease of implementation, without incurring an undue penalty in performance. It is our contention that advanced programming languages-particularly languages with a mathematically rigorous semantics, and featuring higher-order functions, polymorphic types, first-class continuations, and a useful and powerful module system-are ideally suited to expressing such structure. Indeed, our previous research has shown that the use of an advanced programming language can have a fundamental effect on system design, leading naturally to system architectures that are highly modular, efficient, and allow re-use of code. We are thus working to demonstrate the viability and benefits of advanced languages for programming real-world systems. To achieve this, we have organized our research into the three areas of language design, compiler technology, and systems building. This report describes the current plans for this effort, which we refer to as the Fox project. DTIC

WINDOW 4.0: DOCUMENTATION OF CALCULATION PROCEDURES

E. U. Finlayson, D. K. Arasteh, C. Huizenga, M. D. Rubin, and M. S. Reilly Jul. 1993 45 p

(Contract DE-AC03-76SF-00098)

(DE94-004935; LBL-33943; TA-309) Avail: CASI HC A03/MF A01

WINDOW 4.0 is a publicly available IBM PC compatible computer program developed by the Building Technologies Group at the Lawrence Berkeley Laboratory for calculating the thermal and optical properties necessary for heat transfer analyses of fenestration products. This report explains the calculation methods used in WINDOW 4.0 and is meant as a tool for those interested in understanding the procedures contained in WINDOW 4.0. All the calculations are discussed in the International System of units (SI). WINDOW 4.0 is the latest in a series of programs released by the Lawrence Berkeley Laboratory. The WINDOW program has its roots in a paper detailing a method for calculating heat transfer through windows. WINDOW 4.0 replaces the widely used 3.1 version. Although WINDOW 4.0 is a major revision, many of the algorithms used in WINDOW 4.0 build upon those previously documented. This report documents the calculations that are unchanged from WINDOW 3.1, as well as those calculations that are new to WINDOW 4.0. This report uses the organization of the WINDOW 4.0 program. Results displayed on a WINDOW 4.0 screen are discussed in a section describing that screen. In the conclusion the aspects of the calculation method currently slated for revision are discussed. A glossary of variables used throughout the report is found in Section 11. DOE

REFERENCE MODEL FOR PROJECT SUPPORT ENVIRONMENTS, VERSION 2.0 Final Report

Alan Brown, David Carney, Patricia Oberndorf, and Marvin Zelkowitz Nov. 1993 125 p

(Contract F19628-90-C-0003)

(AD-A275191; CMU/SEI-93-TR-23; ESC-TR-93-199) Avail: CASI HC A06/MF A02

The U.S. Navy has embarked on the next Generation Computer Resources (NGCR) program to fulfill its need for standard computing resources. The program revolves around the selection of interface standards in six areas. The interface standards will be based on existing industry standards with multi-vendor support. The objective is to restructure the Navy's approach to take better advantage of commercial advances and to reduce cost and duplication of computer resources. This document is part of the NGCR program. DTIC

FINANCIAL RESOURCE REVIEW MODEL USER'S GUIDE

Dec. 1993 44 p

(Contract DAAK70-92-D-0003)

(AD-A274979) Avail: CASI HC A03/MF A01

The Belvoir Financial Resource Review Model (FRRM) was developed to provide an efficient means of assembling data for the zero quarter and quarterly execution year reviews and preparation of presentation graphics. In the zero quarter reviews, management is concerned with the spending plans for the upcoming year. In particular, they are looking at the plan for spending money outside the center (on contracts to industry and transfers to other government agencies), added to the plan for spending money in-house (on salaries and related internal costs). Taken together, these plans should match goals set for spending which have been established by AMC as targets. These goals are heavily front loaded. Since in-house costs tend to be uniform throughout the year, this implies that the external costs should be planned for early in the fiscal year. DTIC

A CONCURRENT, OBJECT-BASED IMPLEMENTATION FOR THE TACTICAL LEVEL OF THE RATIONAL BEHAVIOR MODEL M.S. Thesis

Frederick P. Thornton, Jr. Sep. 1993 142 p

(AD-A275024) Avail: CASI HC A07/MF A02

The middle, or Tactical, level of the Rational Behavior Model (RBM) is the essential bridge linking the top and bottom levels of the model together. To insure an autonomous vehicle maintains control and thus exhibits rational behavior during such time-consuming tasks as search, homing, and route replanning, the Tactical level must be able to handle concurrency. Until now, this level has been implemented in only a limited way using an object-oriented language and sequential operations. The objective of this thesis is to construct an implementation model that represents the concurrency inherent in the Tactical level within the framework of the design model already developed. The method for building this implementation is to use the Ada task construct for concurrency to represent the objects of the design model and their communication with each other. This research creates a Tactical level implementation in Ada for the NPS Autonomous Underwater Vehicle (AUV) simulator that successfully executes a mission scenario involving transit, search, task, and return phases and the same mission scenario with route replanning. This work thus provides a foundation for future development of concurrent implementations of this level of RBM. DTIC

HYPER-NPSNET: EMBEDDED MULTIMEDIA IN A 3D VIRTUAL WORLD M.S. Thesis

Charles P. Lombardo Sep. 1993 73 p

(AD-A275063) Avail: CASI HC A04/MF A01

As virtual world systems continue to evolve, the need exists to embed multimedia information into the world so users can query objects for additional information while maintaining frame rates greater than 15 frames per second. The need also exists for software tools to aid in the creation of multimedia

documents intended for virtual worlds. This thesis addresses the problems of how to attach/query multimedia information to/from 3D locations in a virtual world and the design of a Graphical User Interface (GUI) to facilitate the creation of multimedia documents. The method chosen is to attach the multimedia information files to fixed 3D locations called Anchors. The anchors can be queried by the user and the multimedia information retrieved. Through the same interface, users can create multimedia documents by creating and/or editing anchor properties. The approach used differs from previous work in that navigation through the virtual world is unconstrained and a variety of information types may be attached to a single anchor. With video running and fully interactive navigation underway, the implementation presented gives rendering performance greater than 15 frames per second for high-end graphics workstations. DTIC

MICROCOMPUTER-BASED PROTECTIVE FUNCTIONS IN INDUSTRIAL PRODUCTION SYSTEMS: ASSESSMENT METHOD

P. Bremer, A. Hallden, and J. Jacobson 1993 67 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0284-5172)
(PB94-137817; SP-RAPP-1993:51; ISBN-91-7848-437-5) Avail: CASI HC A04

An assessment method to verify adequate safety of microprocessor-based protective functions used in industrial production systems is presented. The assessment is divided into seven steps: identification, analysis on system level, functional testing, analysis below system level, testing below system level, environmental stress testing, and testing of user faults. Safety requirements and verification methods for microprocessor-based protective functions are introduced both on system level and below system level. Detailed measures are presented in appendices. They shall be used in addition to the commonly used requirements for safety devices based on conventional electronics without microprocessors. The described assessment method makes it possible to verify adequate safety for a microprocessor-based device to be used in safety critical applications according to the European standards draft prEN954-1 category 4 or 2. PROPAGATION OF EVIDENCE THROUGH FUZZY RULES Final Report

P. R. Kersten 1 Sep. 1993 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275071; NUWC-NPt-TR-10222) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Propagation of evidence through fuzzy rules is discussed and illustrated for three different certainty representations. The first certainty representation is single-valued using a real number to represent the certainty for both the premise and the conclusion. This single-valued representation is often found in fuzzy expert system shells. The second certainty representation is interval-valued and is useful in expert system applications. Finally, the third certainty representation is functional-valued and is the most general and the most complex. DTIC

Ada, OBJECT-ORIENTED TECHNIQUES, AND CONCURRENCY IN TEACHING DATA STRUCTURES AND FILE MANAGEMENT Final Report, 25 Sep. 1992 - 24 Sep. 1993

Henry G. Gordon 19 Nov. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAL03-92-G-0413)
(AD-A275385; ARO-30995.1-MA) Avail: CASI HC A02

This project examined the use of Ada in teaching Data Structures and File Management. The object-based features of Ada, its packaging mechanism, and its generic capabilities were used to develop reusable packages for a variety of data and file structures. These packages were used in software applications to illustrate software development for already existing code. Developed packages included singly and doubly-linked list; stacks; queues; general binary search trees; AVL-trees; directed, weighted graphs with traversal; random files; B-tree files; B+-tree files; and hash files. This is the third in a series of Naval Surface Warfare Center Dahlgren Division (NSWCDD) technical reports concerning software reliability. The first report, 'A Survey of Software Reliability Modeling and Estimation,' NSWC TR 82-171, discusses various approaches advocated for reliability estimation; reviews various models proposed for this estimation process; provides model assumptions, estimates of reliability, and the precision of those estimates; and provides the data required for the models' implementation. Eight software reliability models were selected to form the basis of a library. This library also contains data edit, transformation, general statistics, and Goodness-of-Fit functions. The original Statistical Modeling and Estimation of Reliability Functions for Software (SMERFS) Library was described in the SMERFS Library Access Guide, NSWC TR 84-371. The enhanced library, which now contains 11 models and model applicability analyses, is explained in NSWCDD TR 84-371, Revision 3. The execution of this more powerful library, through the new SMERFS driver, is explained herein. DTIC

(AD-A275342) Avail: CASI HC A03

The methods of classical denotational semantics provide a number of valuable tools to designers of sequential Algol-like programming languages. In particular, Algol-like languages can be described by recursive domain equations and semantic clauses. It is rather difficult to solve such equations from first principles. Fortunately for language designers, the metatheory of denotational semantics shows that every set of recursive domain equations has a solution. Indeed, the metatheory is so powerful that programming language designers can use the theory naively and be guaranteed that no foundational problems will arise. However, the theory that has been so successful for Algol-like languages is less appropriate for concurrency. The approach to language definition that seems most effective so far is structural operational semantics (SOS). To date, most uses of SOS for language definitions have been ad-hoc. We sketch the outlines of a metatheory of SOS's as used to define concurrent languages, and in particular the discipline of process algebras. DTIC

EMPIRICAL STUDIES OF THE VALUE OF ALGORITHM ANIMATION IN ALGORITHM UNDERSTANDING Ph.D. Thesis
Andrea W. Lawrence Aug. 1993 178 p
(AD-A275135) Avail: CASI HC A09/MF A02

A series of studies is presented using algorithm animation to teach computer algorithms. These studies are organized into three components: eliciting students' preferences, developing algorithm animation guidelines, and evaluating the effects of using algorithm animation in the classroom. Many systems for creating computer animations have been designed. These systems reflect the designers' confidence that visual representation is a valuable technique for conveying conceptual knowledge. Little formal experimentation has been carried out to determine whether such animations are beneficial in teaching the algorithms presented. Also, formal guidelines have not been developed for either design or use of these animations. This work addresses both concerns. Student preference for animation does not predict student performance on a post-test to measure learning. Several types of labeling (data, steps, actions) were examined and a variety of effects were found. One of these effects was that a text description of the algorithm increased accuracy on conceptual questions. Also, students are more accurate on a post-test if they are allowed to design their own data sets than if they use experimenter-defined data sets. Finally, use of the animations was evaluated in a classroom-type setting. All students were given a lecture on an algorithm. Adding a laboratory in which the subject controlled the animation and data sets led to more accurate performance than a lecture only or than a lecture with experimenter-preprepared data sets. This work has implications for the design and use of animated algorithms in teaching computer algorithms and for the design of laboratory experiences for beginning computer science courses. DTIC

After showing how the complexity of digital systems is doubling about every five years, and evoking the difficulties caused by this evolution, a methodological approach is described called the 'Systems Development Workshop' aiming to gain mastery of this evolution. Among design, production and validation stages, the importance of the design process is emphasized. The most acute problems of system development are generally described, and examples are given of the power and benefits that can be expected from computer design tools. System architecture design and functional specification are expanded somewhat, to show what benefits can be expected from an integrated approach. Through the SAO example, all development stages are evoked. A rough outline of the necessary capacities for a common work environment is drawn. Finally, it is noted that the increasing necessity of international cooperation in civil aviation consolidates the proposed approach. Author

The role played by numerical technologies has increased with each generation of flight control systems. Most of the functions of these systems are now assumed by integrated software and to industrialize the production of these software systems is rapidly becoming a necessity. The SFIM Industries have created a system which can successfully address each phase of the life cycle. Helicopter operating is intrinsically complex and any redundancy in the control systems increases this complexity. To create specifications for such systems is difficult but it is critical, as errors in specifications are often detected in the final phases of development, resulting in costly corrections. It is thus necessary to verify the precision and the justification of the specifications as early as possible. Within its Research and Development activities in avionics, SFIM evaluated the specifications' techniques in the cycle of complex systems' development. Several techniques have been studied (structural analysis, synchronized languages, expert systems) and two of them were tested in experiments. These techniques made it possible to create and validate some of the specifications, with varying degrees of success. The positive aspect of these techniques was clearly shown, they are significant elements in the cost management program of complex systems' software. Author

DESIGNING AND MAINTAINING DECISION-MAKING PROCESSES
Andrew Borden *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 6 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A02/MF A03

The design of the optimal strategy for decision making is intractably difficult when information sources (sensors) provide different amounts of information and have different costs associated with their use. This paper describes a sub-optimal design algorithm which can be further simplified if the user specifies some parts of the decision process to be executed at run-time. The design algorithm is provided with diagnostics so that the result can be compared with accuracy and response time requirements, and a learning module which enables new information to be incorporated into the knowledge base. The complexity of this algorithm is compared to that of the optimal design algorithm. Author

This paper is presenting a methodology for the integration of an expert system in an embedded real time software running the VRTX operating system. We define the 'Expert Unit' concept and its life cycle referring to a real experimentation. The production of operational embedded expert system becomes a reality because of the use of efficient tools and an original methodology for its integration. This paper is showing how software engineering techniques and methods (Life-Cycle definition, identification of generic configuration items) can help an embedded expert system development to be more efficient and controllable than by using the Boehm's spiral model. This Life-Cycle is compatible with military quality standards (GAM T17 and DOD 2167a). Derived from text

After the introduction of the RAFALE's Flight Command System (Systeme de Commande de Vol: SCV). DASSAULT Aviation presents its studies on software applications to critical safety systems, with an emphasis on the following: (1) The methodology used in the development. It includes a phase for the formalization of the software specifications, its objective being to improve on the dialogue between two distinct entities: the automaticians on one hand and the computer programmers on the other hand. (2) The key support systems used in this methodology: GISELE: specification tool using a formal language whose testing and automatic prototype potential guarantee a descriptive quality, and VALIRAF: validation tool which automatically compares the results of the system to the models obtained during the studies on specifications. It manages the testing process and evaluates its level of reliability. An assessment of the results and a presentation of future programs of study are also included.

OBJECT VERSUS FUNCTIONAL ORIENTED DESIGN
P. Occelli *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 9 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A02/MF A03

Since the early Eighties the Object Oriented approach to software system development was proposed as a possible solution of the so called 'software crisis'. The claimed benefits were that Object Oriented Design (OOD) had the potential to improve software quality by making possible a direct and natural correspondence between the real world and its model. Many variants of the original approach were proposed and the new trend was spread across the Software Engineering community. The 'traditional' functional oriented methods were suddenly considered out of date and not appropriate to support development of large real time systems. There were, of course, some drawbacks but they were always attributed to method immaturity and poor tool support, two self-solving problems as time passed. Ten years or more have gone since then and OOD methods have been widely adopted for the development of large distributed real time systems. Are the lessons learnt from such projects according to the expectations? Are Functional Oriented methods still able to support software projects of the size required by the Aerospace industry in the years leading to the 2000? This paper proposes a possible answer to these questions comparing the pro and cons of both methods. This comparison will be carried out on issues like transition from requirements to design and to Ada code, traceability from requirements to design, software safety, software maintainability, software testing and relationship with DOD-STD-2167.

The Air Force Avionics Laboratory has sponsored several efforts to increase the accuracy of aircraft navigation functions while decreasing crew workload through the application of intelligent systems. Two such efforts were the Adaptive Tactical Navigation (ATN) System and the Autonomous Fixtaking Management (AFM) system, which were both awarded to The Analytic Sciences Corporation (TASC). An intelligent system to aid the pilot with navigation functions was developed under the ATN program. This system incorporated real-time knowledge base software to manage the tactical navigation moding, fault tolerance, and pilot aiding to provide a robust navigation prototype for the next generation fighter aircraft. The ATN program highlighted the aircraft weapons officer's heavy workload associated with the location and identification of fixpoints to update and verify the accuracy of the navigation system. With this problem in mind, it was determined that an intelligent system was needed to automatically locate, image, and identify fixpoints and update the navigation solution. The AFM System was developed to prove the feasibility of automated navigation updates using tactical sensors and existing mission data processing systems. Several technologies developed under ATN were incorporated into the AFM system including a proven simulation of the navigation sensors, controllers, and mission planning and management software. Automation of human fix taking activity required integration of several emerging technologies including a real-time data fusion architecture, neural network and heuristic automatic recognition algorithms, and associative memories to retrieve fix points from on-board databases. Integration of these diverse technologies was simplified by the employment of an object-oriented software development approach and real-time control system. Derived from text

The Italian satellite (with a large Dutch contribution) SAX is a scientific satellite which has the mission to study roentgen sources. One main requirement for the Attitude and Orbit Control Subsystem (AOCS) is to achieve and maintain a stable pointing accuracy with a limit cycle of less than 90 arcsec during pointings of maximal 28 hours. The main SAX instrument, the Narrow Field Instrument, is highly sensitive to (indirect) radiation coming from the Sun. This sensitivity leads to another main requirement that under no circumstances the safe attitude domain may be left. The paper describes the application software in relation with the overall SAX AOCS subsystem, the CASE tools that have been used during the development, some advantages and disadvantages of the use of these tools, the measures taken to meet the more or less conflicting requirements of reliability and flexibility, and the lessons learned during development. The quality of the approach to the development has proven the (separately executed) hardware/software integration tests. During these tests, a neglectible number of software errors has been detected in the application software. Derived from text

EXPERIENCES WITH THE HOOD DESIGN METHOD ON AVIONICS SOFTWARE DEVELOPMENT

W. Mala and E. Grandi *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 12 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A03/MF A03

HOOD represents one of the most interesting approaches of the recent years to support an object oriented SW design for large embedded systems written in Ada. This paper reports about experiences gained by the authors in the context of a current large European avionic development project, where the Ada SW design has been performed using HOOD Version 3.0. A simplified example describes the approach taken in the project for SW architectural design. A critical evaluation of the HOOD method follows, where advantages and disadvantages are discussed and some hints are given to overcome some identified weak areas. The paper concludes with the recognition of HOOD as a promising approach and encourages further discussion to remove the weak areas. Derived from text

SOFTWARE ENGINEERING METHODS IN THE HERMES ON-BOARD SOFTWARE

Philippe Lacan and Paolo Colangeli *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 12 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A03/MF A03

The HERMES On-board Software is executed in a complex multi-processor environment composed of two segregated computers pools. It provides all services to control the trajectory and the attitude of the space plane and its configuration. It also provides aids to the On-board Crew and the Ground Facilities in the Mission and Space Vehicle management. Being highly 'Safety Critical', the attitude control functions are foreseen to be supported by a quad-computers pool in hot redundancy, running in parallel and tightly synchronized. To support 'Mission Critical' functions, as mission and vehicle management, a dual-computers pool in cold redundancy is the baseline. This paper describes how the use of HOOD methodology has been experienced in the HERMES On-board Software Mock-Up framework, from now onwards designated for the sake of brevity as MU. In this technical survey of MU, a number of figures characterizing application size, specification and design complexity of the developed software along with a technical balance of the experienced methods are given. REACTIVE SYSTEM SOFTWARE CONCEPT WITH AUTOMATION USING THE LDS LANGUAGE [CONCEPTION LOGICIELLE DE SYSTEME REACTIF AVEC UNE METHODOLOGIE D'AUTOMATES UTILISANT LE LANGAGE LDS]

J. J. Bosc *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 7 p In FRENCH (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A02/MF A03

The phase of conception of a reactive system is the most important step, as the paths that are chosen will only be validated when the software is integrated with the material and when the real time conditions are tested and verified. Thus, a very strict method has to be adopted, which takes into account the specifics of the problems to be solved. The question is to assess how far the LDS language can be taken and what associated coding techniques can be used. Transl. by FLS

This paper provides an overview of the Artificial Intelligence (AI) Program at Rome Laboratory. The three major thrusts of the program are described. The Knowledge-Based Planning Program seeks to develop the next generation of AI planning and scheduling tools. The engineering of knowledge-based systems focuses on the development and demonstration of technology to support large-scale, real-time systems of knowledge-based components. The knowledge-based software assistant program seeks to develop a new programming paradigm in which the full life-cycle of software activities are machine mediated. Author (revised)

Nerviano Plant is mainly involved in the development of complex avionic systems, of which software is essential component, often presenting safety critical features. The traditional techniques and methods imposed to support them with additional refinement tools to build the product safety during developing phases are inadequate. The paper describes a methodological approach for the systematic identification and classification of the effects caused by potential software failures. The potential software failures are identified evaluating the effects that would be produced by incorrect outputs on the other software parts and on the external environment. Furthermore, the proposed approach allows us to evaluate the necessity of introducing fault tolerance, recovery and backup procedures, and to define the adequate quantity and typology of testing and quality activities. ROME LABORATORY SOFTWARE ENGINEERING TECHNOLOGY PROGRAM

Elizabeth S. Kean *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 7 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A02/MF A03

This paper highlights the technology recently developed or under development in the US Air Force's Rome Laboratory Software Engineering Technology Branch. This program is generic in nature and is focused around the development and support of large, mission critical and embedded software systems, and thus, is very relevant to the development and support of avionics systems. Further, when a technology is programming language sensitive or a demonstration vehicle requires selection of a specific language, the program language selected is always Ada. Finally, this program has four major thrusts. One thrust emphasizes system definition technology and is concerned with development and validation of requirements and specifications. A second thrust explores and builds technology for integrated software and system engineering environments, with emphasis on tools, process support and enforcement, and support to development and acquisition managers. New explorations in this area include certification methodologies and tools for reusable software components, and software fault-tolerance (robustness). A third thrust deals with the specification, prediction, and assessment of software quality. Rome Lab has a framework for dealing with all aspects of software quality that has proven itself in Japan. The newest thrust is on software engineering for high performance computing. This unique program is evaluating and developing generic software methods and tools for using high performance, massively parallel computers in embedded and other mission critical applications.

A COMMON Ada RUN-TIME SYSTEM FOR AVIONICS SOFTWARE **c06**

Clive L. Benjamin, Marc J. Pitarys, Eliezer N. Solomon, and Steve Sedrel *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 11 p (For primary document see N94-29315 08-61)

The United States Air Force (USAF) requires the use of the Ada programming language in the development of new weapon system software. Each Ada compilation system uses a Run-Time System (RTS) for executive services such as tasking, memory management, and system initialization. Implementing and using custom RTS services in each software development activity inhibits avionics software reuse and portability. In addition, the USAF must support many Ada compilers over the operational life of the

weapon system. Finally, extensive testing and knowledge is required for each RTS. In 1990 the USAF began defining a Common Ada Run-Time System (CARTS) for real-time avionics applications. A contract was awarded to Westinghouse Electric Corporation (WEC) with subcontracts issued to compiler vendors DDC-I, Inc. and Tartan, Inc. A specification for the CARTS was completed in 1991 and coding of selected CARTS features was undertaken. The specification defined common interfaces between the application software and the RTS, and between the Ada compiler and the RTS. Incremental coding of the CARTS prototype is being done by DDC-I for the MIPS R3000 processor, and by Tartan for the Intel 80960 MC processor. Several prototypes have been developed and tested. This paper covers the significant CARTS features and services offered to avionics software engineers. The paper provides the results of performance testing of the CARTS features. Finally, this paper provides information on the appropriate use of the CARTS by avionics software engineers.

Ada RUN TIME SYSTEM CERTIFICATION FOR AVIONICS APPLICATIONS **c06**

Jacques Brygier and Marc Richard-Foy *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 9 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A02/MF A03

The certification procedures apply to a fully developed system including both hardware and software components. The issue is that the equipment supplier must integrate various components coming from separate sources. In particular, the Ada Run Time System is embedded in the equipment like any other application component. This leads to two major requirements: the Ada Run Time System must be a glass box, and unused run-time services must be eliminated from the embedded components. The first requirement comes from the civil aviation procedures DO 178A, and the second is a consequence of the need to proof the system. This can lead to the elimination of some unpredictable or unsafe Ada language features. The criticality of the system consists of three levels: critical, essential, and non-essential. The report ARINC 613 (from the Airlines Electronic Engineering Committee) surveys the Ada language and provides a list of features not to be used in avionics embedded software, at least for the first two levels.

DESIGN OF A THINWIRE REAL-TIME MULTIPROCESSOR OPERATING SYSTEM **c62**

Charles Gauthier *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 11 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A03/MF A03

As more and more capabilities are added to avionics and other real-time or embedded systems, it becomes necessary to increase the processing power of the underlying executors. At any point, technology imposes limits on the available performance of individual processors. Increasing the computing power beyond those limits requires the use of multiple processors. This paper presents an implementation of a multiprocessor multitasking real-time operating system on difficult architectures. The development of applications on this operating system does not require any special software development tools such as special compilers. Furthermore, the applications can be ported to a very wide range of multiprocessor architectures. The principles of operation of the operating system can be applied to the implementation of an Ada runtime environment, if some restrictions are observed.

ON GROUND SYSTEM INTEGRATION AND TESTING: A MODERN APPROACH **c06**

B. DiGiandomenico *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 7 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A02/MF A03

Modern aircraft, military or civil, incorporate the most up-to-date technology from all fields of research and development. There is an increasing tendency to develop digital control systems to replace analog control systems in all areas: engine control, power generation, fuel control, and environmental control. Digital systems are felt to be irreplaceable in avionics, and they are quickly approaching this level in flight control systems. Indeed, digital systems are responsible for the increased sophistication of modern aircraft and for the success of avionics as it now exists. The net result is that, while in the first generation of jet planes there were no onboard computers, modern aircraft may have more than twenty--with single or multiple 32 bit microprocessors, multiple megabytes of RAM, and sophisticated real time operating systems.

SOFTWARE TESTING PRACTICES AND THEIR EVOLUTION FOR THE 1990'S

Patrizia DiCarlo *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 9 p (For primary document see N94-29315 08-61)

Copyright Avail: CASI HC A02/MF A03

The experiences of an aerospace company in solving specific problems associated with the host testing of embedded software is described. Operational applicability and exploitation of off-the-shelf tools, solutions for the management of both process and testing information, and the impact of the possible use of formal methods for the automatic generation of test cases are investigated and assessed from the user's point of view. The driving topics are the analysis of the effects of the assessed solutions on the current working practices together with their transfer to operational divisions.

As avionics software complexity increases, traditional techniques for avionics software validation and testing become time consuming, expensive, and ultimately unworkable. New test issues arise with the development and maintenance of complex 'super federated' systems like that of the B-2 and highly integrated systems like that of the F-22. Upgrades to existing weapon systems that produce a blend of federated and integrated architectures further complicate the problem. This paper discusses the limitations of current approaches, equipment, and software. It defines a next generation of avionics software validation and test procedures, along with the hardware and software components that are required to make the process work. The central goals of the process and components are to reduce development and maintenance costs, to minimize womanpower requirements, to decrease the time required to perform the testing, and to insure the quality of the final product. The process is composed of unit test, component test, configuration item test, subsystem test, integration test, avionics-system test, and weapon-system test. Some of the topics covered are as follows: automated testing of avionics software, real-time monitoring of avionics equipment, nonreal-time and real-time avionics emulation, and real-time simulation. This paper is based upon several years of experience in the following areas: (1) research and development of new technologies to improve the supportability of weapon-system software; and (2) design and implementation of facilities for the development, enhancement, and test of avionics software.

The ability to accurately test a system is a highly desirable feature in the engineering design process. The ability to model your system's environment and to exercise your system, in that environment, is also highly desirable. Operational Flight Programs are the software programs of avionics embedded computer systems. Not only is it desirable to be able to test and model Operational Flight Programs, it is essential. The consequences of not performing accurate Operational Flight Program testing

can be devastating. Some of these include premature weapons release, erroneous flight instrument displays, and complete system failure. In order to test Operational Flight Programs, there are several things one must know about the Operational Flight Program, its weapons system host, its support environment, and how to generate and perform its test. This paper will address these issues as it develops a strategy to test an Operational Flight Program. Author (revised)

INTEGRATED FORMAL VERIFICATION AND VALIDATION OF SAFETY CRITICAL SOFTWARE
N. J. Ward *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 11 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A03/MF A03

Embedded software providing the functionality for a flight vehicle self destruct system was judged to be safety critical and required the highest level of assurance in its correctness. In order to achieve this a program of independent verification and validation was initiated which involved the definition of a formal specification of the software combined with static analysis and dynamic testing. The formal specification, written in an Object Oriented form of Z, was used to clarify the requirements and to provide a definition against which the code could be formally verified. A range of static analyses were performed culminating in Compliance analysis which effectively provided a proof of the code against low level mathematical specifications that were refined down from the Z specification. The dynamic test sets were chosen partly from the requirements specification and partly from the static analysis results so that complete path coverage through every module was achieved. The work revealed a number of errors within the code and its specifications, which were corrected. Through its rigor and the identification of errors, the analysis has given a very high degree of confidence in the correctness of the software. Author (revised)

THE UNICON APPROACH TO THROUGH-LIFE SUPPORT AND EVOLUTION OF SOFTWARE-INTENSIVE SYSTEMS
Donald Nairn *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 11 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A03/MF A03

A new approach is presented to the through-life support and evolution of software-intensive systems. The new approach involves a sequence of development contractors. The problems addressed have to do with the avoidance of a 'through-life dependency' on any of the development contractors, and of achieving a unified engineering system description without imposing undue restrictions on the use of evolving software methodologies. The UNICON approach is to vest the through-life continuity in a unified engineering description held in a new type of Project Support Database. This scheme now views the development contractors as having a 'jobbing' role. The technical feasibility of this approach was held to depend on achieving a much more complete engineering description--from the Statement of Requirement, through to the mapping of the software onto the hardware (variants)--than any yet available. This led to the development of the UNICON system description language, based on extensions to the familiar ENTITY/RELATION/ATTRIBUTE notation. Details are presented of a reverse engineering experiment. Author (revised)

A GENERALIZATION OF THE SOFTWARE ENGINEERING MATURITY MODEL
Karl G. Brammer and James H. Brill *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 9 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A02/MF A03

The software process consists of the methods, practices, and tools used to generate a software product. The Software Engineering Institute at Carnegie Mellon University has developed a capability maturity model (CMM) which defines five levels of maturity for the software process. Also included are sets of criteria that allow the specific assessment of actual software engineering maturity in given projects or organizations. In aerospace projects, software engineering very often is coupled with or embedded in systems engineering. It is therefore desirable to know if and how the CMM can be extended to systems engineering. The paper shows that this approach is feasible. After a brief summary of the original capability maturity model, an overview and comparison of software and systems engineering disciplines is provided. Differences between software and systems engineering are highlighted and modifications are proposed to adapt and generalize the CMM accordingly. Finally, the framework for a systems engineering maturity model is presented. This model is intended as a reference scale for systems engineering capability, in a similar way as the CMM applies to the software process. Author (revised)

APPLICATION OF INFORMATION MANAGEMENT METHODOLOGIES FOR PROJECT QUALITY IMPROVEMENT IN A CHANGING ENVIRONMENT **c82**
Fabrizio Sandrelli *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 6 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A02/MF A03

In the technologically advanced field of avionics, quality is required both by the market and the engineers. This means that quality is not only a goal to reach new customers, but is a different way of working which aims to reach a higher and more satisfactory working environment. The attention has been focused on the technical information produced during the development of the project and its diffusion through the technical and managerial environment. The goal is to improve the quality of the whole development process where the quality of the final products improves as a consequence. A methodology experienced in the last few years in ALENIA (Pomezia Plant) to plan, achieve, and manage a more flexible and advanced way of working, through the strong involvement of all who contribute to the realization of the product, is described. Attention was focused both on the organizational aspect of the project and the product configuration. These two aspects are self related and result in a correct management of the project. THE DISCIPLINE OF DEFINING THE SOFTWARE PRODUCT
John K. Bergey *In* AGARD, Aerospace Software Engineering for Advanced Systems Architectures Nov. 1993 13 p (For primary document see N94-29315 08-61)
Copyright Avail: CASI HC A03/MF A03

An initiative was undertaken to establish a de facto project standard for a 'software product' for mission critical computer resources (MCCR). This effort is an outgrowth of a risk reduction approach to improving the MCCR software development and acquisition process based on Deming's quality principles. While defining a 'software product' might appear to be rudimentary, the hypothesis is put forth that the software product itself, which has been inexplicably neglected by the software engineering community, is the key element and focal point for understanding and improving the software development and acquisition process. A model of a 'software product' is described that was developed to promote uniform software product nomenclature, serve as a reference point for software process improvement, provide a basis for developing a more cost-effective software documentation standard, and provide a more rigorous means of specifying software deliverables for MCCR. Other potential benefits of the software product model include providing a convenient and effective means to uniformly baseline diverse software products, establish software configuration management and control, ensure the capture of all software components required for regeneration, provide a natural mechanism for the collection of software product metrics, and facilitate the on-line sharing

and reuse of software programs, documents, and data. The software product model that has been developed is referred to as SPORE, which stands for software product organization and enumeration. SPORE is a graphical, hierarchical model that provides a complete and logical decomposition and description of a software product for MCCR. Author (revised)

The studies conducted within the MODULOR project were centered on the necessary specifications for the creation of a modular parallel machine whose dynamics could be reconfigured. The software tools needed for reconfiguration during the development of parallel applications were also studied. The functional architectural reconfiguration was first considered, in view of automatically adapting the interconnective topology as efficiently as possible for a given application. Adding reconfiguration capabilities to the interconnective systems, in order to ensure a tolerance of the parallel architecture against processing systems failure, was treated in the second part of the study. The studies stress the importance of the complementary reconfiguring systems ('functional' and 'in case of failure') and define the architecture which guarantees the maximum efficiency in real time communications, in spite of the failure of some of the components of the system. ANIMATION TECHNIQUES IN BRL-CAD Final Report

Lee A. Butler and Christine Murdza Dec. 1993 39 p

(DA Proj. 1L1-62618-AH-80)

(AD-A275232; ARL-TR-313) Avail: CASI HC A03/MF A01

Complex model systems can be difficult to depict using static images. Some phenomena are not apparent when viewed at a single instance in time. Many such things become much clearer, easier to detect and

understand when they can be presented as moving, changing, evolving entities. For this reason, a set of tools have been created to help users generate motion picture sequences of systems modeled with BRL-CAD. Raytracing is a fundamental analysis and rendering technique within BRL-CAD. Most users of BRL-CAD are acquainted with the use of the program 'rt' for creating still images. A relative few understand how to utilize its capabilities for generating animation sequences or 'movies.' This paper introduces some of the tools and techniques available for creating animation sequences with 'rt.' A basic knowledge of BRL-CAD, the geometry editor 'mged' and image creation using 'rt' is assumed. DTIC

REDUNDANT DISK ARRAYS IN TRANSACTION PROCESSING SYSTEMS Ph.D. Thesis, 1993

Antoine Nagib Mourad 8 Feb. 1994 128 p

(Contract NAG1-613; N00014-91-J-1283)

(NASA-CR-195759; NAS 1.26:195759; UILU-ENG-94-2208; CRHC-94-07)

Avail: CASI HC A07/MF A02

We address various issues dealing with the use of disk arrays in transaction processing environments. We look at the problem of transaction undo recovery and propose a scheme for using the redundancy in disk arrays to support undo recovery. The scheme uses twin page storage for the parity information in the array. It speeds up transaction processing by eliminating the need for undo logging for most transactions. The use of redundant arrays of distributed disks to provide recovery from disasters as well as temporary site failures and disk crashes is also studied. We investigate the problem of assigning the sites of a distributed storage system to redundant arrays in such a way that a cost of maintaining the redundant parity information is minimized. Heuristic algorithms for solving the site partitioning problem are proposed and their performance is evaluated using simulation. We also develop a heuristic for which an upper bound on the deviation from the optimal solution can be established. Author

Object-oriented programming has shown to be a suitable paradigm for implementing a wide variety of systems. The concepts of encapsulation and inheritance are powerful and useful features, providing flexibility in an understandable and extensible framework. Most object-oriented programming languages, however, are complicated; in providing these features, they present a bewildering array of mechanisms for describing programs, such as classes, metaclasses, methods, class variables, and various control structures. Even more importantly, object-oriented languages do not provide explicit support for maintaining the consistency of internal object states; it is up to the programmer to code methods that respect an implicit set of consistency requirements for the object as a whole. This thesis presents a new model of programming, called constrained objects, in which algebraic constraints are used as a foundation for object-oriented programming. In this model, objects are encapsulated constraint systems that communicate with each other via a message-passing mechanism. Each object maintains a consistent state under perturbation from messages sent by other objects using a constraint satisfaction process. One object may inherit from another; the set of constraints from the first object is conjoined with the set of constraints from the second, and the subsequent satisfaction of the combined constraints ensures the semantic consistency of the derived object. (Rept-932-600-102; ETN-94-95481) Avail: CASI HC A02/MF A01

A finite element method based code (SUPFORM3), which was developed for modeling superplastic forming processes, is described. The purpose of the computer code is to provide an improved process control tool for aerospace industries. The mechanical description is based on the model of a membrane under plane stress for a material allowing isotropic strains. The Newton-Raphson calculation and the viscoplastic description law are used. The friction between the workpiece and the tool is taken into account and the pressure cycle is optimized. The simulation is carried out in three steps: data file generation, numerical calculation, and color graphic visualizations. The simulation is performed by using four titanium alloy circular sheets. ABC is an interactive programming language where both ease of learning and ease of use stood high amongst its principle design aims. The language is embedded in a dedicated environment that includes a structure based editor. To fit in with the design aims, the editor had to be easy to learn, demanding a small command set, and easy to use, demanding a powerful command set and strong support for the user in composing programs, without enforcing a computer science understanding of issues of syntax and the like. Some novel design rules have led to an interesting editor, where the user may enter and edit text either structurally or nonstructurally, without having to use different 'modes'. ESA

ANIMATORS AND ERROR REPORTERS FOR GENERATED PROGRAMMING ENVIRONMENTS

T. B. Dinesh and F. Tip Dec. 1992 100 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0169-118X)

(CWI-CS-R9253; ETN-94-95535) Copyright Avail: CASI HC A05

Animators and error reporters for generated programming environments are studied. An 'error reporter' is a tool for indicating the exact position of a type-error in the source text. An 'animator' visualizes program execution;

typically, it highlights the statement that is currently executing. Applications of both tools are mainly to be found in the areas of debugging and tutoring. Instead of explicitly extending language specifications with these facilities, it is claimed that error reporters and animators can be generated from existing specifications for type-checkers and interpreters with little effort; to this end, a simple pattern matching mechanism is used in conjunction with origin tracking, a generic tracing technique. The claim is discussed, and the limitations and deficiencies of origin tracking are investigated. The techniques are illustrated using an example language named CLaX, a Pascal relative. The full specifications of the CLaX syntax, type-checker and interpreter are included. ESA

FORMAL SPECIFICATION AND VERIFICATION OF REAL-TIME SEQUENTIAL CONTROL SYSTEMS
Armen Gabrielian 1994 12 p
(Contract N00014-93-C-0100)
(AD-A275776) Avail: CASI HC A03/MF A01

A variety of methods have been employed for specifying the behavior of sequential control systems that, e.g., can be implemented by programmable logic controllers (PLC's). In dealing with real-time issues, timed Petri nets and other popular formalisms provide limited capabilities with respect to both specification and analysis of behavior. At the same time, many of the formal methods that have been reported in the literature are not readily applicable to the area of sequential control. In this paper, we explore the application of a formal method for real-time systems based on hierarchical multi-state (HMS) machines to the specification and verification of sequential control systems. Verification in this context goes beyond simulation and testing by attempting to provide mathematical proofs for correctness of behavior with respect to general safety properties. HMS machines, which were originally introduced in 1988, consist of parallel and hierarchical automata in which multiple states are true and multiple transitions can fire simultaneously. The temporal behavior of an HMS machine is defined in terms of an interval-based temporal logic. Examples of applications of HMS machines to sequential control problems and an overview of verification approaches are presented. DTIC

NONLINEAR PCA: ALGORITHMS AND APPLICATIONS
E. Oja and J. Karhumen Sep. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-137544; ISBN-951-22-1716-3) Avail: CASI HC A03

Many neural approaches have lately been proposed for performing standard PCA (Principal Component Analysis) of the input data. PCA networks provide an optimal solution to some information processing problems, but their generality is limited by the linearity of the input-output mapping. Recently the present authors suggested a class of nonlinear PCA networks for more complex tasks, especially robust PCA, and showed how they are derived from constrained Hebbian learning. This work is reviewed here. Some of these networks have been successfully used for sinusoidal signal detection in colored noise. The algorithms are related to nonlinear statistical optimization criteria, which typically involve a nonlinear expansion of the input vector in terms of the neuron weight vectors. The nonlinearities implicitly take into account higher-order moments in computing the optimal solution. Another variation of the basic neural network is the nonlinear Minor Component Analysis (MCA) network, which can solve a robust least squares problem and can be applied to robust curve and surface fitting with good results. ENGINEERING SPECIFICATION EDITING TOOLS Final Report
John T. Oriel Dec. 1993 64 p
(AD-A275116; NAWCTSD-TR-93-022) Avail: CASI HC A04/MF A01

The techniques described are intended to help writers and reviewers of specifications identify weaknesses in their drafts more quickly, thoroughly, and accurately than in the past. There were two parts to the effort that went into their development. The first involved the 'knowledge-engineering' needed in order to learn more about what makes specifications good or bad, so that the computer might be programmed to flag significant sources of potential error. The second part was experimentation with software techniques for automating the examination process. It was centered around the development of a small-scale natural language parser intended for parsing sentences that are typical in training systems specifications and statements of work. Surprisingly, for such an important subject as it is, relatively little organized knowledge was found about how to write and edit specifications. Most of the material used was borrowed from other fields. DTIC

USING RDD-100 WITH CoRE. VERSION 01.00.03 Final Report
Richard A. Kirk and Haywood S. Osborne 19 Jan. 1994 90 p Prepared for Virginia Center of Excellance for Software Software Reuse and Technology Transfer, Herndon
(Contract MDA972-92-J-1018)
(AD-A275336; SPC-93099-CMC) Avail: CASI HC A05/MF A01

This technical report describes how to develop a specification of software requirements using the Software Productivity Consortium's CoRE software requirements method from a system requirements and design specification developed using Ascent Logic Corporation's RDD-100. Specifically, this report describes the transition from system design to software requirements analysis when: (1) RDD-100 has been used to create system requirements and design specifications, or: (2) the software requirements analysis activity is to be performed according to the CoRE method. RDD-100 is the implementation of the Requirements Driven Design (RDD) system design and engineering method, wherein the system design is driven by the customer's expectations of system behavior. CoRE is the Software Productivity Consortium's software requirements engineering method. Created to support the development of precise, testable specifications that are demonstrably complete and consistent. An RDD-100 system model contains all of the information needed to begin building a CoRE software requirements specification. DTIC

PERFORMANCE OF MCNP4A ON SEVEN COMPUTING PLATFORMS
J. S. Hendricks and R. C. Brockhoff 1994 6 p Presented at the 8th International Conference on Radiation Shielding, Arlington, TX, 24-27 Apr. 1994
(Contract W-7405-eng-36)
(DE93-040101; LA-UR-93-2968; CONF-940424-1) Avail: CASI HC A02/MF A01

The performance of seven computer platforms has been evaluated with the MCNP4A Monte Carlo radiation transport code. For the first time, we report timing results using MCNP4A and its new test set and libraries. Comparisons are made on platforms not available to us in previous MCNP timing studies. By using MCNP4A and its 325-problem test set, a widely-used and readily-available physics production code is used; the timing comparison is not limited to a single 'typical' problem, demonstrating the problem dependence of timing results; the results are reproducible at the more than 100 installations around the world using MCNP; comparison of performance of other computer platforms to the ones tested in this study is possible because we present raw data rather than normalized results; and a measure of the increase in performance of computer hardware and software over the past two years is possible. The computer platforms reported are the Cray-YMP 8/64, IBM RS/6000-560, Sun Sparc10, Sun Sparc2, HP/9000-735, 4 processor 100 MHz Silicon Graphics ONYX, and

Gateway 2000 model 4DX2-66V PC. In 1991 a timing study of MCNP4, the predecessor to MCNP4A, was conducted using ENDF/B-V cross-section libraries, which are export protected. The new study is based upon the new MCNP 25-problem test set which utilizes internationally available data. MCNP4A, its test problems and the test data library are available from the Radiation Shielding and Information Center in Oak Ridge, Tennessee, or from the NEA Data Bank in Saclay, France. Anyone with the same workstation and compiler can get the same test problem sets, the same library files, and the same MCNP4A code from RSIC or NEA and replicate our results. And, because we report raw data, comparison of the performance of other compute platforms and compilers can be made. DOE

EXTENDING THE X WINDOW SYSTEM
J. P. Brenkosh 23 Dec. 1993 58 p
(Contract DE-AC04-94AL-85000)
(DE94-006496; SAND-93-4100) Avail: CASI HC A04/MF A01

The X Window System was originally developed in 1984 at Massachusetts Institute of Technology. It provides client-server computing functionality and also facilitates the establishment of a distributed computing environment. Since its inception, the X Window System has undergone many enhancements. Despite these enhancements there will always be a functionality desired in the standard released version of X that is not supported or commercially or academically available. The developers of the X Window System have designed it in such a way that it is possible to add functionality that is not included in the standard release. This is called an extension. Extensions are one method used to develop a customized version of the X Window System to support a specialized application. This report presents the mechanics of adding an extension and examines a particular extension that was developed at Sandia National Laboratories to support data compression in X Windows which was one aspect of the Desktop Video and Collaborative Engineering Laboratory Directed Research and Development (LDRD). DESIGN FOR DEPENDABILITY: A SIMULATION-BASED APPROACH Ph.D. Thesis, 1993
Kumar K. Goswami 2 Feb. 1994 149 p
(Contract NAG1-613; N00014-91-J-1116)
(NASA-CR-195757; NAS 1.26:195757; UILU-ENG-94-2204; CRHC-94-03)
Copyright Avail: CASI HC A07/MF A02

This research addresses issues in simulation-based system level dependability analysis of fault-tolerant computer systems. The issues and difficulties of providing a general simulation-based approach for system level analysis are discussed and a methodology that address and tackle these issues is presented. The proposed methodology is designed to permit the study of a wide variety of architectures under various fault conditions. It permits detailed functional modeling of architectural features such as sparing policies, repair schemes, routing algorithms as well as other fault-tolerant mechanisms, and it allows the execution of actual application software. One key benefit of this approach is that the behavior of a system under faults does not have to be pre-defined as it is normally done. Instead, a system can be simulated in detail and injected with faults to determine its failure modes. The thesis describes how object-oriented design is used to incorporate this methodology into a general purpose design and fault injection package called DEPEND. A software model is presented that uses abstractions of application programs to study the behavior and effect of software on hardware faults in the early design stage when actual code is not available. Finally, an acceleration technique that combines hierarchical simulation, time acceleration algorithms and hybrid simulation to reduce simulation time is introduced. Author

SPACE RECLAMATION FOR UNCOORDINATED CHECKPOINTING IN MESSAGE-PASSING SYSTEMS Ph.D. Thesis
Yi-Min Wang 19 Nov. 1993 118 p
(Grant NAG1-613)
(NASA-CR-195761; NAS 1.26:195761; UILU-ENG-93-2251; CRHC-93-24)
Avail: CASI HC A06/MF A02

Checkpointing and rollback recovery are techniques that can provide efficient recovery from transient process failures. In a message-passing system, the rollback of a message sender may cause the rollback of the corresponding receiver, and the system needs to roll back to a consistent set of checkpoints called recovery line. If the processes are allowed to take uncoordinated checkpoints, the above rollback propagation may result in the domino effect which prevents recovery line progression. Traditionally, only obsolete checkpoints before the global recovery line can be discarded, and the necessary and sufficient condition for identifying all garbage checkpoints has remained an open problem. A necessary and sufficient condition for achieving optimal garbage collection is derived and it is proved that the number of useful checkpoints is bounded by $N(N+1)/2$, where N is the number of processes. The approach is based on the maximum-sized antichain model of consistent global checkpoints and the technique of recovery line transformation and decomposition. It is also shown that, for systems requiring message logging to record in-transit messages, the same approach can be used to achieve optimal message log reclamation. As a final topic, a unifying framework is described by considering checkpoint coordination and exploiting piecewise determinism as mechanisms for bounding rollback propagation, and the applicability of the optimal garbage collection algorithm to domino-free recovery protocols is demonstrated.

ANALYSIS OF EDP PERFORMANCE Final Report
4 Apr. 1994 30 p Revised
(Contract NAS2-13758)
(NASA-CR-195726; NAS 1.26:195726) Avail: CASI HC A03/MF A01

The objective of this contract was the investigation of the potential performance gains that would result from an upgrade of the Space Station Freedom (SSF) Data Management System (DMS) Embedded Data Processor (EDP) '386' design with the Intel Pentium (registered trade-mark of Intel Corp.) '586' microprocessor. The Pentium ('586') is the latest member of the industry standard Intel X86 family of CISC (Complex Instruction Set Computer) microprocessors. This contract was scheduled to run in parallel with an internal IBM Federal Systems Company (FSC) Internal Research and Development (IR&D) task that had the goal to generate a baseline flight design for an upgraded EDP using the Pentium. This final report summarizes the activities performed in support of Contract NAS2-13758. Our plan was to baseline performance analyses and measurements on the latest state-of-the-art commercially available Pentium processor, representative of the proposed space station design, and then phase to an IBM capital funded breadboard version of the flight design (if available from IR&D and Space Station work) for additional evaluation of results. Unfortunately, the phase-over to the flight design breadboard did not take place, since the IBM Data Management System (DMS) for the Space Station Freedom was terminated by NASA before the referenced capital funded EDP breadboard could be completed. The baseline performance analyses and measurements, however, were successfully completed, as planned, on the commercial Pentium hardware. The results of those analyses, evaluations, and measurements are presented in this final report.

COMPUTATIONAL METHODS FOR THE SHAPE SHADING PROBLEM Ph.D. Thesis
Paul M. Carter Jul. 1993 175 p
(ISBN-0-315-85430-8; CTN-94-61157) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Computational methods for the shape from shading problem as formulated through the image irradiance equation are explored. Three approaches are considered in developing robust, efficient methods and in testing the resulting algorithms on synthetic images. The first revises the method of characteristic strips with more stable integration schemes. Although the effects of noise are reduced, the solution is deemed unsatisfactory. The second approach considers Horn's variational technique as a basis for producing a fast solver. A discretization technique is devised and coupled with a special continuation multigrid method. Given multiple image data, excellent results are obtained even in the presence of discontinuities. The third approach examines a class of solution techniques based on fluid flow. A regularization of the generally ill-posed formulation is proposed and it is observed that the algorithm is prone to producing spurious results due to the non-random accumulation of errors in the computed solution. The variational method yields the most promising results of the three approaches considered. Efficient, good quality reconstructions are obtained, especially when data from more than one image are available. Author (CISTI)

ADDENDUM TO THE FINAL REPORT FOR THE INVESTIGATION OF PROOF TECHNIQUES WITHIN THE EVES VERIFICATION TECHNOLOGY
Mark Saaltink, Sentot Kromodimoeljo, and Bill Pase Dec. 1993 20 p
(TR-93-5451-03; CTN-94-61139) Copyright Avail: CASI HC A03/MF A01

An addendum is provided to work which investigated and experimented with various approaches for enhancing the capabilities of the theorem prover NEVER and the overall effectiveness of EVES, a software tool for the development of verified software. The addendum discusses two further tasks. The first is an improved understanding of how to use NEVER's forward chaining mechanisms to write complete rulesets, thereby, implementing decision procedures for various kinds of mathematical theories. In particular, based on ongoing work, it will record either a specific means for writing such procedures along with a mathematical justification for the approach, or the difficulties in achieving a general approach. The second task is an attempt to integrate the separate prototype Knuth-Bendix algorithm into EVES. The shortcomings of the present implementation are noted and several possible solutions are enumerated. A simple user interface to the algorithm was successfully completed, having a single command for initialization and execution. Example results are displayed. CISTI

AN INTERACTIVE, DESIGN AND EDUCATIONAL TOOL FOR SUPERSONIC EXTERNAL-COMPRESSION INLETS
Thomas J. Benson May 1994 15 p Proposed for presentation at the 30th Joint Propulsion Conference, Indianapolis, IN, 27-29 Jun. 1994; sponsored by AIAA, ASME, SAE, and ASEE
(RTOP 505-62-52)
(NASA-TM-106581; E-8841; NAS 1.15:106581) Avail: CASI HC A03/MF A01

A workstation-based interactive design tool called VU-INLET was developed for the inviscid flow in rectangular, supersonic, external-compression inlets. VU-INLET solves for the flow conditions from free stream, through the supersonic compression ramps, across the terminal normal shock region and the subsonic diffuser to the engine face. It calculates the shock locations, the capture streamtube, and the additive drag of the inlet. The inlet geometry can be modified using a graphical user interface and the new flow conditions recalculated interactively. Free stream conditions and engine airflow can also be interactively varied and off-design performance evaluated. Flow results from VU-INLET can be

saved to a file for a permanent record, and a series of help screens make the simulator easy to learn and use. This paper will detail the underlying assumptions of the models and the numerical methods used in the simulator. Author (revised)

AN INTERACTIVE EDUCATIONAL TOOL FOR COMPRESSIBLE AERODYNAMICS
Thomas J. Benson Apr. 1994 14 p
(RTOP 505-62-52)
(NASA-TM-106568; E-8768; NAS 1.15:106568) Avail: CASI HC A03/MF A01

A workstation-based interactive educational tool was developed to aid in the teaching of undergraduate compressible aerodynamics. The tool solves for the supersonic flow past a wedge using the equations found in NACA 1135. The student varies the geometry or flow conditions through a graphical user interface and the new conditions are calculated immediately. Various graphical formats present the variation of flow results to the student. One such format leads the student to the generation of some of the graphs found in NACA-1135. The tool includes interactive questions and answers to aid in both the use of the tool and to develop an understanding of some of the complexities of compressible aerodynamics. A series of help screens make the simulator easy to learn and use. This paper will detail the numerical methods used in the tool and describe how it can be used and modified. Author (revised)

COMMON SPACEBORNE MULTICOMPUTER OPERATING SYSTEM AND DEVELOPMENT ENVIRONMENT
L. G. Craymer, B. F. Lewis, P. J. Hayes, and R. L. Jones Feb. 1994 34 p
(RTOP 233-01-03)
(NASA-TM-109092; JPL-D-11525; NAS 1.15:109092) Avail: CASI HC A03/MF A01

A preliminary technical specification for a multicomputer operating system is developed. The operating system is targeted for spaceborne flight missions and provides a broad range of real-time functionality, dynamic remote code-patching capability, and system fault tolerance and long-term survivability features. Dataflow concepts are used for representing application algorithms. Functional features are included to ensure real-time predictability for a class of algorithms which require data-driven execution on an iterative steady state basis. The development environment supports the development of algorithm code, design of control parameters, performance analysis, simulation of real-time dataflow applications, and compiling and downloading of the resulting application. SOFTWARE ENGINEERING AND SOFTWARE MANAGEMENT IN A DISTRIBUTED UNIX ENVIRONMENT
S. deJong and E. H. Baalbergen 1 Apr. 1992 22 p Presented at the 4th ISNaS Symposium, Delft, Netherlands, 23-24 Apr. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NLR-TP-92233-U; ETN-94-95591) Avail: Issuing Activity (European Space Agency (ESA))

A method for software engineering and a software management environment that supports the method are described. The main features of the software engineering method include cooperation between specialists of various disciplines, separation of the user interface of a system from the rest of the system, and support for reuse of information. The main goals of the software management environment are to support the software engineering method and to use the network of computer systems (running the UNIX operating system) effectively. ESA

PARALLEL QUANTIFICATION
Martijn Spaan 22 Feb. 1993 27 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3307)
(LP-93-01; ETN-94-95559) Avail: CASI HC A03

Forms of paralliel quantification are investigated both from a linguistic and a logical point of view. In particular, interest is in finding a general branching definition. The natural language examples suggest strong connections between parallel and collective readings. In fact, confusion seems to exist between the two classes of readings. Following the intuitions of G. Sher's 'ways of branching quantifiers', the effects of various notions of maximality are investigated. In the logical treatment, starting from basic intuitions of globality and parallelism, various semantic principles that parallel definition schemes should satisfy are introduced. These strongly suggest that the three parallel definition schemes eventually found, are in fact the only ones. Notions concerning quantifiers that may be applicable to other parts of generalized quantifier theory as well are introduced throughout. ESA

Views is an open architecture application environment that offers a consistent user interface across applications, interoperability between them, much less programming to produce an application, and the ability to add and modify applications on the fly. The system kernel contains a user interface layer and a persistent data storage layer, so that applications only have to implement the true functionality. Objects contain no information on how they are to be displayed, so the presentation of documents can be changed easily, even on the fly. The main implementation technique is the use of invariants between objects which are automatically made two-way by the system. Aspects of programming for Views are described. ESA

The Views system is a computing environment currently under development. One of its many facets is a graphics facility enabling structured picture objects to be easily entered and manipulated. Such pictures can be included as illustrations in text, as icons in the user interface and ultimately as the specification of all the visible aspects of the system; menus, scroll-bars, windows and so on. Views graphics objects can also be linked to other Views objects with invariants, resulting in pictures that automatically react to changes within other parts of the system. The Views system is outlined, and some of the design and implementation issues of the graphics facilities are described. ESA

Views is a user interface system in which the user interface is a layer above the applications guaranteeing consistency of the interface. Additionally, the data layer implements external object representation allowing an exchange of objects between applications without loss of structure. Although Views offers an architecture to deal with user interface aspects on a high level, it is shown that low level interaction can be modeled with the architecture provided. ESA

(CWI-CS-R9262; ETN-94-95544) Copyright Avail: Issuing Activity (European Space Agency (ESA))

The Views system is an open application integration environment in which the data layer and user interface layer are supplied by the system. Objects in this environment can be linked through invariants; when the value of either of the objects changes, the other is updated to match the invariant. The invariant mechanism is also used for the presentations of objects on screen. If an object changes, the presentation is updated. Additonally, the inverse is true: if the presentation changes, for example by an edit action, the structure of the object should be updated incrementally to match the presentation. An incremental implementation of some functional list operators (map, reduce, filter) is presented, and using these operators, a general parsing algorithm is described. The resulting parser is therefore automatically incremental, without any attention being paid to incrementality in the algorithm. ESA

THE BEAUTY AND THE BEAST
Peter Achten and Rinus Plasmeijer Mar. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-93-03; ETN-94-95622) Avail: CASI HC A03

A method for programming window-based I/O (Input/Output) in a pure functional language is presented. This method enables the programmer to specify interactions at a very high level of abstraction. It employs a machine independent declarative specification of devices such as windows, dialogues and menus. These devices are specified via predefined algebraic data types containing event handlers (user defined higher order functions). All low level handling is hidden from the programmer. The event stream is handled by a library function that takes the algebraic specification of the devices and applies recursively the appropriate event handler for each event. The system is implemented for the lazy functional language Concurrent Clean. It was used successfully for the implementation of large interactive applications such as a window based editor and a relational database. Due to the use of uniqueness types (that make it possible to define functions that perform updates without violating the functional semantics) applications run as efficiently as their imperative counterparts: they can be actually used in practice. The presented method is felt to turn I/O handling into one of the strengths of functional languages. ESA

INCREASING THE APPLICABILITY OF LR PARSING
Mark-Jan Nederhof and Janos J. Sarbo Mar. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NWO-00-62-518)
(TR-93-06; ETN-94-95623) Avail: CASI HC A03

A phenomenon present in some context free grammars, called 'hidden left recursion', is described. It is shown that ordinary LR (Left Right) parsing according to hidden left recursive grammars is not possible, and a range of solutions to this problem are indicated. One of these solutions proposes a new parsing technique, which is a variant of traditional LR parsing. This parsing technique can be used both with and without lookahead and also to define a variant of Tomita parsing. A derivation of the parsing technique is shown and the static space requirements are discussed. ESA

A CONCEPTUAL LANGUAGE FOR THE DESCRIPTION AND MANIPULATION OF COMPLEX INFORMATION MODELS
A. H. M. terHofstede (Utrecht State Univ., Netherlands.), H. A. Proper, and T. P. vanderWeide Dec. 1992 15 p Sponsored by Software Engineering Research Centre; and Netherlands Organization for Scientific Research
(TR-92-34; ETN-94-95619) Avail: CASI HC A03/MF A01

Conceptual data modeling techniques aim at the representation of data at a high level of abstraction. This implies that conceptual data modeling techniques should not only be capable of naturally representing complex structures, but also the rules (constraints) that must hold for these structures. Contemporary data modeling techniques however, do not provide a language, which on the one hand has a formal semantics and on the other hand leads to natural looking expressions, for formulating these constraints. An informal introduction to such a language (LISA-D) for the data modeling technique (PSM (Predicator Set Model)), is presented. PSM is a generalization of object-role models (such as ER and NIAM). The semantics of LISA-D are discussed. ESA

TWO ALGORITHMS FOR FINDING RECTANGULAR DUALS OF PLANAR GRAPHS
Goos Kant and Xin He Dec. 1992 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract EC-7141; NSF CCR-90-11214) (ISSN 0924-3275)
(RUU-CS-92-41; ETN-94-95631) Avail: CASI HC A03

Two linear time algorithms for computing a regular edge labeling of 4-connected planar triangular graphs are presented. This labeling is used to compute in linear time a rectangular dual of this class of planar graphs. The two algorithms are based on totally different frameworks, and both are conceptually simpler than the previous known algorithm and are of independent interests. The first algorithm is based on edge contraction. The second algorithm is based on the canonical ordering. This ordering

can also be used to compute more compact visibility representations for this class of planar graphs. ESA

ON BLOCKS: LOCALITY AND ASYNCHRONOUS COMMUNICATION (EXTENDED ABSTRACT)

F. S. deBoer (Technische Univ., Eindhoven, Netherlands.), J. N. Kok, C. Palamidessi, and J. J. M. M. Rutten Dec. 1992 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-92-44; ETN-94-95634) Avail: CASI HC A03

A general construct for locality in languages based on asynchronous communication is introduced. The construct allows a uniform semantic description of such seemingly different notions of locality as the hiding of local variables in imperative shared variable languages and the existantial quantification of logical variables in concurrent constraint languages. The compositional model is fully abstract with respect to the operational one. ESA

A DETERMINISTIC ALGORITHM FOR THE THREE-DIMENSIONAL DIAMETER PROBLEM

Jiri Matousek and Otfried Schwarzkopf Dec. 1992 13 p Sponsored in part by Netherlands Organization for Scientific Research; EEC; and Alexander von Humboldt Foundation Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-92-45; ETN-94-95635) Avail: CASI HC A03

The following problem is considered: given an n point set P in three dimensional space, compute its diameter diam(P), defined as the maximum distance between a pair of points in P. This problem was solved by Clarkson and Shor by a randomized algorithm with optimal expected running time O(n log n). However, it seems quite difficult to construct a deterministic algorithm with a comparable asymptotic efficiency. Chazelle et al. applied Megiddo's parametric search in connection with the Clarkson-Shor algorithm and further techniques and obtained a deterministic O(n(sup 1 + epsilon)) algorithm, where epsilon greater than 0 is an arbitrarily small constant. This study improves this running time to O(n polylog n), where polylog n is used as a generic notation for a function of the form (log n)(sup c), c greater than 0 a constant). ESA

LOGIC OF TRANSITION SYSTEMS

Johan vanBenthem and Jan Bergstra Mar. 1993 40 p

(ISSN 0928-3323)

(CT-93-03; ETN-94-95557) Avail: CASI HC A03/MF A01

A study which shows how labeled transition systems, which are key structures for modeling computation, lend themselves to ordinary logical analysis (without any special new formalisms), by introducing their standard first order theory, is presented. This perspective enables several basic model theoretic questions of definability, axiomatization and preservation for various notions of process equivalence found in the computational literature to be raised, and answered using well known logical techniques (including the Compactness theorem, Saturation and Ehrenfeucht games). Consideration is given as to what happens to this general theory when attention is restricted to special classes of transition systems (in particular, finite ones), as well as extended logical languages (in particular, infinitary first order logic). It is hoped that this puts standard logical formalisms on the map as a serious option for a theory of computational processes. As a side benefit, the approach increases comparability with several other existing formalisms over labeled transition systems (such as process algebra or modal logic). Pointers to this effect are provided. ESA

SELF-STABILIZING l-EXCLUSION ALGORITHMS

Mitchell Flatebo (Nevada Univ., Las Vegas.), Ajoy Kumar Datta (Nevada Univ., Las Vegas.), and Anneke A. Schoone Jan. 1993 25 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract NF-62-376) (ISSN 0924-3275)

(RUU-CS-93-01; ETN-94-95638) Avail: CASI HC A03

A distributed system consists of a set of loosely connected machines that do not share a global memory. The system is self stabilizing if it can be started in any global state and achieves its consistency all by itself. This also means that the system can deal with infrequent errors. Self stabilizing l-exclusion algorithms are presented. The l-exclusion problem is a generalization of the mutual exclusion problem (where l = 1). The algorithms presented are generalizations of a self stabilizing mutual exclusion algorithm by Dijkstra. The first algorithm serves to illustrate the underlying ideas but uses unbounded numbers. The second algorithm is adapted to the use of bounded numbers, while the third algorithm overcomes a disadvantage of the first two algorithms. ESA

THE VANILLA META-INTERPRETER FOR DEFINITE LOGIC PROGRAMS AND AMBIVALENT SYNTAX

Marianne Kalsbeek Jan. 1993 25 p Sponsored by Netherlands Organization for Scientific Research

(ISSN 0928-3323)

(CT-93-01; ETN-94-95555) Avail: CASI HC A03/MF A01

Syntax and semantics for the Vanilla meta-interpreter are presented. The Vanilla meta-interpreter is a definite logic program which consists of two parts: a general part consisting of an intensional formalization of derivability by SLD resolution from definite object programs; an object program specific part consisting of a metalevel description of the clauses of an object program. Ambivalent syntax, which is characterized by the occurrence of formulas as terms, is discussed, and a suitable semantics is provided. Ambivalent syntax is shown to be appropriate for the Vanilla meta-interpreter. Correctness of the Vanilla meta-interpreter is proved for definite programs. ESA

FAST AND EFFICIENT VARIABLE-TO-FIXED-LENGTH CODING ALGORITHM

T. Algra 27 Aug. 1992 12 p Repr. from Electronics Letters, v. 28, no. 15, 16 Jul. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-125465; NLR-TP-92353-U; ETN-94-95593) Avail: Issuing Activity (European Space Agency (ESA))

Variable to fixed length coding implementations, according to the algorithm of Tunstall, are shown to be significantly less complex than fixed to variable length coding schemes such as the Huffman scheme. In a variable to fixed length coding situation, the encoder chops the source outputs sequence into segments of about the same probability. To inform the decoder, the encoder sends it the lexicographical index of the segments. The segments belong to a segment set S with cardinality T. Tunstall developed the construction algorithm for the segment set to derive a proper and complete code; the performance of such a coder converges to the source entropy as T approaches infinity. A modified version of the

Tunstall algorithm is proposed with improved coding efficiency. It is shown that high speed, software based decoding can be implemented, with significantly lower complexity than Huffman schemes. ESA

HIGHER ORDER RECURSIVE PROGRAM SCHEMES ARE TURING INCOMPLETE
Zurab Khasidashvili Jul. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9348; ETN-94-95691) Copyright Avail: Issuing Activity (European Space Agency (ESA))

Higher Order Recursive Program Schemes (HRPS's) are defined by allowing metasubstitutions (as in the lambda calculus) in right hand sides of function and quantifier definitions. To study reductions in a HRPS, it is split into 'first order part' and 'pure substitution part'. A study of pure substitutions and several kinds of 'similarity' of redexes makes it possible to lift properties of (first order) RPS's to the higher order case. The crucial properties are that corresponding arguments of 'essentially similar' redexes are either both essential or both inessential, and that essentially similar redexes create essentially similar redexes. The main result is the decidability of weak normalization in HRPS's, which immediately implies that HRPS's do not have full computational power. The structural properties of HRPS's are analyzed, and several kinds of 'persistent' higher order rewrite systems that enjoy similar properties are introduced. For 'uniformly' persistent systems, an efficient optimal sequential normalizing strategy is designed. ESA

The properties of WN (Weak Normalization), SN (Strong Normalization), WCR (Weak Church-Rosser) and completeness of functional term rewriting systems are preserved if systems are curried into applicative term rewriting systems. Under the condition of left linearity, the properties CR (Church-Rosser or Confluence), NF (Normal Form), UN and UN(forward arrow) (two properties concerning unique normal forms), and semi completeness, are also preserved by currying. By a counterexample, it is shown that the latter set of properties, with the possible exception of semi completeness, are in general not preserved for non left linear systems. ESA

MODELING SYSTEMS BY PROBABILISTIC PROCESS ALGEBRA: AN EVENT STRUCTURES APPROACH
Joost-Pieter Katoen, Rom Langerak, and Diego Latalla 1993 24 p Revised Sponsored in part by CNR-NATO Advanced Fellowships Program Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3755)
(Memo-INF-93-29-Rev; TIOS-93-17; ETN-94-95714) Copyright Avail: CASI HC A03

A probabilistic version of a subset of the process algebra LOTOS (Language of Temporal Ordering Specification) is addressed. It incorporates a probabilistic choice assigning a probability of occurrence to each of its alternatives. Opposed to the traditional interleaving semantics used for existing probabilistic process algebras the presented language is based on a true concurrency semantics. This enables a distinction to be made between non determinism and parallelism, the state explosion problem to be reduced and part of the system to be analyzed without considering other (irrelevant) parts. The language is presented and the formal semantics is defined by using an extension of bundle event structures. Two examples illustrate the novelties of the language and link the langauge to stochastic analysis based on semi Markov chains. ESA

MANIFOLD VERSION 1.0 PROGRAMMING: PROGRAMS AND PROBLEMS
Kees L. Blom Jun. 1993 42 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9334; ETN-94-95676) Copyright Avail: CASI HC A03

MANIFOLD is a programming language designed to control multiple concurrent activities by managing the communications among a number of active communicating entities. The present initial version of the MANIFOLD language is a minimal language attempting solely to implement a conceptual model of asynchronously communicating processes, called the MANIFOLD model. Such a model can be useful in an implementation environment where processes and interprocess communication are fast and amply available (for example massive parallelism). A tutorial introduction to the first experimental version of the MANIFOLD language (using listings of simple working example programs) is presented, followed by four larger working programs. The detailed operation of each of these latter four programs is described with the help of illustrations, and a number of language features and problems are explained. The MANIFOLD conceptual model and language are both concluded to be implementable and to actually work, and in their initial first experimental versions, they have some imperfections which must be taken into account in the design and implementation of the next version of the MANIFOLD system. TOPOLOGICAL MODELS FOR HIGHER ORDER CONTROL FLOW
J. W. deBakker (Vrije Univ., Amsterdam, Netherlands.) and F. vanBreugel (Vrije Univ., Amsterdam, Netherlands.) Jun. 1993 22 p Presented at the 9th Conference on the Mathematical Foundations of Programming Semantics, New Orleans, LA, 7-10 Apr. 1993 Submitted for publication Sponsored in part by Netherlands Nationale Faciliteit Informatica Programme
(ISSN 0169-118X)
(CWI-CS-R9340; ETN-94-95682) Copyright Avail: CASI HC A03/MF A01

Semantic models for two simple imperative languages with higher order constructs are presented. In the first language the interesting notion is that of second order assignment x:= s, for x a procedure variable and s a statement. The second language extends this idea by a form of higher

order communication, with statements c! and c?x, for c a channel. perational and denotational models are developed for both languages and their relationships are studied. Both in the definitions and the comparisons of the semantic models, convenient use is made of some tools from (metric) topology. The operational models are based on (SOS style) transition systems; the denotational definitions use domains specified as solutions of domain equations in a category of 1 bounded complete ultrametric spaces. In establishing the connection between the two kinds of models, fruitful use is made of Rutten's 'processes as terms' technique. Another tool consists of the use of 'metric' transition systems, with a metric defined on the configurations of the system. In addition to higher order programming notions, higher order definition techniques are used, for example in defining the semantic mappings as fixed points of (contractive) higher order operators. By Banach's theorem, such fixed points are unique, yielding another important proof principle. ESA

THE BOLTZMANN ENTROPY AND RANDOMNESS TESTS

Peter Gacs (Boston Univ., MA.) Jun. 1993 31 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract NF-62-376; NSF CCR-90-02614) (ISSN 0169-118X)

(CWI-CS-R9342; ETN-94-95684) Copyright Avail: CASI HC A03

Descriptional (Kolmogorov) complexity has a certain well understood relation to the information theoretical entropy introduced by Shannon. The latter is, by its form, related to the Gibbs entropy of statistical mechanics. Entropy in physics has several different definitions, and a history of philosophical controversy concerning the related notion of irreversibility. The necessary concepts of thermodynamics, complexity and randomness tests are introduced, and some of the connections to physics are developed by introducing a notion called 'algorithmic entropy'. This, on the one hand, is in a simple relation to randomness tests (of Martin-Lof and others), and on the other hand, is a connecting link between description complexity, Gibbs entropy and Boltzmann entropy. Its coarse grained approximation is shown to have the desirable properties of Boltzmann entropy on a somewhat wider range of systems, including those of interest in the 'thermodynamics of computation'. It is hoped that eventually these concepts will prove helpful not only for computer science but also for physics and dynamical system theory, by extending thermodynamical reasoning to some new classes of systems. For all constants k, l, explicit algorithms are presented, that given a graph G = (V, E) with a tree decomposition of G with treewidth at most l, decide whether the treewidth (or pathwidth) of G is at most k, and if so, find a tree decomposition (path decomposition) of G of width at most k and that uses O(absolute value of V) time. In contrast with previous solutions, the algorithms do not rely on nonconstructive reasoning and are single exponential in k and l. This result can be combined with a result of Reed, yielding explicit O(n log n) algorithms for the problem, given a graph G, to determine whether the treewidth of G is at most k, and if so, to find a tree decomposition of width at most k (k constant). It is also shown that for all constants k, there exists a polynomial time algorithm that, when given a graph G = (V, E) with treewidth less than or equal to k, computes the pathwidth of G and a path decomposition of G of minimum width. EFFICIENT BOUNDED TIMESTAMPING USING TRACEABLE USE ABSTRACTION: IS WRITER'S GUESSING BETTER THAN READER'S TELLING?

S. Haldar Sep. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract NF-62-376) (ISSN 0924-3275)

(RUU-CS-93-28; ETN-94-95665) Avail: CASI HC A03

'Traceable use' is a helpful abstraction to recycling values in bounded wait-free systems. Several researchers have demonstrated the power of the traceable use abstraction in constructing concurrent timestamping systems, snapshot variables, and bounded round numbers. An efficient implementation technique of the traceable use abstraction, which is used in developing a new construction of concurrent timestamping systems, is presented. This new construction is simpler than the other traceable use abstraction based construction in the literature. The new implementation exhibits that sometimes writer's guessing is better than reader's explicit telling. ESA

THE SECRETS OF CAUSALITY

F. Rietman Sep. 1993 71 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract NF-62-518) (ISSN 0924-3275)

(RUU-CS-93-29; ETN-94-95666) Avail: Issuing Activity (European Space Agency (ESA))

A model for a relational calculus for distributed program design is introduced. The distributed programs are compositions of so called 'processes.' The construction of the model is guided by desired properties for several forms of composition of processes, such as sequential composition and feedback. Functionality (determinism) and totality of processes are defined. After the observation that functionality and totality are not preserved by the feedback operator, the class of 'causal' processes is introduced. Causality is shown to guarantee the preservation by the feedback of functionality and totality. ESA

Operational (O) and Denotational (D) semantic models are designed for a language incorporating a version of the UNIX fork and pipe commands. Taking a simple imperative language as starting point, a number of programming constructs are added which achieve that a program can generate a dynamically evolving linear array of processes connected by channels. Over these channels sequences of values ('streams') are transmitted. Both O and D are defined as (unique) fixed point of a contractive higher order operator. This allows a smooth proof that O and D are equivalent. Additional features are the use of hiatons, and the closely related syntactic resumptions and semantic continuations. ESA

(MEMO-1149; ETN-94-95723) Avail: CASI HC A03/MF A01

Necessary and sufficient conditions are presented for the existence of an integer N such that the process x(sub i)(r) = max (j greater than or equal to 1 and less than or equal to n) (a(sub ij) + x(sub j)(r-1)), i greater than or equal to 1 and less than or equal to n, r greater than or equal to 1, satisfies x(sub i)(r + 1) = c + x(sub i)(r) for all r greater than or equal to N and all initial conditions x(sub i)(0). If such an integer N exists the property can be interpreted as a horizon theorem for a finite state space deterministic decision process with unbounded horizon. ESA

NUMERICAL PRECISION AND ROUNDOFF CONSIDERATIONS CONCERNING COMPUTER CODE MIGRATION
K. N. Schwinkendorf Dec. 1993 9 p Presented at the Simulation Multi Conference, San Diego, CA, 11-15 Apr. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC06-87RL-10930)
(DE94-005421; WHC-SA-2178; CONF-940456-6) Avail: CASI HC A02

Code conversion between different computer platforms may not be as straightforward or as simple as some people might think. When migrating computer codes between different computers, thought must be given to the importance of numerical precision. Some applications require greater numerical precision than others. Cray architecture treats floating-point numbers and operations as double precision compared to most other platforms, many of which are based on a 32-bit architecture. In some systems, only 32-bit compilers are available, even though the hardware is 64 bit. The default floating-point representation on the Cray is 15-place accuracy, as compared to 8 places on most workstations. Some applications do not inherently require accuracy to the 15th decimal place. Examples in nuclear engineering include Monte Carlo simulations, where numerical round-off error generated in the tracking of one neutron does not propagate seriously to neutrons in succeeding generations. Other applications, particularly time-dependent simulations, are susceptible to the cumulative effects of round-off errors. In addition, multidimensional transient simulations require an iterative solution methodology, whether the simulation is of groundwater contamination, space-time nuclear kinetics, fluid flow, or chemical migration. This paper will at least partially address the concerns of numerical precision by illustrating by example what differences in precision can do to the running of a simulation. DOE

USE OF BAD TRAINING DATA FOR BETTER PREDICTIONS
T. Grossman and A. Lapedes 1994 9 p Presented at the Neural Information Processing Systems (NIPS) Conference, Denver, CO, 30 Nov. - 2 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-006233; LA-UR-94-111; CONF-9311171-1) Avail: CASI HC A02

We show how randomly scrambling the output classes of various fractions of the training data may be used to improve predictive accuracy of a classification algorithm. We present a method for calculating the 'noise sensitivity signature' of a learning algorithm which is based on scrambling the output classes. This signature can be used to indicate a good match between the complexity of the classifier and the complexity of the data. Use of noise sensitivity signatures is distinctly different from other schemes to avoid overtraining, such as cross-validation, which uses only part of the training data, or various penalty functions, which are not data-adaptive. Noise sensitivity signature methods use all of the training data and are manifestly data-adaptive and nonparametric. They are well suited for situations with limited training data. DOE

PLACING REGISTRATION MARKS
Anil S. Rao and Kenneth Y. Goldberg Jun. 1993 24 p Sponsored in part by EEC; National Inst. for Standards and Technology; Institute for Manufacturing and Automation Research; and Adept Technology, Inc. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant NSF IRI-91-23747) (ISSN 0924-3275)
(RUU-CS-93-21; ETN-94-95658) Avail: Issuing Activity (European Space Agency (ESA))

In industrial assembly, a registration mark can be placed on parts to aid a computer vision system in determining the position and orientation of the parts. However, when sensor noise and limits on resolution introduce errors in the measured location of the registration mark, these errors can propagate into the measurement of part pose. A definition of the registration mark problem is given: given an n sided rigid planar polygonal part and a set of k poses for the part, locate a point on the surface of the part that maximizes the minimum distance between transformed points. A registration mark at this point will be maximally robust to sensor imperfections. An O((n log n) + (k(exp 4)(log k log(star)k) time algorithm to solve this planar problem using a result from Schwartz and Sharir is given and the algorithm is demonstrated using a commercial vision system. The results extend to classes of curved planar parts and polyhedral parts. ESA

RELATIONS BETWEEN VARIETIES OF KOLMOGOROV COMPLEXITIES
Vladimir A. Uspensky (Moscow M. V. Lomonosov Inst. of the Technology of Fine Chemicals, USSR.) and Alexander Shen (Moscow M. V. Lomonosov Inst. of the Technology of Fine Chemicals, USSR.) Apr. 1993 41 p Sponsored by Netherlands Organization for Scientifc Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9329; ETN-94-95672) Copyright Avail: CASI HC A03

There are several sorts of Kolmogorov complexities: decision complexity, simple complexity, prefix complexity, monotonic complexity, and a priori complexity. The last three can and the first two cannot be used for defining randomness of an infinite binary sequence. All five versions of Kolmogorov complexity were previously considered from a unified point of view. Upper and lower bounds for those complexities and also for their differences were announced without proofs. Proofs for those bounds are presented. The word 'entropy' (not in a physical sense) is used instead of 'complexity', which is a Moscow tradition suggested by A.N. Kolmogorov himself. By this tradition the term 'complexity' relates to any mode of description and 'entropy' is the complexity related to an optimal mode (that is, to a mode that, roughly speaking, gives the shortest descriptions). ENGINEERING OF SYSTEMS FOR APPLICATION OF SCIENTIFIC COMPUTING IN INDUSTRY WP PROJECT MANAGEMENT ISNaS 9209099

W. Loeve 9 Sep. 1992 34 p Presented at the Effective Concurrent Engineering in Aerospace Industry Seminar, Paris, France, 8-10 Apr. 1992, and IFIP WG5.2, WG5.2 CATE TF Workshop on Manufacturing in the ERA of Concurrent Engineering, Tel-Aviv, Israel, 13-15 Apr. 1992 Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-126232; NLR-TP-126232; ETN-94-95557) Avail: CASI HC A03

A method for development and production of mathematics software is presented. The aim of the method is to produce software that can be applied for simulation purposes in industry. It is argued that mathematics software for applications in industry can be realized only if various specialists contribute to the development and production process. For this reason, the method is designed in such a way that it supports cooperative engineering preocesses. The method has organizational and technical aspects. Both aspects need equal attention for the method to be effective. The quality of the result of application of the method depends on the skills and the attitude of the specialists that are involved in the development and production process. ESA

MAPPING OBJECTS TO FILES: A UNIX FILE SYSTEM INTERFACE TO AN OBJECT MANAGEMENT SYSTEM

Gert Florijn, Leo Soepenberg, and Atze Dijkstra Feb. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-93-08; ETN-94-95645) Avail: CASI HC A03

The design of a UNIX file system interface for the Camera Object Management System (OMS), an extensible, fully object oriented environment comparable to Smalltalk, is described. The interface was developed to let the UNIX system act as a user interface to the OMS, and to be able to run existing UNIX tools from within the OMS. Via the interface, users are presented with a file tree which in actual fact is generated from objects and attributes stored in the OMS. Manipulating the tree implies sending messages to OMS objects. The design uses the NFS (Network File System) protocol for client-server communication and is based on a user level NFS server that connects to multiple OMS processes. Essential in the architecture is that one particular mapping is not imposed from OMS concepts (objects, etc.) to a file tree. Instead, a multiple of such mappings (or views) can be defined within each OMS. Furthermore, it is possible to switch dynamically between views. The design goals are discussed, the major components of the system are described and examples of how object oriented concepts in the OMS can be accommodated in a UNIX file tree are given, by describing some of the sample views. UNRAVELLING NONDETERMINISM: ON HAVING THE ABILITY TO CHOOSE

W. vanderHoek, B. vanLinder, and J. J. C. Meyer Sep. 1993 37 p Sponsored in part by EEC; Vrije Univ.; and Katholieke Univ. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-93-30; ETN-94-95667) Avail: CASI HC A03

Ways to incorporate nondeterminism in a system designed to formalize the reasoning of agents concerning their abilities and the results of the actions that they may perform are demonstrated. A distinction is made between two kinds of nondeterministic choice operators: one that expresses an internal choice, in which the agent decides what action to take, and one that expresses an external choice, which cannot be influenced by the agent. The presence of abilities in the system is the reason why the usual approaches towards nondeterminism cannot be used. The semantics defined for nondeterministic actions is based on the idea that composite actions are unravelled in the strings of atomic actions and tests that constitute them. The main notions used in defining this semantics are finite computation sequences and finite computation runs of actions. The results obtained meet intuitions regarding events and abilities in the presence of nondeterminism. ESA

PARALLEL LANGUAGE CONSTRUCTS FOR PARADIGM INTEGRATION AND DETERMINISTIC COMPUTATIONS

K. M. Chandy and I. T. Foster 1993 10 p Presented at the Parallel Computing 1993 Conference, Grenoble, France, 7-10 Sep. 1993

(Contract W-31-109-eng-38)

(DE94-005119; ANL/MCS/CP-81591; CONF-9309319-1) Avail: CASI HC A02/MF A01

We describe parallel extensions of sequential programming languages for writing programs that integrate different programming paradigms and that execute in heterogeneous environments comprising both distributed and shared memory. The extensions can be used to write programs with dynamic process and communication structures. Programs can use shared-memory, message passing, and data parallel programming paradigms, and can be written in a way that permits the compiler and run-time system to verify that they are deterministic. The extensions also provide the programmer with control over how data and processes are mapped to processors, and hence how computational resources are allocated to different parts of a program. A subset of these ideas has been incorporated in an extension to Fortran called Fortran M. However, the underlying sequential notation is not central to the ideas. DOE

SYSTEMATIC ERROR ESTIMATION IN MULTISENSOR FUSION SYSTEMS

B. A. vanDoorn and H. A. P. Blom 3 Mar. 1993 18 p Presented at the SPIE Conference on Signal and Data Processing of Small Targets, Orlando, FL, 12-16 Apr. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-B179298; NLR-TP-93094-U; ETN-94-95970) Avail: CASI HC A03

An algorithm to estimate the systematic macro errors in multisensor fusion systems is evaluated. For abruptly changing macro errors this requires dynamic estimation of these macro errors, online with the maintenance of tracks. The problem with this dynamic estimation is that, in theory, their filter equations are coupled to the track maintenance equations for the individual tracks. Hence, to keep things manageable, an approach to decouple filter equations for macro error estimation from the track maintenance filter equations is developed. The result is a Kalman-like filter, called the macro filter. For this macro filter, experimental results are presented to illustrate its effectiveness. The problem is formulated by means of a system equation and an observation equation. For this problem, the exact Kalman filter equations are given and the approach for the decoupling of the macro filter equations from the track maintenance filter is derived. This is networked out for a single sensor situation and it is extended to multiple sensors of different type. The results of some experiments for the macro filter are described. ESA

A NEW PROGRAMMING METHODOLOGY FOR LAZY FUNCTIONAL LANGUAGES

F. A. vanGilst and P. M. vandenBroek Sep. 1993 18 p

(ISSN 0924-3755)

(Memo-INF-93-44; ETN-94-95718) Copyright Avail: CASI HC A03/MF A01

A programming methodology for lazy functional programming languages is presented. It is based on divide and conquer: the division of problems into subproblems. Such a division is represented by a call graph. A class of program schemes, which implement call graphs, is derived based on Johnsson's approach to attribute evaluation in attribute grammars. The key idea is to consider the passing of arguments to functions and the return of results by functions in a call graph as the propagation of inherited and synthesized attributes respectively in an attribute grammar. The methodology is illustrated by examples and a case study: the design and implementation of a compiler generator. Author

VALIDATION EXPERIMENTS WITH AN ETHERNET MODEL USING THE SIMULATION TOOL 'PROMISE'

G. Wedzinga 25 May 1989 28 p Presented at the 1989 European Computer Simulation Conference, Edinburgh, Scotland, 5-8 Sep. 1989 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-B174795; NLR-TP-89191-U; ETN-94-95563) Avail: CASI HC A03

The validation of an Ethernet simulation model with the aid of the PROMISE simulation tool is described. PROMISE is a general computer based simulation tool for studying systems consisting of concurrent processes. Ethernet is a packet switching, broadcast, multiaccess local area network, using carrier sense and collision detection as access procedure. The Ethernet simulation model consists of two interconnected submodels, that is, a controller submodel and a channel submodel. Both submodels are fully parametrized, allowing all Ethernet parameters to be varied and giving a free choice of the network configuration. The Ethernet model is validated using measurements of Ethernet performance by Boggs, Mogul and Kent. The results of the simulation show good agreement with the measurements. ESA

THEORETICAL AND EXPERIMENTAL ANALYSIS OF A NEW ALGORITHM FOR THE EUCLIDEAN 1-CENTER PROBLEM

Giovanni Righini Jun. 1993 9 p Sponsored in part by Ministry of University and Scientific and Technological Research

(Rept-93-045; ETN-94-95813) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A geometrical algorithm for the euclidean 1-center problem is addressed. Its time complexity was previously conjectured to be linear in the number of points. Such conjecture is now proven to be false by a counter-example. Nevertheless experimental analysis of the algorithm behavior on random generated instances shows that the amount of computing time grows linearly with the number of points both in the weighted and in the unweighted cases. ESA

HEURISTIC ALGORITHMS FOR STATIC AND DYNAMIC PROBLEMS OF LOCATING THE CENTER AND THE BARYCENTER OF A GRAPH

Giovanni Righini Jul. 1993 19 p Sponsored in part by Ministry of University and Scientific and Technological Research

(Rept-93-050; ETN-94-95815) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Given a graph with weights on the vertices as well as on the edges, two location problems are considered: locating the absolute center and the absolute barycenter of the graph. The dynamic version of the problems is also considered. Iterative approximated algorithms are proposed: they use as a subroutine the exact algorithm for finding the optimal location on a tree. A local search procedure which makes such algorithms much more robust is presented. The algorithms do not require the calculation of the shortest distance for every pair of vertices. ESA

N94-30928 Politecnico di Milano (Italy). Dipt. di Elettronica e Informazione.

FEDERAL GRAMMARS AND MODULAR COMPILERS

Stefano Crespi-Reghizzi and Giuseppe Psaila Sep. 1993 97 p Sponsored in part by EEC; Politecnico di Milano, and CNR-CSISEI

(Rept-93-054; ETN-94-95818) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

The process of designing a large language at the same time as its compiler causes repeated changes to the latter. The cost of changes is compounded with team coordination overhead for large projects. In order to confine changes, the notions of syntax module and of federal grammar as a set of modules are introduced. Deterministic LL(1) parsing conditions are defined for federal grammars. Modularity is defined for semantic evaluation based on attribute grammars. A set of tools was implemented for federal grammar design within the ATELIER Grammatica environment. The proposed approach and tools were used for the design of the deductive, active, object oriented DB language Chimera. The method is also potentially useful for embedding one language into another. THE STRUCTURE OF EXPONENTIALS: UNCOVERING THE DYNAMICS OF LINEAR LOGIC PROOFS
Vincent Danos (Paris VII Univ., France.), Jean-Baptiste Joinet (Paris VII Univ., France.), and Harold Schellinx May 1993 23 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3315)
(ML-93-10; ETN-94-95986) Avail: CASI HC A03

The exponential graph of proof pi in (second order) linear logic, an artefact that displays the interdependencies of exponentials, is constructed. Within this graph superfluous exponentials are defined, the removal of which is shown to yield a correct proof pi(sup triangle pointing to the right) with essentially the same set of reductions. Applications to intuitionistic and classical logic are obtained by means of reduction preserving embeddings: a given proof is embedded into linear logic, then the removal procedure is applied to it, resulting in a least, (that is, optimally) exponentiated linearization of the original proof. Things are then put the other way round, and families of linear logics in which exponential dependencies are ruled by a given graph are defined. ESA

DESIGN OF PARALLEL SYSTEMS FOR SIGNAL PROCESSING
Edward A. Lee 3 Sep. 1993 18 p
(AD-A275490) Avail: CASI HC A03/MF A01

This report concludes phase 1 of the project. Two significant accomplishments are reported, the first relating to the design of heterogeneous parallel systems, and the second related to the synthesis of a parallel program for the CM-5 from Thinking Machines. A methodology for design and evaluation of parallel architectures with heterogeneous components has been developed. Specifically, the communicating processes (CP) domain in Ptolemy has been used to model heterogeneous parallel hardware systems. The first demonstration design uses the alternative low-level primitive structures (ALPS) concept. The CP domain in Ptolemy has a multitasking kernel managing concurrent processes. A process, or thread, is created for each computational and communications system resource in a particular design. The CP model of computation makes it easy to write and interconnect a variety of computational resources and simulate the execution of an application to evaluate the particular architectural configuration. The beginning of a true massively parallel processor based on holographic technology is presented. The theory, algorithms, and initial research are set forth and explored. Preliminary research results show great possibility for this architecture in areas of large-scale interconnects, and low-energy processing. Future research efforts, as well as possible applications, are also discussed. DTIC

INVESTIGATION INTO FORMALIZATION OF DOMAIN-ORIENTED PARALLEL SOFTWARE DEVELOPMENT M.S. Thesis
Daniel P. King 15 Dec. 1993 240 p
(AD-A275177; AFIT/GCE/ENG/93D-08) Avail: CASI HC A11/MF A03

This research investigates the conceptual design of a semi-automated platform for parallel software development. The proposed semi-automated environment applies transformational techniques and domain-specific knowledge to a parallel software development process. Domain-specific and software design knowledge interact within the transformational development process in the creation of a software application. The underlying parallel specification language requires a set of parallel composition operators in order to capture an application's concurrent properties. A set of parallel composition operators is proposed that consists of parallel composition, parallel enumeration, nondeterministic choice, and sequential composition; specific communication and synchronization variable types are also proposed. A semi-automated environment based on this set of composition operators is considered and presented. DTIC

This documentation briefly describes and explores the basic functionality of using the Internet computer network for e-mail, ftp (file transfer protocol), and telenet. In addition, once these basics are mastered, the user is provided with a bibliography of sources available on the Internet and in traditional print sources. This is a beginners guide and is intended to help the novice user begin using the Internet. Navigational tools such as Gopher, WAIS (wide area information servers), and World Wide Web (WWW) are mentioned. Also included are a guide to Netiquette and Internet Sources of Government Information. DTIC

This program, entitled 'Nurturing ECSU Research Talent in Parallel Processing and Computer Visualization' focuses on undergraduate education and undergraduate research experiences in computer science. Nurturing these young researchers will be our primary concern. Highest priority will be given to providing them with the guidance and skills to insure their entrance and success in graduate school. Further, each student in our program will learn the fundamentals of scientific research as they conduct investigations in parallel processing and computer visualization. Student development activities will include the following: (1) Recruitment of 20 high ability minority students; (2) Providing a summer program for recruited students; (3) Providing research experiences in computer visualization and parallel processing; (4) Providing a mentor, graduate school counseling and GRE preparation; (5) Providing financial support for students in the form of research scholarships; and (6) Providing funds for student travel. We are also proposing to strengthen the infrastructure of the Mathematics and Computer Science Department of ECSU. Activities proposed are: (1) Enhancement of current computer graphics and operating systems courses; (2) Development of two new courses in parallel processing and computer visualization (PPCV); (3) Acquisition of computer equipment appropriate to support PPCV research; (4) Establishing a visiting lecture series in computer science; and (5) Hiring a UNIX network manager. This project will build on the lessons learned and resources acquired during the 1991-93 ONR pilot program at ECSU. DTIC

DEPENDABILITY ANALYSIS OF PARALLEL SYSTEMS USING A SIMULATION-BASED APPROACH M.S. Thesis
Darren Charles Sawyer 2 Feb. 1994 70 p
(Contract NAG1-613; N00014-91-J-1116)
(NASA-CR-195762; NAS 1.26:195762; UILU-ENG-94-2203; CRHC-94-02)
Avail: CASI HC A04/MF A01

The analysis of dependability in large, complex, parallel systems executing real applications or workloads is examined in this thesis. To effectively demonstrate the wide range of dependability problems that can be analyzed through simulation, the analysis of three case studies is presented. For each case, the organization of the simulation model used is outlined, and the results from simulated fault injection experiments are explained, showing the usefulness of this method in dependability modeling of large parallel systems. The simulation models are constructed using DEPEND and C++. Where possible, methods to increase dependability are derived from the experimental results. Another interesting facet of all three cases is the presence of some kind of workload of application executing in the simulation while faults are injected. This provides a completely new dimension to this type of study, not possible to model accurately with analytical approaches. Author

CHECKPOINT-BASED FORWARD RECOVERY USING LOOKAHEAD EXECUTION AND ROLLBACK VALIDATION IN PARALLEL AND DISTRIBUTED SYSTEMS Ph.D. Thesis, 1992
Junsheng Long 28 Jan. 1994 166 p
(Contract NAG1-613; N00014-91-J-1283)
(NASA-CR-195760; NAS 1.26:195760; UILU-ENG-94-2201; CRHC-94-01)
Avail: CASI HC A08/MF A02

This thesis studies a forward recovery strategy using checkpointing and optimistic execution in parallel and distributed systems. The approach uses replicated tasks executing on different processors for forwared recovery and checkpoint comparison for error detection. To reduce overall redundancy, this approach employs a lower static redundancy in the common error-free situation to detect error than the standard N Module Redundancy scheme (NMR) does to mask off errors. For the rare occurrence of an error, this approach uses some extra redundancy for recovery. To reduce the run-time recovery overhead, look-ahead processes are used to advance computation speculatively and a rollback process is used to produce a diagnosis for correct look-ahead processes without rollback of the whole system. Both analytical and experimental evaluation have shown that this strategy can provide a nearly error-free execution time even under faults with a lower average redundancy than NMR. Author (revised)

PROGRESS REPORT FOR THE PTUF PROJECT-93 Q1 AND Q2
T. H. Hansen 5 Sep. 1993 22 p Prepared in cooperation with Norges Tekniske Hoegskole, Trondheim, and Norske Data A.S., Oslow, Norway
(PB94-138591; STF10-A93015) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report describes the research activities related to the PTUF project (Parallel Technology in Research and Education at NTH, SINTEF and Statoil) and the results achieved throughout the first six months of 1993. The PTUF project was initiated in 1992. The main objective of the project is to establish competence and experience on application of Massively

Parallel Programming (MPP) technology. The 56 node Intel Paragon XP/S parallel supercomputer purchased for the project was installed in December 1992. The report refers to the early experiences with Intel Paragon. Encouraging results have been achieved in areas like computational fluid dynamics, weather forecasting, and molecular dynamics. Research plans for the project and software update plans for the Paragon for Q3 and Q4 of 1993 are also included. NTIS

COMPUTATIONAL BALANCE IN REAL-TIME CYCLIC SPECTRAL ANALYSIS
R. S. Roberts and H. H. Loomis, Jr. 1993 4 p Presented at the International Acoustics, Speech and Signal Processing Conference, Adelaide, Australia, 19-22 Apr. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-005091; LA-UR-93-4435; CONF-940476-1) Avail: CASI HC A01

Real-time cyclic spectral analysis is useful in many applications, but is difficult to achieve because of its computational complexity. This paper studies the distribution of complex multipliers in multiprocessor cyclic spectrum analyzers, with the objective of obtaining computational balance. Computationally balanced implementations efficiently use hardware so that computational bottlenecks are reduced and a smooth flow of data between computational sections of the analyzer is maintained. Tables are presented that give the number of complex multipliers required in each section of the analyzer to obtain computational balance. DOE

UNSUPERVISED LEARNING IN ANALOG NETWORKS M.S. Thesis
Dean Kevin McNeill 1993 60 p
(ISBN-0-315-85959-8; CTN-94-61174) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Artificial neural networks have shown their usefulness in the solution of a number of complex problems such as pattern recognition and associative memories. These networks are typically simulated on serial computers or using expensive vector processors. Several issues are examined which are important to the implementation of unsupervised learning algorithms in compact dedicated analog structures. Two algorithms known as coherence based unsupervised learning (CBUL) and competitive learning are discussed in detail. A fully custom analog implementation of CBUL is presented and test circuitry implemented in 3-micrometer complementary metal oxide semiconductor (CMOS). These circuits make extensive use of a CMOS version of the Gilbert multiplier to perform most of the neural computations. A complete implementation of the coherence based network, with capacitive weight storage, would consist of about 20 neurons and 400 synapses when fabricated on a 1-cm silicon die. The effect of inherent device fabrication variations are examined in terms of their effects on construction of analog circuits for competitive learning. Simulations are conducted involving a number of modelled hardware effects. The results show that competitive learning is tolerant of most expected fabrication variations except for multiplier zero-crossing offset errors. Author (CISTI)

A LOCALLY SYNCHRONOUS GLOBALLY ASYNCHRONOUS VERTEX-8 PROCESSING ELEMENT FOR IMAGE RECONSTRUCTION ON A MESH M.S. Thesis
Jeffrey W. Fitchett Jul. 1993 125 p
(ISBN-0-315-86005-7; CTN-94-61177) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Image or field reconstruction problems from non-invasive measurements are a class of signal processing applications that demand parallel processing to achieve real-time operation. Image reconstruction from parallel beam projections, such as computerized tomography scans, falls within this class. A novel architecture is presented which is suitable for wafer scale integration (WSI) on which cyclic image processing algorithms could be embedded, namely the mesh of vertex-8 processors. Mapping of iterative reconstruction algorithms onto a fine-grained mesh of custom processors is illustrated, allowing inference of mappings for other image transform (such as the Hough transform) and pattern recognition problems. The focus is on the hardware design of a locally synchronous globally asynchronous vertex-8 processing element (PE) that is suitable for implementation in a WSI array with one PE per pixel. The PE has several unique features, including self-timed handshaking elements for interprocessor communications and a novel asynchronous scan test structure. Test chips have been sent for fabrication. Author (CISTI)

(NASA-TM-109101; NAS 1.15:109101) Avail: CASI HC A04/MF A01

Semi-Markov models can be used to analyze the reliability of virtually any fault-tolerant system. However, the process of delineating all of the states and transitions in the model of a complex system can be devastatingly tedious and error-prone. Even with tools such as the Abstract Semi-Markov Specification Interface to the SURE Tool (ASSIST), the user must describe a system by specifying the rules governing the behavior of the system in order to generate the model. With the Table Oriented Translator to the ASSIST Language (TOTAL), the user can specify the components of a typical system and their attributes in the form of a table. The conditions that lead to system failure are also listed in a tabular form. The user can also abstractly specify dependencies with causes and effects. The level of information required is appropriate for system designers with little or no background in the details of reliability calculations. A menu-driven interface guides the user through the system description process, and the program updates the tables as new information is entered. The TOTAL program automatically generates an ASSIST input description to match the system description. Author

AN ALL PAIRS SHORTEST PATHS DISTRIBUTED ALGORITHM USING 2n(EXP 2) MESSAGES
S. Haldar May 1993 20 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract NF-62-376) (ISSN 0924-3275)
(RUU-CS-93-19; ETN-94-95656) Avail: CASI HC A03

An investigation into the efficient building of a routing table for an arbitrary network is presented. In an execution of a distributed program, processes communicate among themselves by exchanging messages. The

execution speed of the program could be expedited by a faster message delivery system, transmitting messages to their destinations through their respective shortest paths. Some distributed algorithms were proposed in recent years for determining all pairs shortest paths for an arbitrary computer network. The best known algorithm uses O(n(exp 2) log n) messages, where n is the number of computers in the network. A distributed algorithm for the same problem using 2n(exp 2) messages in the worst case is presented. This algorithm uses a strategy quite different from those of the other algorithms for the same problem. ESA

MANRAY: A REPLICATED WORKERS PROGRAM IN MANIFOLD

P. Spilling and F. Arbab Jun. 1993 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0169-118X)

(CWI-CS-R9337; ETN-94-95679) Copyright Avail: Issuing Activity (European Space Agency (ESA))

Management of the communications among a set of concurrent processes arises in many applications and is a central concern in parallel computing. MANIFOLD is a coordination language whose sole purpose is to describe and manage complex interconnections among independent, concurrent processes. In the underlying paradigm of this language, the primary concern is not with what functionality the individual processes in a parallel system provide. Instead, the emphasis is on that these processes are inter-connected and how their interaction patterns change during the execution life of the system. The language is described, and as an example of the application of MANIFOLD, it is shown how a replicated workers program can be implemented in MANIFOLD. The concern is to show the expressiveness of MANIFOLD, and its usefulness in practice. ESA

ON THE RELATION BETWEEN UNITY PROPERTIES AND SEQUENCES OF STATES

R. T. Udink and J. N. Kok Feb. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract SION-612-317-107) (ISSN 0924-3275)

(RUU-CS-93-07; ETN-94-95644) Avail: CASI HC A03

Stepwise refinement of programs has proven to be a suitable method for developing parallel and distributed programs. Different notions of program refinement for Unity are examined and compared. Two of these notions are based on execution sequences. Refinement corresponds to the reduction of the set of execution sequences, that is, reducing the amount of nondeterminism. The other refinement notions are based on Unity properties as introduced by Chandy and Misra. The Unity approach is to refine specifications. Although it has proven a suitable formalism for deriving algorithms, it seems less suitable for handling implementation details. Following Sanders and Singh, program refinement is formalized in the Unity framework as the preservation of Unity properties. Unity properties are shown to be not powerful enough to characterize execution sequences. As a consequence, the notion of property preserving refinement differs from the notion of reducing the set of execution sequences. ESA

PARALLEL ITERATION ACROSS THE STEPS OF HIGH ORDER RUNGE-KUTTA METHODS FOR NONSTIFF INITIAL VALUE PROBLEMS

P. J. vanderHouwen, B. P. Sommeijer, and W. A. vanderVeen Aug. 1993 18 p Sponsored in part by Netherlands Foundation for the Technical Sciences Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0169-0388)

(CWI-NM-R9313; ETN-94-95670) Copyright Avail: CASI HC A03

For the parallel integration of nonstiff Initial Value Problems (IVP's), three main approaches can be distinguished: approaches based on 'parallelism across the problem,' 'parallelism across the method,' and on 'parallelism cross the steps'. The first type of parallelism does not require special integration methods and can be exploited within any available IVP solver. The method parallelism approach received much attention, particularly within the class of explicit Runge-Kutta methods originating from fixed point iteration of implicit Runge-Kutta methods of Gaussian type. The construction and implementation on a parallel machine of such methods is extremely simple. Since the computational work per processor is modest with respect to the number of data to be exchanged between the various processors, this type of parallelism is most suitable for shared memory systems. The required number of processors is roughly half the order of the generating Runge-Kutta method, and the speed up with respect to a good sequential IVP solver is about a factor 2. The third type of parallelism (step parallelism) can be achieved in any IVP solver based on predictor corrector iteration and requires the processors to communicate after each full iteration. If the iterations have sufficient computational volume, then the step parallel approach may be suitable for implementation on distributed memory systems. Most step parallel methods proposed so far employ a large number of processors, but they lack the property of robustness due to a poor convergence behavior in the iteration process. Hence, the effective speed up is rather poor. The dynamic step parallel iteration process proposed is less massively parallel, but turns out to be sufficiently robust to achieve speed up factors up to 15. ESA

SUPERCOMPUTING HAS TO BE PART OF AN ORGANIZATION-WIDE AUTOMATION CONCEPT

W. Loeve 11 Nov. 1990 15 p Presented at the Singapore Supercomputing Conference, 11-12 Dec. 1990 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-B174654; NLR-TP-90376-U; ETN-94-95564) Avail: CASI HC A03

The procedures and methods which have to be defined to support cooperation of specialists in development and application of digital simulation methods are described. It is concluded that supercomputers for development and application of advanced digital simulation methods have to be supplemented by workstations, mainframes and possibly minicomputers. The additional systems are needed for pre- and postprocessing and management of information in the form of enhanced data and software. The computer systems have to be connected via a network to form an infrastructure that can serve as a central nerve system of the organization. This has to enable specialists of different kinds to exchange information in cooperative execution of complicated tasks that are related to development of digital simulation methods and to application of these methods in computer aided engineering. In view of this, supercomputers shall support general communication standards. A high quality support organization is needed to keep the computer network and the implemented information in adequate condition. To this computer sciences specialists as well as application specialists shall contribute. ESA

(DE94-606067; JINR-E-10-93-86) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

In the present paper we study the following problems of track information extraction by the artificial neural network (ANN) rotor model: providing initial ANN configuration by an algorithm general enough to be applicable for any discrete detector in or out of a magnetic field; robustness to heavy contaminated raw data (up to 100% signal-to-noise ratio); and stability to the growing event multiplicity. These problems were carried out by corresponding innovations of our model, namely: by a special one-dimensional histogramming, by multiplying weights by a specially designed robust multiplier, and by replacing the simulated annealing schedule by ANN dynamics with an optimally fixed temperature. Our approach is valid for both circular and straight (non-magnetic) tracks and tested on 2D simulated data contaminated by 100% noise points distributed uniformly. To be closer to some reality in our simulation, we keep parameters of the cylindrical spectrometer ARES. DOE

THE STATE TRANSITION DIAGRAM WITH PATH PRIORITY AND IT'S APPLICATIONS M.S. Thesis
Thomas Scholz Sep. 1993 100 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275524) Avail: CASI HC A05

The overall software structure of the Naval Postgraduate School Autonomous Underwater Vehicle (NPS AUV) is the Rational Behavior Model (RBM), a tri-level, multilingual software architecture which is based on three levels of abstraction called the strategic, tactical, and execution level. In this study, interests were focused on the implementation of the strategic level in CLIPS such that it exhibits the same behavior as the already existing implementation written in Prolog. As a tool for translating a backward chaining version of the Strategic level software (like Prolog) to a forward chaining one (like CLIPS), the State Transition Diagram With Path Priority (STDWP) was introduced in this study. Specifically, STDWP allows graphical translation between backward and forward chaining versions of the strategic level. This research shows empirically that the translation is always possible and that the two versions hold logical and behavioral equivalence. Thus, STDWP bridges two approaches in robot control which are based on forward and backward chaining. DTIC

EXPERIMENTAL EVALUATION OF FUZZY LOGIC CONTROL OF A FLEXIBLE ARM MANIPULATOR Ph.D. Thesis
Joel Jackson 9 Dec. 1993 87 p
(AD-A275375; AFIT/CI/CIA/93-167) Avail: CASI HC A05/MF A01

The purpose of the research reported in this thesis was to explore fuzzy logic control of a single link, flexible robot arm. The performance and stability robustness properties of fuzzy logic control were evaluated in simulation and with hardware in the loop in the University of Washington Control Systems Laboratory. The plant model and the Integrated System, Inc., AC100-C30 real time control prototyping system were first validated using a PID controller, which was also used as a comparison for the performance of various fuzzy logic controllers. The control objective was to slew the arm rapidly to commanded positions while minimizing the excitation of the link's flexible modes. The available sensor was a hub angle sensor (no tip position or tip rate information was used for the controllers). The stability robustness of the PID controller and the fuzzy logic controller were evaluated in hardware for mismodeled system parameters. Tests were conducted for increased tip mass relative to the design condition controller as well as for a significantly more flexible link than the design condition. The fuzzy controller was found to be stable for all test conditions, while the PID controller was unstable for one of the off-design conditions. DTIC

PARTIAL SUPPORT FOR THE SECOND INTERNATIONAL SYMPOSIUM ON ARTIFICIAL INTELLIGENCE AND MATHEMATICS Final Report, 1 Jan. 1992 - 30 Apr. 1993
Frederick Hoffman 30 Apr. 1993 3 p Second Symposium held in Boca Raton, FL, 5-8 Jan. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0120)
(AD-A275199; AFOSR-94-0029-TR) Avail: CASI HC A01

For the Second Symposium, the invited speakers were Zolar Manna (Standford) 'Modular Temporal Reasoning,' Heinz-Otto Peitgen (Bremen and Florida Atlantic University, 'Cellular Automata, Fractals, and Attractors,' K. Ebcioglu (IBM Yorktown Heights), 'A logic Programming System for Chorale Harmonization,' and J. C. Latombe (Stanford), 'Geometry and Search in Motion Planning.' The program Committee accepted 52 papers and had speakers from 16 countries. The sessions were on logic, non-monotonic logic, theorem proving, logic programming, constraints, learning, reasoning, neutral networks, and genetic algorithms. Additionally, there was one session on applications and one general session. There was also a somewhat autonomous 'Autonomous Control Workshop', organized by Anil Nerode, and held concurrently with the Symposium. Sunday morning's session and the invited talks were plenary; there were two concurrent sessions the rest of the three and one-half days. DTIC

FEEDBACK CONTROL OF A THREE-LINK PLANAR UNDER-ACTUATED MANIPULATOR USING A SURGE VELOCITY M.S. Thesis
Pernell A. Jordan 23 Sep. 1993 46 p
(AD-A275159) Avail: CASI HC A03/MF A01

An under-actuated robot manipulator is one that has fewer joint actuators than the number of degrees of freedom of the manipulator. Such manipulators are studied with the objective of developing smarter mechanical systems; ones that can provide low-cost automation and enable design simplification. While in space these manipulators can afford to have any kind of mechanical structure, on earth they need to be strictly planar to be feasible. In this paper, we develop a control scheme for a three link planar robot manipulator with two actuators such that it can reach any joint configuration from any other. We assume that the first joint of the robot is passive and is provided with a brake and a rotary dashpot. We show that our control is robust to the variations in certain parameters and unmodelled dynamics like stiction. DTIC

NEURAL NETWORK SOLUTIONS TO LOGIC PROGRAMS WITH GEOMETRIC CONSTRAINTS Scientific Paper
Jo A. Parikh, Anne Werkheiser, and V. S. Subrahamanian Jan. 1994 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275419; TEC-R-206) Avail: CASI HC A03

Hybrid knowledge bases (HKB's), proposed by Nerode and Subrahmanian, provide a uniform theoretical framework for dealing with the mixed data types and multiple reasoning modes required for solving logical deployment problems. Algorithms based on mixed integer linear programming techniques have been developed for the syntactic subset of HKB's corresponding to function-free Prolog-like logic programs. In this study, we examine the ability of neural networks to solve a more comprehensive set of problems expressed within the hybrid knowledge base framework. The objective of this research is to design and implement a nonlinear optimization procedure for solving extended logic programs with neural networks. We focus upon two types of extensions which are typically required in the formulation of logical deployment problems. The first type of extension, which we shall refer to as a Type I extension, consists of embedding numerical and geometric constraints into logic programs. The second type of extension, which we shall call a Type II extension, consists of incorporating optimization problems into logic clauses. DTIC

This invention is a robot control system based on a high level language implementing a spatial operator algebra. There are two high level languages included within the system. At the highest level, applications programs can be written in a robot-oriented applications language including broad operators such as MOVE and GRASP. The robot-oriented applications language statements are translated into statements in the spatial operator algebra language. Programming can also take place using the spatial operator algebra language. The statements in the spatial operator algebra language from either source are then translated into machine language statements for execution by a digital control computer. The system also includes the capability of executing the control code sequences in a simulation mode before actual execution to assure proper action at execution time. The robot's environment is checked as part of the process and dynamic reconfiguration is also possible. The languages and system allow the programming and control of multiple arms and the use of inward/outward spatial recursions in which every computational step can be related to a transformation from one point in the mechanical robot to another point to name two major advantages.

A transient signal suppressor for use in a controls system which is adapted to respond to a change in a physical parameter whenever it crosses a predetermined threshold value in a selected direction of increasing or decreasing values with respect to the threshold value and is sustained for a selected discrete time interval is presented. The suppressor includes a sensor transducer for sensing the physical parameter and generating an electrical input signal whenever the sensed physical parameter crosses the threshold level in the selected direction. A manually operated switch is provided for adapting the suppressor to produce an output drive signal whenever the physical parameter crosses the threshold value in the selected direction of increasing or decreasing values. A time delay circuit is selectively adjustable for suppressing the transducer input signal for a preselected one of a plurality of available discrete suppression time and producing an output signal only if the input signal is sustained for a time greater than the selected suppression time. An electronic gate is coupled to receive the transducer input signal and the timer output signal and produce an output drive signal for energizing a control relay whenever the transducer input is a non-transient signal which is sustained beyond the selected time interval. INTEGRATION OF A PATH GENERATION ALGORITHM INTO OFF-LINE PROGRAMMING OF AIRBUS PANELS
L. Graux, P. Millies, P. L. Kociemba, and B. Langlois 1993 9 p
(Rept-932-600-103; ETN-94-95482) Avail: CASI HC A02/MF A01

A method for programming robot motions in an industrial environment is described. The purpose of this study was the offline programming automation of riveting machines for Airbus (A320-A340) panels and subassemblies. Providing the initial and goal configuration of the robot on the Airbus part, the method determines a collision free path taking into account computer aided design models of both the robot and Airbus parts. This method, based on the attractive potential field concept and the random motion technique was implemented on a robotic simulation software. The results obtained in planning trajectories for the industrial robot in a complex environment shows that the random motion method can be applied. The factors which limit the path planning performance are the time required for smoothing and the large number of anticollision tests required. The method can deal with all Airbus panels and subassemblies, and this approach could be extended to high degree of freedom industrial robots. ESA

(NASA-Case-NPO-19077-1-CU; NAS 1.71:NPO-19077-1-CU;
US-Patent-Appl-SN-223953) Avail: CASI HC A03/MF A01

This invention provides a new hierarchical approach for supervised neural learning of time dependent trajectories. The modular hierarchical methodology leads to architectures which are more structured than fully interconnected networks. The networks utilize a general feedforward flow of information and sparse recurrent connections to achieve dynamic effects. The advantages include the sparsity of units and connections, the modular

organization. A further advantage is that the learning is much more circumscribed learning than in fully interconnected systems. The present invention is embodied by a neural network including a plurality of neural modules each having a pre-established performance capability wherein each neural module has an output outputting present results of the performance capability and an input for changing the present results of the performance capabilitiy. For pattern recognition applications, the performance capability may be an oscillation capability producing a repeating wave pattern as the present results. In the preferred embodiment, each of the plurality of neural modules includes a pre-established capability portion and a performance adjustment portion connected to control the pre-established capability portion. Int-Patent-Class-G05B-19/42) Avail: US Patent and Trademark Office

The invention fulfills new goals for redundancy resolution based on manipulator dynamics and end-effector characteristics. These goals are accomplished by employing the recently developed configuration control approach. Redundancy resolution is achieved by controlling the joint inertia matrix of the end-effector mass matrix that affect the inertial torques or by reducing the joint torques due to gravity loading and payload. The manipulator mechanical-advantage and velocity-ratio are also used as performance measures to be improved by proper utilization of redundancy. Furthermore, end-effector compliance, sensitivity, and impulsive force at impact are introduced as redundancy resolution criteria. The new goals for redundancy resolution allow a more efficient utilization of the redundant joints based on the desired task requirements.

PULSE RESPONSE BASED MINIMUM TIME CONTROL OF FLEXIBLE STRUCTURES Ph.D. Thesis

Shih-Hsiao Mark Chang 1993 128 p
Avail: Univ. Microfilms Order No. DA9323361

A pulse response based control method is presented for solving minimum time flexible maneuver problems on the basis of the measured response to pulses applied in control inputs. Once the response of the structure to pulses in control inputs has been measured, the numerical optimization problem is solved to find the smallest number of time steps for which a control history exists that consists of a train of bounded pulses and results in desired outputs at the end of the control task. This method has the advantage that identification requirements are greatly reduced, because very little explicit knowledge of the system is needed. In fact, linear behavior of the structure is represented without modal truncation in terms of the pulse response measurements. However, for maneuver problems, nonlinear effects associated with rapid large-angle rotation are significant, but only in a few modes. These nonlinear effects are taken into account by explicitly modeling the response in a few of the lowest modes, so that the model order required for explicitly representing significant nonlinear behavior of the structure is much lower using this approach than if all linear behavior must be represented explicitly. The effect of actuator dynamics does not have to be modeled, because it is naturally represented in the measured pulse response. An efficient algorithm employing a quadratic programming code is developed to find the minimum time control of the structure. The effect of measurement noise on the accuracy of the pulse response based control method is investigated. Precise response of an example model which consists of a rigid hub with four identical uniform flexible appendages and tip masses is simulated by analytically separating the rigid body and flexible components of response. Then, the model is used to demonstrate the application of pulse response based control method to nonlinear large angle maneuver problems. A near minimum time pulse response based control method which requires virtually no real time computation is presented. A stable feedback control scheme which takes into account both nonlinear rotational stiffening effects and bounds on control inputs is also presented. The methods developed are demonstrated with numerical examples.

This invention is an adaptive neuron for use in neural network processors. The adaptive neuron participates in the supervised learning phase of operation on a co-equal basis with the synapse matrix elements by adaptively changing its gain in a similar manner to the change of weights in the synapse IO elements. In this manner, training time is decreased by as much as three orders of magnitude.

ROBOTIC HAND-EYE MOTOR LEARNING Ph.D. Thesis

Carl Frederick Ruoff 1993 223 p
Avail: Univ. Microfilms Order No. DA9325386

This thesis investigates the use of neural networks and nonlinear estimation in robotic motor learning. It presents a detailed experimental investigation of the performance and parametric sensitivity of resource-allocating neural networks along with a new learning algorithm that offers rapid adaptation and excellent accuracy. It also includes an appendix that relates feedforward neural networks to familiar mathematical ideas. In addition, it presents two learning hand-eye calibration systems, one based on neural networks and the other on nonlinear estimation. The network-based system learns to correct robot positioning errors arising from the use of nominal system kinematics, while the estimation-based system identifies the robot's kinematic parameters. Both systems employ the same two-link robot with stereo vision, and include noise and various other error sources. The network-based system is robust to all error sources considered, though noise naturally limits performance. The estimation-based system has significantly better performance when the robot and vision systems are well modeled, but is extremely sensitive to unmodeled error sources and noise. Finally, it presents a robot control system based on neural networks that learns to catch balls perfectly without requiring explicit programming or conventional controllers. It uses only feedforward pursuit motions learned through practice, and is initially incapable of even moving its arm in response to external stimuli. It learns to identify and control its pursuit movements, to identify and predict ball behavior, and, with the aid of advice from a critic, to modify its movement commands to improve catching success. The system, which incorporates information from visual, arm state, and drive force sensors, characterizes control situations using input/response pairs. This allows it to learn and respond to plant variations without requiring parametric models or parameter identification. It achieves robust execution by comparing predicted and observed behavior, using inconsistencies to trigger learning and behavioral change. Dissert. Abstr.

N94-29840 Cleveland State Univ., OH.
NEURAL NETWORK APPLICATION TO PARTICLE IMPACT NOISE DETECTION Ph.D. Thesis
Lois Jean Scaglione 1993 133 p
Avail: Univ. Microfilms Order No. DA9324929

Particle Impact Noise Detection (PIND) is a NASA developed test to determine the presence of loose particles inside the cavity of electronic parts. The loose particles may cause failures during launch conditions or in zero gravity. PIND testing analysis currently relies on audio static detection, visual interpretation of fluctuating oscilloscope signals, or a threshold detector which cannot distinguish between PIND failures and electric line transients. As a result, PIND testing is limited by human senses and is a subjective test with an accuracy level of less than 50 percent. In this research project, the PIND test is standardized and automated by digitizing the analog noise signal obtained from a PIND tester and analyzing the data using neural networks. Two types of neural networks were successfully trained and tested on the PIND data within 1 percent accuracy. A mathematical model of PIND testing was used to study the important characteristics of PIND testing and verified MIL-STD-883C Notice 8 Method 2020.7 and Method 2052. A validity study verified that particles were present in the electronic parts cavity when indicated by the PIND test. The results of this study indicate a significant improvement in the quality, reliability, and cost associated with PIND testing. Dissert. Abstr.

REINFORCEMENT LEARNING FOR ROBOTS USING NEURAL NETWORKS Ph.D. Thesis
Long-Ji Lin 1992 160 p
Avail: Univ. Microfilms Order No. DA9322750

Reinforcement learning agents are adaptive, reactive, and self-supervised. The aim of this dissertation is to extend the state of the art of reinforcement learning and enable its applications to complex robot learning problems. In particular, it focuses on two issues. First, learning from sparse and delayed reinforcement signals is hard and in general a slow process. Techniques for reducing learning time must be devised. Second, most existing reinforcement learning methods assume that the world is a Markov decision process. This assumption is too strong for many robot tasks of interest. This dissertation demonstrates how we can possibly overcome the slow learning problem and tackle non-Markovian environments, making reinforcement learning more practical for realistic robot tasks. Reinforcement learning can be naturally integrated with artificial neural networks to obtain high-quality generalization, resulting in a significant learning speedup. Neural networks are used in this dissertation, and they generalize effectively even in the presence of noise and a large number of binary and real-valued inputs. Reinforcement learning agents can save many learning trials by using an action model, which can be learned on-line. With a model, an agent can mentally experience the effects of its actions without actually executing them. Experience replay is a simple technique that implements this idea, and is shown to be effective in reducing the number of action executions required. Reinforcement learning agents can take advantage of instructive training instances provided by human teachers, resulting in a significant learning speedup. Teaching can also help learning agents avoid local optima during the search for optimal control. Simulation experiments indicate that even a small amount of teaching can save agents many learning trials. Reinforcement learning agents can significantly reduce learning time by hierarchical learning: they first solve elementary learning problems and then combine solutions to the elementary problems to solve a complex problem. Simulation experiments indicate that a robot with hierarchical learning can solve a complex problem, which otherwise is hardly solvable within a reasonable time. Reinforcement learning agents can deal with a wide range of non-Markovian environments by having a memory of their past. Three memory architectures are discussed. They work reasonably well for a variety of simple problems. One of them is also successfully applied to a nontrivial non-Markovian robot task. The results of this dissertation rely on computer simulation, including an agent operating in a dynamic and hostile environment and a mobile robot operating in a noisy and non-Markovian environment. The robot simulator is physically realistic. This dissertation concludes that it is possible to build artificial agents than can acquire complex control policies effectively by reinforcement learning. Dissert. Abstr.

ROBUST ADAPTIVE CONTROL AND FILTERING Ph.D. Thesis
Sanjeev Manubhai Naik 1992 173 p
Avail: Univ. Microfilms Order No. DA9305630

This thesis examines the robustness properties of various adaptive systems for control, filtering, and identification. These include the uniform boundedness or mean square boundedness of all closed-loop signals (robust boundedness, robust ultimate boundedness) and the closed-loop system tracking error performance in the presence (robust performance) and absence (nominal performance) of unmodeled dynamics, disturbances, and parameter time variations. The thesis is divided into three main parts. The first part considers the robustness of continuous-time adaptive control, the second part is concerned with robust adaptive control of discrete-time plants with time-varying parameters, and the third part deals with the robustness of stochastic adaptive algorithms that include parallel model adaptation problems such as output error identification, adaptive IIR filtering, adaptive feedforward control, and adaptive noise canceling, and ELS (extended least squares)-based adaptive control. In the first part, a continuous-time direct model reference adaptive controller (MRAC) using a gradient adaptation law based on parameter projection and 'extended regressor' normalization is proposed. Based on this, boundedness of all closed-loop signals is established for a continuous-time plant of arbitrary positive relative degree, in the presence of persistent bounded disturbances and small unmodeled dynamics that depend on both input and output, in possibly nonlinear or time-varying fashion. The deterioration of output tracking error performance is shown to be a continuous function of the sizes of the disturbance and unmodeled dynamics. In the second part, a discrete-time indirect adaptive pole-zero placement controller using a gradient adaptation law based on parameter projection and 'extended regressor' normalization is proposed for adaptive control of a discrete-time plant with time-varying parameters. Based on this, closed-loop boundedness and performance are established in the presence of disturbances, small unmodeled dynamics, and slow-in-the-mean parameter variations. In the third part, we consider the robustness of parameter projection-based parallel adaptation (output error-based) problems such as output error identification, adaptive IIR filtering, adaptive feedforward control, and adaptive noise canceling to unmodeled dynamics and to violation of statistical assumptions on the noise. We analyze vanishing gain algorithms. In the case of output error identification/adaptive IIR filtering, we also consider nonvanishing gain algorithms. It is found that the commonly imposed strict positive realness (SPR) condition can be relaxed in certain cases. We also consider the robustness of ELS-based adaptive control, which is an equation error-based approach. Dissert. Abstr.

NEURAL NETWORK BASED TIME-OPTIMAL CONTROL OF A MAGNETICALLY LEVITATED PRECISION POSITIONING SYSTEM
J. Redmond and S. Tucker 1994 9 p Presented at the 35th American Institute of Aeronautics and Astronautics (AIAA) Structures, Structural Dynamics and Materials Conference, Hilton Head, SC, 18-22 Apr. 1994
(Contract DE-AC04-94AL-85000)
(DE94-006573; SAND-94-0417C; CONF-940432-1) Avail: CASI HC A02/MF A01

This paper describes an application of artificial neural networks to the problem of time-optimal control of a magnetically levitated platen. The system of interest is a candidate technology for advanced photolithography machines used in the manufacturing of integrated circuits. The nonlinearities associated with magnetic levitation actuators preclude the direct application of classical time-optimal control methodologies for determining optimal rest-to-rest maneuver strategies. Instead, a computer simulation of the platen system is manipulated to provide a training set for an artificial neural network. The trained network provides optimal switching times for conducting one dimensional rest-to-rest maneuvers of the platen that incorporate the full nonlinear effects of the magnetic levitation actuators. Sample problems illustrate the effectiveness of the neural network based control as compared to traditional proportional-derivative control. DOE

SECOND ORDER NECESSARY CONDITIONS IN OPTIMAL CONTROL Ph.D. Thesis
Harry Huiheng Zheng May 1993 110 p

(ISBN-0-315-85443-X; CTN-94-61160) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Second order necessary conditions for the standard deterministic optimal control problem are presented, without conventional regularity assumptions. Three different advances in second-order theory are reported. In a study of conjugate points in smooth optimal control, a set of conditions is described under which the second variation along an external trajectory is certain to be negative. When these are satisfied, they identify a certain point in the basic interval as a generalized conjugate point (GCP). GCP's include all conjugate points in the classical sense and all points where the Legendre condition is violated. GCP's were also found in many problems left unresolved in the literature, and it is deduced that the associated extremals are not optimal. A second order tangent set is then used to predict second order variations along a trajectory to a different inclusion. A generalized form is obtained of the statement that the second variation associated with a minimum point is nonnegative. Finally, Rockafellar's theory of epi differentiability is applied to integral functionals. Using Attouch's theorem, it is shown that certain nonconvex integral functionals of interest in optimal control are twice epi differentiable. From this the necessary conditions of optimality are deduced for problems without endpoint constraints.

A LATERAL INHIBITION NEURAL NETWORK THAT EMULATES A WINNER-TAKES-ALL ALGORITHM

B. Krekelberg and J. N. Kok Dec. 1992 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)
(RUU-CS-92-46; ETN-94-95636) Avail: CASI HC A02

The conditions under which a lateral inhibition type network with binary neurons selects a unit which receives the maximal input are determined. It is shown that the lateral interaction between two neurons needs to be tuned to a critical value. The resulting neural network is a local implementation of the first phase of the Kohonen learning algorithm. ESA

A MULTISCALE APPROACH TO IMAGE SEGMENTATION USING KOHONEN NETWORKS

S. Haring, M. A. Viergever, and J. N. Kok Feb. 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(RUU-CS-93-06; ETN-94-95643) Avail: CASI HC A03

An approach to multiscale image segmentation, based on pixel classification by means of a Kohonen network, is developed. An image is described by assigning a feature pattern to each pixel, consisting of a scaled family of differential geometrical invariant features. The invariant feature pattern representation of a training image is input to a Kohonen network, in order to obtain a description of the feature space in terms of so called prototypical feature patterns (the weight vectors of the network). Supervised labeling of these prototypical feature patterns may be accomplished using classes derived from an a priori segmentation of the training image. Any image similar to the training image can be segmented by comparing the feature pattern representation of each pixel with all weight vectors, and assigning each pixel the class of the best matching weight vector. The benefit of applying features at multiple scales, and the effects of first and second order information on the results, were evaluated. ESA

A model to determine performance metrics for an intelligent network (IN) is presented. The model was constructed using queueing network theory. The model can be solved for a certain configuration by either simulation or analytical calculation. A simulation model was built using the SIMSCRIPT language. The simulation model was verified by analytical calculations. This verification indicates that the simulation model was correct. The simulation model provides, besides performance metrics like utilization and average response times, estimations of response time distributions. These distributions may be very useful in order to assure a certain quality of service towards PTT customers. Using the model it is possible to get some hands on experience for capacities needed in the IN, guaranteeing a good quality of service. With simulation it is possible to get online experience with the parametrizing of the IN. The effect of adding a new service or installing new equipment can be shown. ESA

Constraints are relaxed and the analysis of the class of open queueing networks are extended with general arrival processes and general service time distributions, considered in Queueing Network Analyzer (QNA) software package. In order to allow for the modeling of, for example, segmentation and reassembly processes in communication networks, two new types of nodes are introduced. A customer creation node generated a certain number of departing customers upon arrival of one single customer. A customer combination node combines a certain number of arriving customers into one departing customer, which departs as soon as all the originating customers have arrived. Both the numbers of customers to be created and the number of customers to be combined are random variables. The analysis of the nodes are presented in the context of QNA. The feasibility and the accuracy of the extension is illustrated by example queueing networks. ESA

A PROBABILISTIC APPROACH TO MOTION PLANNING FOR CAR-LIKE ROBOTS

Petr Svestka Apr. 1993 88 p Sponsored in part by EEC, and Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)
(RUU-CS-93-18; ETN-94-95655) Avail: CASI HC A05

A study aimed at finding a collision free path in an environment containing some obstacles for a given robot from start configuration to goal configuration is presented. Solid robots which move in a planar environment are addressed; the technique described can be applied to other robot types. Two versions of the random motion planning method are described: one based on an undirected graph, and one based on a directed one. An explanation as to how the constraints of the robot prescribe whether the underlying graph should be directed or not is given. Attention is paid to the way in which edges should be added to the underlying graph, and how to prevent adding useless edges. A number of heuristic techniques for adding via-points in a smarter way then just fully randomly are described. Two methods for smoothing the paths generated by the basic algorithm are given. Formal definitions of car-like robots and paths respecting their nonholonomic constraints are given and the described techniques are applied to them. ESA

A DIRECT DIGITAL CONTROL-LAW SYNTHESIS IN THE w-DOMAIN:

W-SYNTHESIS METHODOLOGY Ph.D. Thesis
Cheolkeun Ha 1993 206 p
Avail: Univ. Microfilms Order No. DA9326360

In this dissertation, a new framework for direct digital control-law synthesis of a typical single-rate sampled-data system is presented. The synthesis procedure is conducted in the w-domain for design and analysis of sampled-data systems. A general procedure of direct digital controller synthesis in the w-domain is proposed and it is called the W-synthesis procedure. In the synthesis procedure, a generalized root-locus method in the w-domain is presented. Based on the W-synthesis procedure, an optimal W-synthesis method is developed to solve the general class of H2 optimal control problems for sampled-data systems using a numerical search algorithm applied to continuous-time optimal control problems. The H2 optimal control problem is extended to address computation time-delay at the control action. A (s,w)-hybrid method for frequency response analysis is developed that takes into account aliasing frequency components. An extended-optimal W-synthesis (EOW-synthesis) method is developed to allow a convenient design of discrete-time controller defined in the z-domain. To synthesize robust digital control-laws to plant parameter variations, the EOW-synthesis procedure makes use of a multi-objective criterion in the setting of multiple plant conditions. The EOW-synthesis method is implemented in the numerical search algorithm 'Wsandy' which is a modification of the algorithm SANDY developed for continuous-time H2 optimal control problems. The optimal W-synthesis methods have been applied to a pitch augmentation design of B767 airplane, a benchmark problem of a two-mass-spring system with computation time-delay and the control of a flexible two-link robot manipulator. CONFERENCE ON INTELLIGENT ROBOTICS IN FIELD, FACTORY, SERVICE, AND SPACE (CIRFFSS 1994), VOLUME 1
Jon D. Erickson, ed. Mar. 1994 472 p Conference held in Houston, TX, 21-24 Mar. 1994; sponsored by NASA, Johnson Space Center, AIAA, IEEE Robotics and Automation Society, NSRA, RIA, SOIE, and ISA
(NASA-CP-3251; S-754-Vol-1; NAS 1.55:3251) Avail: CASI HC A20/MF A04

The AIAA/NASA Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS '94) was originally proposed because of the strong belief that America's problems of global economic competitiveness and job creation and preservation can partly be solved by the use of intelligent robotics, which are also required for human space exploration missions. Individual sessions addressed nuclear industry, agile manufacturing, security/building monitoring, on-orbit applications, vision and sensing technologies, situated control and low-level control, robotic systems architecture, environmental restoration and waste management, robotic remanufacturing, and healthcare applications. For individual titles, see N94-30527 through N94-30584.

A case is made for strategic investment in intelligent robotics as a part of the solution to the problem of improved global competitiveness for U.S. manufacturing, a critical industrial sector. Similar cases are made for strategic investments in intelligent robotics for field applications, construction, and service industries such as health care. The scope of the country's problems and needs is beyond the capability of the private sector alone, government alone, or academia alone to solve independently of the others. National cooperative programs in intelligent robotics are needed with the private sector supplying leadership direction and aerospace and non-aerospace industries conducting the development. Some necessary elements of such programs are outlined. The National Aeronautics and Space Administration (NASA) and the Lyndon B. Johnson Space Center (JSC) can be key players in such national cooperative programs in intelligent robotics for several reasons: (1) human space exploration missions require supervised intelligent robotics as enabling tools and, hence must develop supervised intelligent robotic systems; (2) intelligent robotic technology is being developed for space applications at JSC (but has a strong crosscutting or generic flavor) that is advancing the state of the art and is producing both skilled personnel and adaptable developmental infrastructure such as integrated testbeds; and (3) a NASA JSC Technology Investment Program in Robotics has been proposed based on commercial partnerships and collaborations for precompetitive, dual-use developments. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 12-20 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1177-CP) Avail: CASI HC A02/MF A04

This paper describes research on the ARK (Autonomous Mobile Robot in a Known Environment) project. The technical objective of the project is to build a robot that can navigate in a complex industrial environment using maps with permanent structures. The environment is not altered in any way by adding easily identifiable beacons and the robot relies on naturally occurring objects to use as visual landmarks for navigation. The robot is equipped with various sensors that can detect unmapped obstacles, landmarks and objects. In this paper we describe the robot's industrial environment, it's architecture, a novel combined range and vision sensor and our recent results in controlling the robot in the real-time detection of objects using their color and in the processing of the robot's range and vision sensor data for navigation. BIOLOGICALLY-INSPIRED HEXAPOD ROBOT DESIGN AND SIMULATION
Kenneth S. Espenschied and Roger D. Quinn *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 21-28 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1178-CP) Avail: CASI HC A02/MF A04

The design and construction of a biologically-inspired hexapod robot is presented. A previously developed simulation is modified to include models of the DC drive motors, the motor driver circuits and their transmissions. The application of this simulation to the design and development of the robot is discussed. The mechanisms thought to be responsible for the leg coordination of the walking stick insect were previously applied to control the straight-line locomotion of a robot. We generalized these rules for a robot walking on a plane. This biologically-inspired control strategy is used to control the robot in simulation. Numerical results show that the general body motion and performance of the simulated robot is similar to that of the robot based on our preliminary experimental results. Author

ODYSSEUS AUTONOMOUS WALKING ROBOT: THE LEG/ARM DESIGN
N. G. Bourbakis, M. Maas, A. Tascillo, and C. Vandewinckel *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 29-36 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1180-CP) Avail: CASI HC A02/MF A04

ODYSSEUS is an autonomous walking robot, which makes use of three wheels and three legs for its movement in the free navigation space. More specifically, it makes use of its autonomous wheels to move around in an environment where the surface is smooth and not uneven. However, in the case that there are small height obstacles, stairs, or small height unevenness in the navigation environment, the robot makes use of both wheels and legs to travel efficiently. In this paper we present the detailed hardware design and the simulated behavior of the extended leg/arm part of the robot, since it plays a very significant role in the robot actions (movements, selection of objects, etc.). In particular, the leg/arm consists of three major parts: The first part is a pipe attached to the robot base with a flexible 3-D joint. This pipe has a rotated bar as an extended part, which terminates in a 3-D flexible joint. The second part of the leg/arm is also a pipe similar to the first. The extended bar of the second part ends at a 2-D joint. The last part of the leg/arm is a clip-hand. It is used for selecting several small weight and size objects, and when it is in a 'closed' mode, it is used as a supporting part of the robot leg. The entire leg/arm part is controlled and synchronized by a microcontroller (68CH11) attached to the robot base. Author

VAS: A VISION ADVISOR SYSTEM COMBINING AGENTS AND OBJECT-ORIENTED DATABASES
James L. Eilbert, William Lim, Jay Mendelsohn, Ron Braun, and Michael Yearwood *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 37-46 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1181-CP) Avail: CASI HC A02/MF A04

A model-based approach to identifying and finding the orientation of non-overlapping parts on a tray has been developed. The part models contain both exact and fuzzy descriptions of part features, and are stored in an object-oriented database. Full identification of the parts involves several interacting tasks each of which is handled by a distinct agent. Using fuzzy information stored in the model allowed part features that were essentially at the noise level to be extracted and used for identification. This was done by focusing attention on the portion of the part where the feature must be found if the current hypothesis of the part ID is correct. In going from one set of parts to another the only thing that needs to be changed is the database of part models. This work is part of an effort in developing a Vision Advisor System (VAS) that combines agents and objected-oriented databases. Author

APPLICATION OF THE MODULAR AUTOMATED RECONFIGURABLE ASSEMBLY SYSTEM (MARAS) CONCEPT TO ADAPTABLE VISION GAUGING AND PARTS FEEDING
Andre Bernard By, Ken Caron, Michael Rothenberg, and Vic Sales *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 47-55 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1182-CP) Avail: CASI HC A02/MF A04

This paper presents the first phase results of a collaborative effort between university researchers and a flexible assembly systems integrator to implement a comprehensive modular approach to flexible assembly automation. This approach, named MARAS (Modular Automated Reconfigurable Assembly System), has been structured to support multiple levels of modularity in terms of both physical components and system control functions. The initial focus of the MARAS development has been on parts gauging and feeding operations for cylinder lock assembly. This phase is nearing completion and has resulted in the development of a highly configurable system for vision gauging functions on a wide range of small components (2 mm to 100 mm in size). The reconfigurable concepts implemented in this adaptive Vision Gauging Module (VGM) are now being extended to applicable aspects of the singulating, selecting, and orienting functions required for the flexible feeding of similar mechanical components and assemblies. AGILE MANUFACTURING: THE FACTORY OF THE FUTURE
Joseph M. Loibl and Terry A. Bossieux *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 56-62 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1184-CP) Avail: CASI HC A02/MF A04

The factory of the future will require an operating methodology which effectively utilizes all of the elements of product design, manufacturing and delivery. The process must respond rapidly to changes in product demand, product mix, design changes or changes in the raw materials. To achieve agility in a manufacturing operation, the design and development of the manufacturing processes must focus on customer satisfaction. Achieving greatest results requires that the manufacturing process be considered from product concept through sales. This provides the best opportunity to build a quality product for the customer at a reasonable rate. The primary elements of a manufacturing system include people, equipment, materials, methods and the environment. The most significant and most agile element in any process is the human resource. Only with a highly trained, knowledgeable work force can the proper methods be applied to efficiently process materials with machinery which is predictable, reliable and flexible. This paper discusses the affect of each element on the development of agile manufacturing systems. Author

CONFESSIONS OF A ROBOT LOBOTOMIST
R. Marc Gottshall *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 63-72 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1185-CP) Avail: CASI HC A02/MF A04

Since its inception, numerically controlled (NC) machining methods have been used throughout the aerospace industry to mill, drill, and turn complex shapes by sequentially stepping through motion programs. However, the recent demand for more precision, faster feeds, exotic sensors, and branching execution have existing computer numerical control (CNC) and distributed numerical control (DNC) systems running at maximum controller capacity. Typical disadvantages of current CNC's include fixed memory capacities, limited communication ports, and the use of multiple control languages. The need to tailor CNC's to meet specific applications, whether it be expanded memory, additional communications, or integrated vision, often requires replacing the original controller supplied with the commercial machine tool with a more powerful and capable system. This paper briefly describes the process and equipment requirements for new controllers and their evolutionary implementation in an aerospace environment. The process of controller retrofit with currently available machines is examined, along with several case studies and their computational and architectural implications. Author

INTEGRATION OF VISION AND ROBOTIC WORKCELL
T. A. Bossieux *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 73-77 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1186-CP) Avail: CASI HC A01/MF A04

The paper discusses the incorporation of vision into a robotic cell to obtain cell status information and use this information to influence the robot operation. It discusses both mechanical and informational solutions to the operational issues which are present. The cell uses a machine vision system to determine information about part presence in the shipping tray, part location in the tray, and tray orientation. The vision system's edge detector algorithm is used to identify the orientation of the packing trays. In addition, different vision tools are used to determine if parts are present in the trays based on the unique configuration of the individual parts. The mechanical solutions discuss the handling of medium weight (10 - 25 lb.) parts at an average cycle time of 3.1 seconds per part. The robot gripper must handle 33 different models, three identical parts at a time. This is accomplished by using stacks of rotary actuators and slides between the stacks. Author

MEETING THE CHALLENGES OF INSTALLING A MOBILE ROBOTIC SYSTEM
Celeste DeCorte *In* NASA. Johnson Space Center, Conference on

Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 78-81 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1187-CP) Avail: CASI HC A01/MF A04

The challenges of integrating a mobile robotic system into an application environment are many. Most problems inherent to installing the mobile robotic system fall into one of three categories: (1) the physical environment - location(s) where, and conditions under which, the mobile robotic system will work; (2) the technological environment - external equipment with which the mobile robotic system will interact; and (3) the human environment - personnel who will operate and interact with the mobile robotic system. The successful integration of a mobile robotic system into these three types of application environment requires more than a good pair of pliers. The tools for this job include: careful planning, accurate measurement data (as-built drawings), complete technical data of systems to be interfaced, sufficient time and attention of key personnel for training on how to operate and program the robot, on-site access during installation, and a thorough understanding and appreciation - by all concerned - of the mobile robotic system's role in the security mission at the site, as well as the machine's capabilities and limitations. Patience, luck, and a sense of humor are also useful tools to keep handy during a mobile robotic system installation. This paper will discuss some specific examples of problems in each of three categories, and explore approaches to solving these problems. The discussion will draw from the author's experience with on-site installations of mobile robotic systems in various applications. Most of the information discussed in this paper has come directly from knowledge learned during installations of Cybermotion's SR2 security robots. A large part of the discussion will apply to any vehicle with a drive system, collision avoidance, and navigation sensors, which is, of course, what makes a vehicle autonomous. And it is with these sensors and a drive system that the installer must become familiar in order to foresee potential trouble areas in the physical, technical, and human environment. Author

(AIAA Paper 94-1189-CP) Avail: CASI HC A01/MF A04

In this paper, we discuss cooperative work by Oak Ridge National Laboratory and Remotec, Inc., to automate components of the operator's workload using Remotec's Andros telerobot, thereby providing an enhanced user interface which can be retrofit to existing fielded units as well as being incorporated into new production units. Remotec's Andros robots are presently used by numerous electric utilities to perform tasks in reactors where substantial exposure to radiation exists, as well as by the armed forces and numerous law enforcement agencies. The automation of task components, as well as the video graphics display of the robot's position in the environment, will enhance all tasks performed by these users, as well as enabling performance in terrain where the robots cannot presently perform due to lack of knowledge about, for instance, the degree of tilt of the robot. Enhanced performance of a successful industrial mobile robot leads to increased safety and efficiency of performance in hazardous environments. The addition of these capabilities will greatly enhance the utility of the robot, as well as its marketability. Author

TECHNOLOGY TRANSFER AND EVALUATION FOR SPACE STATION TELEROBOTICS
Charles R. Price, LeBarian Stokes, and Myron A. Diftler *In its* Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 103-111 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1190-CP) Avail: CASI HC A02/MF A04

The international space station (SS) must take advantage of advanced telerobotics in order to maximize productivity and safety and to reduce maintenance costs. The Automation and Robotics Division at the NASA Lyndon B. Johnson Space Center (JSC) has designed, developed, and constructed the Automated Robotics Maintenance of Space Station (ARMSS) facility for the purpose of transferring and evaluating robotic technology that will reduce SS operation costs. Additionally, JSC had developed a process for expediting the transfer of technology from NASA research centers and evaluating these technologies in SS applications. Software and hardware system developed at the research centers and NASA sponsored universities are currently being transferred to JSC and integrated into the ARMSS for flight crew personnel testing. These technologies will be assessed relative to the SS baseline, and, after refinements, those technologies that provide significant performance improvements will be recommended as upgrades to the SS. Proximity sensors, vision algorithms, and manipulator controllers are among the systems scheduled for evaluation. Author (revised)

SPACE FLIGHT MANIPULATOR TECHNOLOGIES AND REQUIREMENTS FOR THE NASA FLIGHT TELEROBOTIC SERVICER (FTS)
John T. Chladek and William M. Craver *In its* Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 112-122 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1191-CP) Avail: CASI HC A03/MF A04

NASA Headquarters' Office of Advanced Concepts and Technology (OACT) joined efforts with Johnson Space Center's (JSC) Automation and Robotics Division and Langley Research Center's (LaRC) Information Systems Division to capture the technologies developed during the cancelled NASA Flight Telerobotic Servicer (FTS) program planned for use on Space Station Freedom. The recent FTS technology capture effort completed the build and testing of one flight qualifiable FTS manipulator, deliverable to JSC's Automation & Robotics Division for environmental testing. The many robotic technologies developed to meet the 30 year space environment design requirements are discussed in this paper. The manipulator properties were to allow positioning control to one thousandths of an inch, with zero actuator backlash over a temperature range of -50 to +95 C, and were to include impedance control and inertial decoupling. Safety and reliability

requirements are discussed that were developed to allow a thirty year life in space with minimum maintenance. The system had to meet the safety requirements for hazardous payloads for operation in the shuttle payload bay during demonstration test flights prior to station use. A brief description is contained on an orbiter based robotic experiment and operational application using the dexterous FTS manipulator operating on the end of the shuttle remote manipulator systems (SRMS) from ground control.

A SPACE STATION ROBOT WALKER AND ITS SHARED CONTROL SOFTWARE
Yangsheng Xu, Ben Brown, Shigeru Aoki, and Tetsuji Yoshida *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 123-130 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1192-CP) Avail: CASI HC A02/MF A04

In this paper, we first briefly overview the update of the self-mobile space manipulator (SMSM) configuration and testbed. The new robot is capable of projecting cameras anywhere interior or exterior of the Space Station Freedom (SSF), and will be an ideal tool for inspecting connectors, structures, and other facilities on SSF. Experiments have been performed under two gravity compensation systems and a full-scale model of a segment of SSF. This paper presents a real-time shared control architecture that enables the robot to coordinate autonomous locomotion and teleoperation input for reliable walking on SSF. Autonomous locomotion can be executed based on a CAD model and off-line trajectory planning, or can be guided by a vision system with neural network identification. Teleoperation control can be specified by a real-time graphical interface and a free-flying hand controller. SMSM will be a valuable assistant for astronauts in inspection and other EVA missions. TECHNOLOGY FOR ROBOTIC SURFACE INSPECTION IN SPACE
Richard Volpe and J. Balaram *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 131-141 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1193-CP) Avail: CASI HC A03/MF A04

This paper presents on-going research in robotic inspection of space platforms. Three main areas of investigation are discussed: machine vision inspection techniques, an integrated sensor end-effector, and an orbital environment laboratory simulation. Machine vision inspection utilizes automatic comparison of new and reference images to detect on-orbit induced damage such as micrometeorite impacts. The cameras and lighting used for this inspection are housed in a multisensor end-effector, which also contains a suite of sensors for detection of temperature, gas leaks, proximity, and forces. To fully test all of these sensors, a realistic space platform mock-up has been created, complete with visual, temperature, and gas anomalies. Further, changing orbital lighting conditions are effectively mimicked by a robotic solar simulator. In the paper, each of these technology components will be discussed, and experimental results are provided.

The work on the serpentine inspection system at JPL is described. The configuration of the inspection system consists of 20 degrees of freedom in total. In particular, the design and development of the serpentine micromanipulator end-effector tool which has 12 degrees of freedom is described. The inspection system is used for application in JPL's Remote Surface Inspection project and as a research tool in redundant manipulator control. Author (revised)

FREE-FLOATING DUAL-ARM ROBOTS FOR SPACE ASSEMBLY
Sunil Kumar Agrawal and M. Y. Chen *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 149-157 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1195-CP) Avail: CASI HC A02/MF A04

Freely moving systems in space conserve linear and angular momentum. As moving systems collide, the velocities get altered due to transfer of momentum. The development of strategies for assembly in a free-floating work environment requires a good understanding of primitives such as self motion of the robot, propulsion of the robot due to onboard thrusters, docking of the robot, retrieval of an object from a collection of objects, and release of an object in an object pool. The analytics of such assemblies involve not only kinematics and rigid body dynamics but also collision and impact dynamics of multibody systems. In an effort to understand such assemblies in zero gravity space environment, we are currently developing at Ohio University a free-floating assembly facility with a dual-arm planar robot equipped with thrusters, a free-floating material table, and a free-floating assembly table. The objective is to pick up workpieces from the material table and combine them into prespecified assemblies. This paper presents analytical models of assembly primitives and strategies for overall assembly. A computer simulation of an assembly is developed using the analytical models. The experiment facility will be used to verify the theoretical predictions. Author (revised)

(AIAA Paper 94-1196-CP) Avail: CASI HC A02/MF A04

In this paper, we propose a design of an active vision system for intelligent robot application purposes. The system has the degrees of freedom of pan, tilt, vergence, camera height adjustment, and baseline adjustment with a hierarchical control system structure. Based on this vision system, we discuss two problems involved in the binocular gaze stabilization process: fixation point selection and vergence disparity extraction. A hierarchical approach to determining point of fixation from potential gaze targets using evaluation function representing human visual behavior to outside stimuli is suggested. We also characterize different visual tasks in two cameras for vergence control purposes, and a phase-based method based on binarized images to extract vergence disparity for vergence control is presented. A control algorithm for vergence control is discussed. Author (revised)

VISION BASED OBJECT POSE ESTIMATION FOR MOBILE ROBOTS
Annie Wu, Clint Bidlack, Arun Katkere, Roy Feague, and Terry Weymouth *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 168-174 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1197-CP) Avail: CASI HC A02/MF A04

Mobile robot navigation using visual sensors requires that a robot be able to detect landmarks and obtain pose information from a camera image. This paper presents a vision system for finding man-made markers of known size and calculating the pose of these markers. The algorithm detects and identifies the markers using a weighted pattern matching template. Geometric constraints are then used to calculate the position of the markers relative to the robot. The selection of geometric constraints comes from the typical pose of most man-made signs, such as the sign standing vertical and the dimensions of known size. This system has been tested successfully on a wide range of real images. Marker detection is reliable, even in cluttered environments, and under certain marker orientations, estimation of the orientation has proven accurate to within 2 degrees, and distance estimation to within 0.3 meters. UNSUPERVISED TEXTURE IMAGE SEGMENTATION BY IMPROVED NEURAL NETWORK ART2
Zhiling Wang, G. Sylos Labini, R. Mugnuolo, and Marco DeSario *In*

NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 175-180 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1199-CP) Avail: CASI HC A02/MF A04

We here propose a segmentation algorithm of texture image for a computer vision system on a space robot. An improved adaptive resonance theory (ART2) for analog input patterns is adapted to classify the image based on a set of texture image features extracted by a fast spatial gray level dependence method (SGLDM). The nonlinear thresholding functions in input layer of the neural network have been constructed by two parts: firstly, to reduce the effects of image noises on the features, a set of sigmoid functions is chosen depending on the types of the feature; secondly, to enhance the contrast of the features, we adopt fuzzy mapping functions. The cluster number in output layer can be increased by an autogrowing mechanism constantly when a new pattern happens. Experimental results and original or segmented pictures are shown, including the comparison between this approach and K-means algorithm. The system written in C language is performed on a SUN-4/330 sparc-station with an image board IT-150 and a CCD camera. Author (revised)

Microwave Vision (MV), a concept originally developed in 1985, could play a significant role in the solution to robotic vision problems. Originally our Microwave Vision concept was based on a pattern matching approach employing computer based stored replica correlation processing. Artificial Neural Network (ANN) processor technology offers an attractive alternative to the correlation processing approach, namely the ability to learn and to adapt to changing environments. This paper describes the Microwave Vision concept, some initial ANN-MV experiments, and the design of an ANN-MV system that has led to a second patent disclosure in the robotic vision field. Author

AN ELECTROMAGNETIC NONCONTACTING SENSOR FOR THICKNESS MEASUREMENT IN A DISPERSIVE MEDIUM
Robert L. Chufo *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 190-194 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1200-CP) Avail: CASI HC A01/MF A04

This paper describes a general purpose imaging technology developed by the U.S. Bureau of Mines (USBM) that, when fully implemented, will solve the general problem of 'seeing into the earth.' A first-generation radar coal thickness sensor, the RCTS-1, has been developed and field-tested in both underground and highwall mines. The noncontacting electromagnetic technique uses spatial modulation created by moving a simple sensor antenna in a direction along each axis to be measured while the complex reflection coefficient is measured at multiple frequencies over a two-to-one bandwidth. The antenna motion imparts spatial modulation to the data that enables signal processing to solve the problems of media, target, and antenna dispersion. Knowledge of the dielectric constant of the media is not necessary because the electrical properties of the media are determined automatically along with the distance to the target and thickness of each layer of the target. The sensor was developed as a navigation guidance sensor to accurately detect the coal/noncoal interface required for the USBM computer-assisted mining machine program. Other mining applications include the location of rock fractures, water-filled voids, and abandoned gas wells. These hazards can be detected in advance of the mining operation. This initiating technology is being expanded into a full three-dimensional (3-D) imaging system that will have applications in both the underground and surface environment. Author

PERCEPTION SYSTEM AND FUNCTIONS FOR AUTONOMOUS NAVIGATION IN A NATURAL ENVIRONMENT
Raja Chatila, Michel Devy, Simon Lacroix, and Matthieu Herrb *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 195-205 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1201-CP) Avail: CASI HC A03/MF A04

This paper presents the approach, algorithms, and processes we developed for the perception system of a cross-country autonomous robot. After a presentation of the tele-programming context we favor for intervention robots, we introduce an adaptive navigation approach, well suited for the characteristics of complex natural environments. This approach lead us to develop a heterogeneous perception system that manages several different terrain representatives. The perception functionalities required during navigation are listed, along with the corresponding representations we consider. The main perception processes we developed are presented. They are integrated within an on-board control architecture we developed. First results of an ambitious experiment currently underway at LAAS are then presented. Author

FUZZY LOGIC BASED ROBOTIC CONTROLLER
F. Attia and M. Upadhyaya *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 206-211 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1202-CP) Avail: CASI HC A02/MF A04

Existing Proportional-Integral-Derivative (PID) robotic controllers rely on an inverse kinematic model to convert user-specified cartesian trajectory coordinates to joint variables. These joints experience friction, stiction, and gear backlash effects. Due to lack of proper linearization of these effects, modern control theory based on state space methods cannot provide adequate control for robotic systems. In the presence of loads, the dynamic behavior of robotic systems is complex and nonlinear, especially where mathematical modeling is evaluated for real-time operators. Fuzzy Logic Control is a fast emerging alternative to conventional control systems in situations where it may not be feasible to formulate an analytical model of the complex system. Fuzzy logic techniques track a user-defined trajectory without having the host computer to explicitly solve the nonlinear inverse kinematic equations. The goal is to provide a rule-based approach, which is closer to human reasoning. The approach used expresses end-point error, location of manipulator joints, and proximity to obstacles as fuzzy variables. The resulting decisions are based upon linguistic and non-numerical information. This paper presents a solution to the conventional robot controller which is independent of computationally intensive kinematic equations. Computer simulation results of this approach as obtained from software implementation are also discussed. Author

VEHICLE FOLLOWING CONTROLLER DESIGN FOR AUTONOMOUS INTELLIGENT VEHICLES
C. C. Chien, M. C. Lai, and R. Mayr *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 212-222 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1203-CP) Avail: CASI HC A03/MF A04

A new vehicle following controller is proposed for autonomous intelligent vehicles. The proposed vehicle following controller not only provides smooth transient maneuvers for unavoidable nonzero initial conditions but also guarantees the asymptotic platoon stability without the availability of feedforward information. Furthermore, the achieved asymptotic platoon stability is shown to be robust to sensor delays and an upper bound for the allowable sensor delays is also provided in this paper. Author

The success of every mobile robot application hinges on the ability to

navigate robustly in the real world. The problem of robust navigation is separable from the challenges faced by any particular robot application. We offer the Real-World Navigator as a solution architecture that includes a path planner, a map-based localizer, and a motion control loop that combines reactive avoidance modules with deliberate goal-based motion. Our architecture achieves a high degree of reliability by maintaining and reasoning about an explicit description of positional uncertainty. We provide two implementations of real-world robot systems that incorporate the Real-World Navigator. The Vagabond Project culminated in a robot that successfully navigated a portion of the Stanford University campus. The Scimmer project developed successful entries for the AIAA 1993 Robotics Competition, placing first in one of the two contests entered. Author

A STREAMLINED SOFTWARE ENVIRONMENT FOR SITUATED SKILLS

Sophia T. Yu, Marc G. Slack, and David P. Miller *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 233-239 (For primary document see N94-30526 08-63)

(AIAA Paper 94-1205-CP) Avail: CASI HC A02/MF A04

This paper documents a powerful set of software tools used for developing situated skills. These situated skills form the reactive level of a three-tiered intelligent agent architecture. The architecture is designed to allow these skills to be manipulated by a task level engine which is monitoring the current situation and selecting skills necessary for the current task. The idea is to coordinate the dynamic activations and deactivations of these situated skills in order to configure the reactive layer for the task at hand. The heart of the skills environment is a data flow mechanism which pipelines the currently active skills for execution. A front end graphical interface serves as a debugging facility during skill development and testing. We are able to integrate skills developed in different languages into the skills environment. The power of the skills environment lies in the amount of time it saves for the programmer to develop code for the reactive layer of a robot. Author

SITUATIONAL REACTION AND PLANNING

John Yen and Nathan Pfluger *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 240-245 (For primary document see N94-30526 08-63)

(AIAA Paper 94-1206-CP) Avail: CASI HC A02/MF A04

One problem faced in designing an autonomous mobile robot system is that there are many parameters of the system to define and optimize. While these parameters can be obtained for any given situation determining what the parameters should be in all situations is difficult. The usual solution is to give the system general parameters that work in all situations, but this does not help the robot to perform its best in a dynamic environment. Our approach is to develop a higher level situation analysis module that adjusts the parameters by analyzing the goals and history of sensor readings. By allowing the robot to change the system parameters based on its judgement of the situation, the robot will be able to better adapt to a wider set of possible situations. We use fuzzy logic in our implementation to reduce the number of basic situations the controller has to recognize. For example, a situation may be 60 percent open and 40 percent corridor, causing the optimal parameters to be somewhere between the optimal settings for the two extreme situations. Author

BUILDING BRAINS FOR BODIES

Rodney Allen Brooks and Lynn Andrea Stein *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 253-263 (For primary document see N94-30526 08-63)

(AIAA Paper 94-1208-CP) Avail: CASI HC A03/MF A04

We describe a project to capitalize on newly available levels of computational resources in order to understand human cognition. We will build an integrated physical system including vision, sound input and output, and dextrous manipulation, all controlled by a continuously operating large scale parallel MIMD computer. The resulting system will learn to 'think' by building on its bodily experiences to accomplish progressively more abstract tasks. Past experience suggests that in attempting to build such an integrated system we will have to fundamentally change the way artificial intelligence, cognitive science, linguistics, and philosophy think about the organization of intelligence. We expect to be able to better reconcile the theories that will be developed with current work in neuroscience. Author

OBJECT-BASED TASK-LEVEL CONTROL: A HIERARCHICAL CONTROL ARCHITECTURE FOR REMOTE OPERATION OF SPACE ROBOTS

H. D. Stevens, E. S. Miles, S. J. Rock, and R. H. Cannon *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 264-273 (For primary document see N94-30526 08-63)

(AIAA Paper 94-1209-CP) Avail: CASI HC A02/MF A04

Expanding man's presence in space requires capable, dexterous robots capable of being controlled from the Earth. Traditional 'hand-in-glove' control paradigms require the human operator to directly control virtually every aspect of the robot's operation. While the human provides excellent judgment and perception, human interaction is limited by low bandwidth, delayed communications. These delays make 'hand-in-glove' operation from Earth impractical. In order to alleviate many of the problems inherent to remote operation, Stanford University's Aerospace Robotics Laboratory (ARL) has developed the Object-Based Task-Level Control architecture. Object-Based Task-Level Control (OBTLC) removes the burden of teleoperation from the human operator and enables execution of tasks not possible with current techniques. OBTLC is a hierarchical approach to control where the human operator is able to specify high-level, object-related tasks through an intuitive graphical user interface. Infrequent task-level command replace constant joystick operations, eliminating communications bandwidth and time delay problems. The details of robot control and task execution are handled entirely by the robot and computer control system. The ARL has implemented the OBTLC architecture on a set of Free-Flying Space Robots. The capability of the OBTLC architecture has been demonstrated by controlling the ARL Free-Flying Space Robots from NASA Ames Research Center. Author

TASK-LEVEL CONTROL FOR AUTONOMOUS ROBOTS

Reid Simmons *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 275-281 (For primary document see N94-30526 08-63)

(Contract NAGW-1175; F08635-92-C-0019)

(AIAA Paper 94-1210-CP) Avail: CASI HC A02/MF A04

Task-level control refers to the integration and coordination of planning, perception, and real-time control to achieve given high-level goals. Autonomous mobile robots need task-level control to effectively achieve complex tasks in uncertain, dynamic environments. This paper describes the Task Control Architecture (TCA), an implemented system that provides commonly needed constructs for task-level control. Facilities provided by TCA include distributed communication, task decomposition and sequencing, resource management, monitoring and exception handling. TCA supports a

design methodology in which robot systems are developed incrementally, starting first with deliberative plans that work in nominal situations, and then layering them with reactive behaviors that monitor plan execution and handle exceptions. To further support this approach, design and analysis tools are under development to provide ways of graphically viewing the system and validating its behavior. Author

A PERFORMANCE ANALYSIS METHOD FOR DISTRIBUTED REAL-TIME ROBOTIC SYSTEMS: A CASE STUDY OF REMOTE TELEOPERATION

D. R. Lefebvre and A. C. Sanderson *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 287-297 (For primary document see N94-30526 08-63)

(Grants NGT-10000; NAGw-1333)

(AIAA Paper 94-1212-CP) Avail: CASI HC A03/MF A04

Robot coordination and control systems for remote teleoperation applications are by necessity implemented on distributed computers. Modeling and performance analysis of these distributed robotic systems is difficult, but important for economic system design. Performance analysis methods originally developed for conventional distributed computer systems are often unsatisfactory for evaluating real-time systems. The paper introduces a formal model of distributed robotic control systems; and a performance analysis method, based on scheduling theory, which can handle concurrent hard-real-time response specifications. Use of the method is illustrated by a case of remote teleoperation which assesses the effect of communication delays and the allocation of robot control functions on control system hardware requirements. (AIAA Paper 94-1213-CP) Avail: CASI HC A02/MF A04

In all embedded computing systems, some delay exists between sensing and acting. By choosing an action based on sensed data, a system is essentially predicting that there will be no significant changes in the world during this delay. However, the dynamic and uncertain nature of the real world can make these predictions incorrect, and thus, a system may execute inappropriate actions. Making systems more reactive by decreasing the gap between sensing and action leaves less time for predictions to err, but still provides no principled assurance that they will be correct. Using the concept of predictive sufficiency described in this paper, a system can prove that its predictions are valid, and that it will never execute inappropriate actions. In the context of our CIRCA system, we also show how predictive sufficiency allows a system to guarantee worst-case response times to changes in its environment. Using predictive sufficiency, CIRCA is able to build real-time reactive control plans which provide a sound basis for performance guarantees that are unavailable with other reactive systems. Author

USING GENERIC TOOL KITS TO BUILD INTELLIGENT SYSTEMS

David J. Miller *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 306-314 (For primary document see N94-30526 08-63)

(Contract DE-AC04-94AL-85000)

(AIAA Paper 94-1214-CP) Avail: CASI HC A02/MF A04

The Intelligent Systems and Robots Center at Sandia National Laboratories is developing technologies for the automation of processes associated with environmental remediation and information-driven manufacturing. These technologies, which focus on automated planning and programming and sensor-based and model-based control, are used to build intelligent systems which are able to generate plans of action, program the necessary devices, and use sensors to react to changes in the environment. By automating tasks through the use of programmable devices tied to computer models which are augmented by sensing, requirements for faster, safer, and cheaper systems are being satisfied. However, because of the need for rapid cost-effect prototyping and multi-laboratory teaming, it is also necessary to define a consistent approach to the construction of controllers for such systems. As a result, the Generic Intelligent System Controller (GISC) concept has been developed. This concept promotes the philosophy of producing generic tool kits which can be used and reused to build intelligent control systems. Author

(AIAA Paper 94-1218-CP) Avail: CASI HC A02/MF A04

We describe a core system for autonomous navigation in outdoor natural terrain. The system consists of three parts: a perception module which processes range images to identify untraversable regions of the terrain, a local map management module which maintains a representation of the environment in the vicinity of the vehicle, and a planning module which issues commands to the vehicle controller. Our approach is to use the concept of 'early traversability evaluation', and on the use of reactive planning for generating commands to drive the vehicle. We argue that our approach leads to a robust and efficient navigation system. We illustrate our approach by an experiment in which a vehicle travelled autonomously for one kilometer through unmapped cross-country terrain. Author

THE ROAD PLAN MODEL: INFORMATION MODEL FOR PLANNING ROAD BUILDING ACTIVITIES

Rafaela K. Azinhal and Fernando Moura-Pires *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 322-332 (For primary document see N94-30526 08-63)

(AIAA Paper 94-1219-CP) Avail: CASI HC A03/MF A04

The general building contractor is presented with an information model as an approach for deriving a high-level work plan of construction activities applied to road building. Road construction activities are represented in a Road Plan Model (RPM), which is modeled in the ISO standard STEP/EXPRESS and adopts various concepts from the GARM notation. The integration with the preceding road design stage and the succeeding phase of resource scheduling is discussed within the framework of a Road Construction Model. Construction knowledge is applied to the road design and the terrain model of the surrounding road infrastructure for the instantiation of the RPM. Issues regarding the implementation of a road planner application supporting the RPM are discussed. Author

DESIGN REUSE EXPERIENCE OF SPACE AND HAZARDOUS OPERATIONS ROBOTS

P. Graham ONeil *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994),

Volume 1 Mar. 1994 p 333-338 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1220-CP) Avail: CASI HC A02/MF A04

A comparison of design drivers for space and hazardous nuclear waste operating robots details similarities and differences in operations, performance and environmental parameters for these critical environments. The similarities are exploited to provide low risk system components based on reuse principles and design knowledge. Risk reduction techniques are used for bridging areas of significant differences. As an example, risk reduction of a new sensor design for nuclear environment operations is employed to provide upgradeable replacement units in a reusable architecture for significantly higher levels of radiation. A MULTI-MODE MANIPULATOR DISPLAY SYSTEM FOR CONTROLLING REMOTE ROBOTIC SYSTEMS
Michael J. Massimino, Michael F. Meschler, and Alberto A. Rodriguez *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 339-347 (For primary document see N94-30526 08-63)
(AIAA Paper 94-0888-CP) Avail: CASI HC A02/MF A04

The objective and contribution of the research presented in this paper is to provide a Multi-Mode Manipulator Display System (MMDS) to assist a human operator with the control of remote manipulator systems. Such systems include space based manipulators such as the space shuttle remote manipulator system (SRMS) and future ground controlled teleoperated and telescience space systems. The MMDS contains a number of display modes and submodes which display position control cues position data in graphical formats, based primarily on manipulator position and joint angle data. Therefore the MMDS is not dependent on visual information for input and can assist the operator especially when visual feedback is inadequate. This paper provides descriptions of the new modes and experiment results to date. Author

PROGRAMMABLE AUTOMATED WELDING SYSTEM (PAWS)
Martin D. Kline *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 348-353 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1221-CP) Avail: CASI HC A02/MF A04

An ambitious project to develop an advanced, automated welding system is being funded as part of the Navy Joining Center with Babcock & Wilcox as the prime integrator. This program, the Programmable Automated Welding System (PAWS), involves the integration of both planning and real-time control activities. Planning functions include the development of a graphical decision support system within a standard, portable environment. Real-time control functions include the development of a modular, intelligent, real-time control system and the integration of a number of welding process sensors. This paper presents each of these components of the PAWS and discusses how they can be utilized to automate the welding operation. Author

ROBOTIC NDE INSPECTION OF ADVANCED SOLID ROCKET MOTOR CASINGS
Glenn E. McNeelege and Chris Sarantos *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 354-366 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1222-CP) Avail: CASI HC A03/MF A04

The Advanced Solid Rocket Motor program determined the need to inspect ASRM forgings and segments for potentially catastrophic defects. To minimize costs, an automated eddy current inspection system was designed and manufactured for inspection of ASRM forgings in the initial phases of production. This system utilizes custom manipulators and motion control algorithms and integrated six channel eddy current data acquisition and analysis hardware and software. Total system integration is through a personal computer based workcell controller. Segment inspection demands the use of a gantry robot for the EMAT/ET inspection system. The EMAT/ET system utilized similar mechanical compliancy and software logic to accommodate complex part geometries. EMAT provides volumetric inspection capability while eddy current is limited to surface and near surface inspection. Each aspect of the systems are applicable to other industries, such as, inspection of pressure vessels, weld inspection, and traditional ultrasonic inspection applications. Author

AUTOMATION FOR NONDESTRUCTIVE INSPECTION OF AIRCRAFT
M. W. Siegel *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 367-377 (For primary document see N94-30526 08-63)
(Contract MDA972-92-J-1010)
(AIAA Paper 94-1223-CP) Avail: CASI HC A03/MF A04

We discuss the motivation and an architectural framework for using small mobile robots as automated aids to operators of nondestructive inspection (NDI) equipment. We review the need for aircraft skin inspection, and identify the constraints in commercial airlines operations that make small mobile robots the most attractive alternative for automated aids for NDI procedures. We describe the design and performance of the robot (ANDI) that we designed, built, and are testing for deployment of eddy current probes in prescribed commercial aircraft inspections. We discuss recent work aimed at also providing robotic aids for visual inspection. Author

AUTOMATED INSPECTION OF TURBINE BLADES: CHALLENGES AND OPPORTUNITIES
Manish Mehta, Joseph C. Marron, Robert E. Sampson, and George M. Peace *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 393-398 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1226-CP) Avail: CASI HC A02/MF A04

Current inspection methods for complex shapes and contours exemplified by aircraft engine turbine blades are expensive, time-consuming and labor intensive. The logistics support of new manufacturing paradigms such as integrated product-process development (IPPD) for current and future engine technology development necessitates high speed, automated inspection of forged and cast jet engine blades, combined with a capability of retaining and retrieving metrology data for process improvements upstream (designer-level) and downstream (end-user facilities) at commercial and

military installations. The paper presents the opportunities emerging from a feasibility study conducted using 3-D holographic laser radar in blade inspection. Requisite developments in computing technologies for systems integration of blade inspection in production are also discussed. Author

TRC RESEARCH PRODUCTS: COMPONENTS FOR SERVICE ROBOTS
W. Stuart Lob *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 399-404 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1227-CP) Avail: CASI HC A02/MF A04

Transitions Research Corporation has developed a variety of technologies to accomplish its central mission: the creation of commercially viable robots for the service industry. Collectively, these technologies comprise the TRC 'robot tool kit.' The company started by developing a robot base that serves as a foundation for mobile robot research and development, both within TRC and at customer sites around the world. A diverse collection of sensing techniques evolved more recently, many of which have been made available to the international mobile robot research community as commercial products. These 'tool-kit' research products are described in this paper. The largest component of TRC's commercial operation is a product called HelpMate for material transport and delivery in health care institutions. Author

AN UPDATE ON LAB ROVER: A HOSPITAL MATERIAL TRANSPORTER
Paul Mattaboni *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 405-406 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1228-CP) Avail: CASI HC A01/MF A04

The development of a hospital material transporter, 'Lab Rover', is described. Conventional material transport now utilizes people power, push carts, pneumatic tubes and tracked vehicles. Hospitals are faced with enormous pressure to reduce operating costs. Cyberotics, Inc. developed an Autonomous Intelligent Vehicle (AIV). This battery operated service robot was designed specifically for health care institutions. Applications for the AIV include distribution of clinical lab samples, pharmacy drugs, administrative records, x-ray distribution, meal tray delivery, and certain emergency room applications. The first AIV was installed at Lahey Clinic in Burlington, Mass. Lab Rover was beta tested for one year and has been 'on line' for an additional 2 years. Author (revised)

A ROBOTIC WHEELCHAIR
David P. Miller and Edward Grant *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 407-411 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1229-CP) Avail: CASI HC A01/MF A04

Many people who are mobility impaired are incapable, for a variety of reasons, of using an ordinary wheelchair. These people must rely on either a power wheelchair, which they control, or another person to push and guide them while they are in an ordinary or power wheelchair. Power wheelchairs can be difficult to operate. If a person has additional disabilities, either in perception or fine motor control of their hands, a power chair can be difficult or impossible for them to use safely. Having one person push and guide a person who is mobility impaired is very expensive, and if the disabled person is otherwise independent, very inefficient and frustrating. This paper describes a low-cost robotic addition to a power wheelchair that assists the rider of the chair in avoiding obstacles, going to pre-designated places, and maneuvering through doorways and other narrow or crowded areas. This system can be interfaced to a variety of input devices, and can give the operator as much or as little moment by moment control of the chair as they wish. Author

DEXTERITY ENHANCEMENT IN MICROSURGERY USING TELEMICRO-ROBOTICS Abstract Only
Steve Charles *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 412 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1230-CP) Avail: CASI HC A01/MF A04

The presentation will focus on finding the spectrum of dexterity performance while performing microsurgery in various specialties. It will be noted that individuals vary markedly in their performance in the position, velocity, stability, and force domains. There are surgeons who have a tremor who otherwise move very slowly and carefully while there are other surgeons who apply excessive force, but never have a tremor or move excessively fast. There are yet other surgeons who move excessively fast, yet they do not have a tremor. Dexterity enhancement includes position down scaling, tremor filtering, fatigue elimination, and other second-order issues such as confining the work space, velocities, accelerations, or forces. It will be described that the hand's position performance is degraded when it is asked to actuate the tools and that remote actuation alone increases the positioning capabilities. It will be noted that rotary and telescopic functions are far more difficult than writing or engraving-like motions. The safety issues concerning velocities and forces will be discussed and the need for impedance control pointed out. Simplistically, the devices should be made with variable compliance so that they can function rigidly as a robot would or compliantly as a human would, depending on the setting of this parameter. Tool interfaces will be discussed with an emphasis on the overall performance of the position, end effector, and tool as a unit. Space constraints, force, and velocity requirements will be discussed in this section as well. Referencing the coordinate system to pre- or inter-operative imaging systems will be discussed as well as an emphasis on the system architecture. Author

AN INTELLIGENT ROBOT FOR HELPING ASTRONAUTS
J. D. Erickson, K. A. Grimm, and T. W. Pendleton *In its* Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 421-433 (For primary document see N94-30526 08-63)
(AIAA Paper 94-1233-CP) Avail: CASI HC A03/MF A04

This paper describes the development status of a prototype supervised intelligent robot for space application for purposes of (1) helping the crew of a spacecraft such as the Space Station with various tasks, such as holding objects and retrieving/replacing tools and other objects from/into storage, and (2) for purposes of retrieving detached objects, such as equipment or crew, that have become separated from their spacecraft. In addition to this set of tasks in this low-Earth-orbiting spacecraft environment, it is argued that certain aspects of the technology can be viewed as generic in approach, thereby offering insight into intelligent robots for other tasks and environments. Candidate software architectures and their key technical issues which enable real work in real environments to be accomplished safely and robustly are addressed. Results of computer simulations of grasping floating objects are presented. Also described are characterization results on the usable reduced gravity environment in an aircraft flying parabola (to simulate weightlessness) and results on hardware performance there. These results show it is feasible to use that environment for evaluative testing of dexterous grasping based on real-time vision of freely rotating and translating objects. Author

ON-ORBIT SPACECRAFT SERVICING: AN ELEMENT IN THE EVOLUTION OF SPACE ROBOTICS APPLICATIONS

Carl J. Anders and Claude H. Roy *In* NASA. Johnson Space Center, Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), Volume 1 Mar. 1994 p 441-450 (For primary document see N94-30526 08-63)

(AIAA Paper 94-1236-CP) Avail: CASI HC A02/MF A04

This paper addresses the renewed interest in on-orbit spacecraft servicing (OSS), and how it fits into the evolution of space applications for intelligent robots. Investment in the development of space robotics and associated technologies is growing as nations recognize that it is a critical component of the exploration and commercial development of space. At the same time, changes in world conditions have generated a renewal of the interest in OSS. This is reflected in the level of activity in the U.S., Japan and Europe in the form of studies and technology demonstration programs. OSS is becoming widely accepted as an opportunity in the evolution of space robotics applications. Importantly, it is a feasible proposition with current technologies and the direction of ongoing research and development activities. Interest in OSS dates back more than two decades, and several programs have been initiated, but no operational system has come on line, arguably with the Shuttle as the exception. With new opportunities arising, however, a fresh look at the feasibility of OSS is warranted. This involves the resolution of complex market, technical and political issues, through market studies, economic analyses, mission requirement definitions, trade studies, concept designs and technology demonstrations. System architectures for OSS are strongly dependent on target spacecraft design and launch delivery systems. Performance and cost factors are currently forcing significant changes in these areas. This presents both challenges and opportunities in the provision of OSS services. In conclusion, there is no question OSS will become a reality, but only when the technical feasibility is combined with either economic viability or political will. In the evolution of space robotics satellite servicing can become the next step towards its eventual role in support of planetary exploration and human beings' journey out into the universe. Author

MULTI-SENSOR DATA FUSION AND THE USE OF ARTIFICIAL INTELLIGENCE

Rene G. Zuidgeest 22 Apr. 1992 18 p Presented at the 12th Conference on Artificial Intelligence, Avignon, France, 1-6 Jun. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract MOD-01689029811)

(PB94-126216; NLR-TP-92174-U; ETN-94-95579) Avail: CASI HC A03

The potential use of artificial intelligence in Multi-Sensor Data Fusion (MSDF) is shown. A general functional architecture of an MSDF system based on a command and control model, applied to battlefield surveillance, is given. Battlefield surveillance is considered as the continuous observation of the battlefield area to provide timely information for command and control functions. In TA-10, a project from which the results were generalized and are presented, battlefield surveillance was chosen as primary domain. The presented results are valid for application to other domains. A global description of the world model that includes MSDF and knowledge about the observed world is given. A specific set of artificial intelligence (AI) techniques for representation of that knowledge and reasoning with it is discussed. These techniques emerge from knowledge based systems (KBS); neural networks are not considered. KBS techniques were preferred because of their relative maturity, their ability to explain their reasoning process in a comprehensive manner (might be important in order to convince the operator), and the ease with which explicitly represented knowledge can be modified. A global distributed architecture for MSDF is described in which different KBS are identified. Conclusions are drawn. ESA

ASPECTS OF VISION AND PLANNING IN A DYNAMIC, UNCERTAIN ENVIRONMENT Ph.D. Thesis

Rajeev Sharma 1993 183 p

Avail: Univ. Microfilms Order No. DA9327493

Autonomous visual navigation involves the challenge of developing vision and planning algorithms for dealing with an uncertain and changing environment. Traditional approaches to visual navigation assume that a 3-D description of the scene is necessary for planning and that it is possible to extract such a description from a sequence of images. This typically leads to the development of vision and planning modules that do not work well together. An alternative is to use abstractions that adequately describe the interaction between the robot and its dynamic environment without relying on a 3-D description of the dynamic scene. This helps in posing simpler vision problems and in reducing the computational burden on the dynamic motion planning algorithms. An important step in sensing a dynamic environment is the detection of moving objects in the scene. We present an active vision technique for motion detection which is based on exploration strategies that can be dynamically adjusted to suit the current goal or purpose of the overall system. A theoretical analysis establishes conditions that are necessary and sufficient to guarantee motion detection at a point. The technique uses the spatio-temporal gradients of the image sequence, hence is implementable in real time and is robust compared to approaches that require the computation of optical flow. For

motion planning in a dynamic, uncertain environment, one of the main problems is that of modeling the situation so that a meaningful criterion can be applied to evaluate alternate plans. We propose a probabilistic model based on 'discrete events' that would effect the robot's behavior in response to the unknown component of the dynamic environment. The resulting framework makes it possible to design and evaluate motion planning strategies that consider both the known portion of the environment and the portion that is unknown but satisfies a probability distribution. We give a few instances of the general model which can be used for developing motion planning algorithms as a function of parameters representing a robot's environment and its behavior with respect to unexpected events detected by visual and other sensors. Detailed solutions are developed for a local path optimization problem and for motion planning in a hazardous environment. Dissert. Abstr.

ROBUST ADAPTIVE CONTROL OF A MECHANICAL MANIPULATOR Ph.D. Thesis
Zanyu Yan 1992 248 p
Avail: Univ. Microfilms Order No. DA9319114

This dissertation concerns an active topic: robust adaptive control of a mechanical manipulator. The contributions of the dissertation are mainly in two areas: a robust control design method has been analyzed and a practical robust adaptive control scheme has been proposed to deal with real systems in the presence of not only structured but also unstructured uncertainties. In addition, an application of the proposed robust adaptive control scheme for a mechanical manipulator has been developed and numerically demonstrated. Based on small gain theorem and averaging method, the analysis explains that instabilities in adaptive control schemes are mainly due to high frequency infinite gain and inaccurate parameter estimation. Also, based on the control design principal of high gain in the low frequency range and low gain in the high frequency range, we clearly divide the entire frequency range into three frequency ranges: a low frequency range, a high frequency range, and an interconnect frequency range. Thus, we propose second-order desired dynamics with damping factor zeta = 1, a prefilter design, and a suitable sampling period. This will ensure dominant low frequency characteristics and robustness of the control system. The combination of robust control and accurate parameter estimation ensures robustness of the entire adaptive control system. The simulation for a two-link mechanical manipulator shows that this proposed method results in a robot system which is very robust to structured and unstructured uncertainties. The simulation for a more realistic six degree of freedom PUMA 560 demonstrates that the proposed approach may result in better performance when compared with other methods. Dissert. Abstr.

ELF: LEARNING INCOMPLETE FUZZY RULE SETS FOR AN AUTONOMOUS ROBOT
Andrea Bonarini Jun. 1993 9 p
(Rept-93-043; ETN-94-95812) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Experience in learning fuzzy rules using Evolutionary Algorithms (EA's) is presented. The application is a mobile robot, FAMOUSE (Fuzzy AutonoMOUSE), which has to do reactive tasks in an unknown environment. The characteristic feature of the learning algorithm, ELF (Evolutionary Learning of Fuzzy rules), is that, in contrast to most of the other approaches based on genetic algorithms, it is to learn a set of rules smaller than that needed to cover completely the combinations of all the values of all the antecedents (complete rulebase). ELF can also generate and maintain in the rule population rules for situations where the evaluation function does not evaluate uniformly all the rules. ESA

SOME METHODOLOGICAL ISSUES ABOUT DESIGNING AUTONOMOUS AGENTS WHICH LEARN THEIR BEHAVIORS: THE ELF EXPERIENCE
Andrea Bonarini Oct. 1993 10 p Sponsored in part by Ministry of University and Scientific and Technological Research
(Rept-93-068; ETN-94-95826) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Experience in developing behavior based autonomous agents is presented. Focus is on methodological aspects of 'behavior engineering', a branch of engineering whose aim is to design and implement behavior based agents. Once a behavior is defined, it must be decided whether to implement it by programming the agent, or to make the agent learn its behavior. Results obtained with a machine learning algorithm (ELF (Evolutionary Learning of Fuzzy Systems)) learning behaviors described as sets of fuzzy rules are reported. The characteristic features of ELF are that it can learn the only rules it needs to achieve its task, it is resistant to biased evaluation functions, and it can learn generalizations. ESA

ITERATIVE REMOVAL OF BOUNDARY MINIMA OF HARMONIC POTENTIAL FUNCTION FOR MOBILE ROBOT NAVIGATION
Giuseppe Borghi 1993 7 p
(Rept-93-059; ETN-94-95821) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

An algorithm for real time obstacle avoidance for mobile robots with a navigation task is presented. The method, based on harmonic potential function and real time world modeling, allows unexpected obstacles to be detected and avoided without any need to stop the robot. The algorithm, overcoming limitations of local minima, can face unknown cluttered environment composed of arbitrarily shaped obstacles. The use of harmonic potential functions eliminates local minima in the free space (only unstable minima are present). The algorithm, starting from a given path to be followed, makes local replanning of it, based on sonar sensor data. This approach allows unexpected obstacles to be avoided, integrating information provided by global path planner. A grid type world model is used, building on it a harmonic potential function. A method to compute in real time the potential function and to manage its boundary minima, is presented. The proposed algorithm can face arbitrarily shaped obstacles (for example concave obstacles), narrow passages (for example doorway) and slow moving obstacles (for example persons). The method was tested on a mobile robot having 24 sonar sensors in an indoor environment. ESA

ROBUST CONTROL OF ROBOTS VIA LINEAR ESTIMATED STATE-FEEDBACK
Harry Berghuis and Henk Nijmeijer Aug. 1993 14 p Sponsored by Netherlands Technology Foundation Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-2690)
(MEMO-1153; ETN-94-95727) Avail: CASI HC A03

A robust tracking controller for robots that requires only position measurements is proposed. The controller consists of two parts: a linear observer part that generates an estimated error state from the error on the position, and a linear feedback part that utilizes this estimated state. It is shown that this computationally efficient controller yields uniform ultimate boundedness of the tracking error. An interesting feature of the controller is that it straightforwardly extends recent results on robust control of robots by linear state feedback to linear estimated state feedback. ESA

This is the final report for the Courant Mathematics and Computing Laboratory (CMCL) research program for the years 1991-1993. Our research efforts encompass the formulation of physical problems in terms of mathematical models (both old and new), the mathematical analysis of such models, and their numerical resolution. This last step involves the development and implementation of efficient methods for large scale computation. Our analytic and numerical work often go hand in hand; new theoretical approaches often have numerical counterparts, while numerical experimentation often suggests avenues for analytical investigation. One of the intriguing open problems on competition graphs is determining what digraphs have interval competition graphs. In this paper we consider this problem for the class of loopless symmetric digraphs. Here we first consider forbidden subgraph characterizations of graphs with interval two-step graphs. We then characterize a large class of graphs with interval two-step graphs, using the Fulkerson-Gross characterization of interval graphs. DTIC

NUMERICAL ANALYSIS AND COMPUTATION OF NONLINEAR PARTIAL DIFFERENTIAL EQUATIONS FROM APPLIED MATHEMATICS Final Report, 1 Jan. 1991 - 30 Sep. 1993
Donald A. French 30 Nov. 1993 4 p
(Contract DAAL03-91-G-0010)
(AD-A275582; ARO-28535.7-MA) Avail: CASI HC A01/MF A01
This report gives a brief discussion of the different problem areas under which research papers have been published during the term of the grant as well as a short description of the main results. In this research finite element methods were applied to a simple model of shear band formation. They were also used for elliptic and parabolic problems that arise in optimal control and for equations that simulate phase transitions. These finite element schemes were analyzed and implemented. Also, studies of space-time schemes where the Galerkin technique is used to discretize time as well as space were the focus of several papers. Finally, a last paper contains a thorough analysis of an adaptive time discretization technique. DTIC

FREQUENCY-DOMAIN TRANSFER-FUNCTION IDENTIFICATION USING CHEBYSHEV POLYNOMIALS
J. M. Johnson and D. J. Trudnowski Dec. 1993 3 p Presented at the 32nd IEEE Conference on Decision and Control, San Antonio, TX, Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contracts DE-AC06-76RL-01830; DE-FG06-89ER-75522)
(DE94-004777; PNL-SA-22915; CONF-931233-3) Avail: CASI HC A01
An approach is proposed for identifying a linear single-input single-output model from the frequency response of a system with unknown order. The approach involves representing the transfer function as the ratio of linearly-combined Chebyshev polynomials and solving an over-determined linear equation set. The method is compared with two other previously proposed techniques and shown to perform very well under noisy data conditions. DOE

(Contract DAAL03-90-G-0216)
(AD-A275560; ARO-28186.9-MA) Avail: CASI HC A05/MF A01
The primary objectives of this research are the development of algorithms which are applicable to non-linear continuum mechanic problems, especially to Stefan's Problems and Fluid Flows in Porous Media (Richard's Equation). We have studied 2-D and 3-D related problems. The codes are written in Cray Fortran and vectorization are done on the Cray Y-MP. The results obtained by Compact ADI, Finite Difference SOR and ADI are compared. It is seen that Compact ADI is superior. Six scientific research Papers have been presented/published in various conferences and journals in the last two years. All of the papers are attached in the appendix as attachments. Two senior faculty members worked in this project. Bolindra N. Borah

(P.I.), Professor, North Carolina A&T State University, Robert E. White (Co-P.I.), Professor, North Carolina State University are the principal researchers. Besides, four graduate students participated in this project. Two have already completed the M.S. in Applied Mathematics while the other two are completing in the Spring Semester 1994. DTIC

LEAST-SQUARES DETERMINATION OF BURST-POINT COORDINATES Final Report, Jan. 1992 - Sep. 1993
Aivars Celmins and Miguel Andriolo Dec. 1993 30 p
(DA Proj. 1L1-62618-AH-80)
(AD-A275423; ARL-TR-321) Avail: CASI HC A03/MF A01

This report describes the determination of burst-point coordinates from azimuth and elevation measurements by the method of least squares. The observations are made from a number of observation towers and observed are angles of azimuth and elevation. Both angles are treated as regression variables, and the burst-point coordinates are determined by minimizing the sum of the correction squares of all observations. Two numerical solution methods are presented, both producing identical results. Methods for the detection of outliers in burst-point observations are briefly discussed. The presented coordinate determination is based on the concept of least-squares regression and differs from another algorithm that has been recently proposed in the Ballistic Research Laboratory Report BRL-MR-3894. STABILITY PROPERTIES OF INCLUSIVE CONNECTIVITY FOR GRAPHS Ph.D. Thesis
David W. Cribb Dec. 1993 141 p
(AD-A275360; AFIT/CI/CIA-93-29D) Avail: CASI HC A07/MF A02

This dissertation is an investigation of inclusive connectivity which is a localization of connectivity defined for each vertex and each edge of a graph. The inclusive edge (vertex, mixed) connectivity of a vertex v is the minimum number of edges (vertices, graph elements) whose removal yields a subgraph in which v is a cut vertex. All possible combinations of these three parameters with regard to edge addition stability, in which the value of the parameter will remain unchanged after the addition of any edge, are studied along with other various properties including a relationship between the stability of inclusive connectivity and global connectivity. A similar study in the stability for inclusive connectivity for edge deletion is conducted. Final topics include neutral edges, where a neutral edge is one whose removal does not change the respective inclusive connectivity value of any vertex, and inclusive connectivity stable graphs, where the sum of the respective inclusive connectivity values for all vertices remains the same no matter what edge is deleted. INCORPORATING GEOMETRIC CONSTRAINTS INTO RULE-BASED SYSTEMS USING NONLINEAR OPTIMIZATION Scientific Paper
Jo Ann Parikh and Anne Werkheiser Jan. 1994 8 p
(Grant NSF IRI-91-08638)
(AD-A275093; TEC-R-204) Avail: CASI HC A02/MF A01

A transformation procedure is presented for converting rule-based systems with nonlinear constraints into nonlinear optimization problems. The transformation procedure is then applied to an illustrative site identification system. Nonlinear optimization problems are constructed both for the subset of rules consisting only of logical predicates and for the complete system. Experimental results obtained by solving the nonlinear optimization problems for the site identification system yield a complete description of valid variable bindings for all rules in the system. This procedure was developed in response to the need to solve logical deployment problems for the U.S. Army. In this application domain, numerical, geometric, and geographic constraints must be incorporated with logical constraints in a uniform framework as in human inference. Rules in the system must be able to express various types of relationships, including relationships in the form of nonlinear constraints. Modeling rule-based systems as nonlinear optimization problems provides a powerful, uniform framework with the flexibility to handle mixed data types and numerical and geometric relationships. DTIC

SOLUTION OF AUGMENTED SYSTEMS
I. S. Duff 1 Nov. 1993 19 p
(PB94-138211; RAL-93-084) Avail: Issuing Activity (National Technical Information Service (NTIS))

We examine the solution of sets of linear equations for which the coefficient matrix has the form--first row: H A; second row (beneath first row): A(sup T) 0, where the matrix H is symmetric. We are interested in the case when the matrices H and A are sparse. These augmented systems occur in many application areas, for example in the solution of linear programming problems, structural analysis, magnetostatics, differential algebraic systems, constrained optimization, electrical networks, and computational fluid dynamics. We discuss in some detail how they arise in the last three of these applications and consider particular characteristics and methods of solution. We then concentrate on direct methods of solution. We examine issues related to conditioning and scaling, and discuss the design and performance of a code for solving these systems. NTIS

APPROXIMATION OF SOLUTIONS OF THE CUBIC NLSE BY FINITE DIMENSIONAL EQUATIONS AND NON-SQUEEZING PROPERTIES
J. Bourgain Nov. 1993 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-138294; IHES/M/93/61) Avail: CASI HC A03

We prove a non-squeezing result for the cubic non-linear Schrodinger equation (NLSE), extending to the NLSE some recent work of S. Kuksin. The main feature of this situation is that the flow map is not a compact perturbation of a linear map. The method consists in a direct reduction of the problem to a finite dimensional model where the symplectic capacity preservation holds. This is achieved by elaborating some of the techniques of other papers by the author. The precise form of the non-linearity is of importance in this argument. NTIS

SOME EFFICIENT PROCEDURES FOR CORRECTING TRIANGULATED MODELS
I. Maekelae and A. Dolenc Jul. 1993 17 p
(PB94-136926; TKO-B108) Avail: CASI HC A03/MF A01

This paper describes methods for handling efficiently a large class of problems encountered when dealing with 3D models represented by a collection of triangles in STL format. In spite of its drawbacks, the STL format has become a de facto industrial standard for transferring models to manufacturing processes generally known as Rapid Prototyping Techniques (RPT) or Solid Freeform Fabrication (SF2). As the accuracy and size of the workspace of such processes increases, so does the size of the models one wishes to manufacture. Therefore, the efficiency of application programs is an important consideration. Previous published work has focused on the problem of eliminating gaps in triangulated models. In addition to efficiency, this paper describes methods for dealing with other

problems such as overlapping triangles and intersecting triangles. The algorithms have been implemented and tested in industry. The underlying data structures based on adaptive space subdivision also allow the development of other efficient tools such as slicing. NTIS

PROGRAM DERIVATION BY PROOF TRANSFORMATION Ph.D. Thesis
Penny Anderson Oct. 1993 189 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A275260; CMU-CS-93-206) Avail: CASI HC A09/MF A02

In the proofs-as-programs methodology, verified programs are developed through theorem-proving a constructive logic. Under this approach, the theorem-proving process can be regarded as a program derivation process. The merits of this approach to programming are twofold. First, working with proofs instead of programs concentrates the developer's effort on the intellectually difficult part of the development process: understanding, solving, and explaining the solution to a mathematical problem. Second, the proof provides a formal and trustworthy basis for an explanation of the program. This thesis investigates the use of proof transformation as a way to address important concerns in program derivation that are not addressed by theorem-proving alone. One difficulty with the proofs-as-programs strategy arises from the conflict between elegance and efficiency. A simple, elegant proof may lead to an inefficient program. A more complex proof that corresponds to a more efficient program may be difficult to invent or understand. With proof transformations, a developer can start with an elegant proof that is easy to understand, and incrementally derive a more complex proof and thus, a more efficient program. Another problem comes from the need for adaptation and reuse. With current automated support for theorem-proving, it is difficult to re-use previous work other than by re-using lemmas from a library. This kind of reuse is analogous to the use of subroutine libraries in ordinary programming, and does not directly, support adaptation. Proof transformations provide a way of adapting a proof to a new context. DTIC

COMPOUND MATRIX METHOD FOR MULTI-POINT BOUNDARY-VALUE PROBLEMS
S. Ivansson Oct. 1993 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0347-3694)
(PB94-137791; FOA-C-20948-2.2) Avail: CASI HC A03

The compound matrix method is generalized to handle multi-point boundary-value problems for ordinary differential equation (ODE) systems. A general treatment is given, covering all orders of the linear ODE system and all distributions of the linear boundary conditions in a unified way. Certain quadratic relations for the minors are derived. An appropriate adjoint problem is defined for the multi-point case. In the applications, it frequently happens that a family of boundary-value problems has to be considered that depends analytically on some parameter. We show how a characteristic function and eigensolutions can be computed in this case. An explicit formula is derived for the excitation coefficients of the eigensolutions (the residue contributions). It is given in terms of the solution to the adjoint problem and hence, it does not involve compound entities. Applications to wave propagation computations for range-independent fluid-solid media are presented in a companion paper. NTIS

Higher order algebraic specification is a synthesis of first order algebraic specification and higher order functional programming which is both logically appealing as well as considerably more expressive than its two predecessors. To illustrate this, the static semantics of a simple block structured programming language using second order equations in addition to first order ones are described. The specification has a highly nondeterministic character and does not use a type environment. It supports error recovery and early detection of errors in incomplete programs. ESA

ITERATIVE PROCEDURE AS EQUATION OF MOTION
V. I. Yukalov and E. P. Yukalova 1992 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608008; JINR-E-5-92-428) Avail: CASI HC A03 (US Sales Only)

It is shown that any iterative procedure can be treated as an equation of motion corresponding to an autonomous dynamical system. Iterative cascades and flows are defined. The sequence of iterative terms composes a trajectory whose form is governed by a set of governing functions. The latter are given by fixed point conditions. The sought limit of the iterative procedure plays the role of an attractor. DOE

PERIODIC ORBITS OF n-BODY TYPE PROBLEMS: THE FIXED PERIOD CASE
H. Riahi Aug. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608096; IC-93/256) Avail: CASI HC A03 (US Sales Only)

This paper gives a proof of the existence and multiplicity of periodic solutions to Hamiltonian systems. The proof is based on the study of the critical points at infinity done by the author in a previous paper and generalizes the topological arguments used by A. Bahri and P. Rabinowitz in their study of the 3-body problem. It uses a recent result of E. Fadell and S. Husseini on the homology of free loop spaces on configuration spaces. The detailed proof is given for the 4-body problem then generalized to the n-body problem. DOE

M-INTERFERENCE QUEUE ANALYSIS BY DECOMPOSITION METHOD M.S. Thesis
Xiao-Xiong Yao 1992 136 p
(ISBN-0-315-85795-1; CTN-94-61166) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The M-interference queueing problem in shared channel communication networks is studied. An effective approach called the decomposition method

is proposed, which decomposes the interaction of M-interference stations into a set of simple queues. The performance of the symmetric shared channel communication networks can be evaluated through analysis of the queueing behavior of only one station using queueing theory. Three examples are used to illustrate this approach. Simulation programs were also developed and run to verify the analytical results. For the time division multiple access system, analytical results for both the packet delay performance and message delay performance were obtained. The analytical results were found to match the existing and simulation results exactly, indicating that the system is decomposable. For the token ring system, results show that the token ring network can be decomposed in an exhaustive service policy and can be approximated as a decomposable system in a single service policy. For a slotted ALOHA system with a finite number of stations, each with an infinite buffer, delay performance values obtained by the decomposition approach were in good agreement with the simulation results. The overall results indicate that the decomposition method is feasible for the analysis of the M-interference queueing problem. Author (CISTI)

A SPECTRAL BOUNDARY INTEGRAL EQUATION METHOD FOR THE 2-D HELMHOLTZ EQUATION Final Report

Fang Q. Hu (Old Dominion Univ., Norfolk, VA.) Mar. 1994 24 p Submitted for publication

(Contract NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-194890; NAS 1.26:194890; ICASE-94-15) Avail: CASI HC A03/MF A01

In this paper, we present a new numerical formulation of solving the boundary integral equations reformulated from the Helmholtz equation. The boundaries of the problems are assumed to be smooth closed contours. The solution on the boundary is treated as a periodic function, which is in turn approximated by a truncated Fourier series. A Fourier collocation method is followed in which the boundary integral equation is transformed into a system of algebraic equations. It is shown that in order to achieve spectral accuracy for the numerical formulation, the nonsmoothness of the integral kernels, associated with the Helmholtz equation, must be carefully removed. The emphasis of the paper is on investigating the essential elements of removing the nonsmoothness of the integral kernels in the spectral implementation. The present method is robust for a general boundary contour. Aspects of efficient implementation of the method using FFT are also discussed. A numerical example of wave scattering is given in which the exponential accuracy of the present numerical method is demonstrated. Author (revised)

CANONICAL-VARIABLES MULTIGRID METHOD FOR STEADY-STATE EULER EQUATIONS

Shlomo Taasan (Weizmann Inst. of Science, Rehovoth, Israel.) Mar. 1994 14 p Proposed for presentation at the 14th International Conference on Numerical Methods in Fluid Dynamics, Bangalore, India, Jul. 1994

(Contract NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-194888; NAS 1.26:194888; ICASE-94-14) Avail: CASI HC A03/MF A01

A novel approach for the solution of inviscid flow problems for subsonic compressible flows is described. The approach is based on canonical forms of the equations, in which subsystems governed by hyperbolic operators are separated from those governed by elliptic ones. The discretizations used as well as the iterative techniques for the different subsystems are inherently different. Hyperbolic parts, which describe, in general, propagation phenomena, are discretized using upwind schemes and are solved by marching techniques. Elliptic parts, which are directionally unbiased, are discretized using h-elliptic central discretizations, and are solved by pointwise relaxations together with coarse grid acceleration. The resulting discretization schemes introduce artificial viscosity only for the hyperbolic parts of the system; thus a smaller total artificial viscosity is used, while the multigrid solvers used are much more efficient. Solutions of the subsonic compressible Euler equations are achieved at the same efficiency as the full potential equation. Author (revised)

ACCURATE FINITE DIFFERENCE METHODS FOR TIME-HARMONIC WAVE PROPAGATION Final Report

Isaac Harari (Tel-Aviv Univ., Israel.) and Eli Turkel (Tel-Aviv Univ., Israel.) Mar. 1994 41 p Submitted for publication

(Contract NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-194887; NAS 1.26:194887; ICASE-94-13) Avail: CASI HC A03/MF A01

Finite difference methods for solving problems of time-harmonic acoustics are developed and analyzed. Multidimensional inhomogeneous problems with variable, possibly discontinuous, coefficients are considered, accounting for the effects of employing nonuniform grids. A weighted-average representation is less sensitive to transition in wave resolution (due to variable wave numbers or nonuniform grids) than the standard pointwise representation. Further enhancement in method performance is obtained by basing the stencils on generalizations of Pade approximation, or generalized definitions of the derivative, reducing spurious dispersion, anisotropy and reflection, and by improving the representation of source terms. The resulting schemes have fourth-order accurate local truncation error on uniform grids and third order in the nonuniform case. Guidelines for discretization pertaining to grid orientation and resolution are presented. Author (revised)

FORMULAS OF THE RUNGE-KUTTA-NYSTROEM TYPE M.S. Thesis [FORMULES DE TYPE RUNGE-KUTTA-NYSTROEM]

Fadi Malek 1992 56 p In FRENCH

(ISBN-0-315-85774-9; CTN-94-61165) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Explicit Runge Kutta Nystroem pairs, which solve directly second order initial value problems of the form $y'' = f(x,y)$ with the first derivative y' absent, are considered. Pairs consisting of formulae of order p-1 and p, respectively, can be designed to control the local error in y, in y', or in y and y'. They may also advance the numerical approximations using the lower order formulae or the higher order formulae. These two sets of choices lead to five types of pairs. The minimum number of stages required to form the five types of pairs are established for $p=2$ to 6 by producing an existing pair and disproving the existence of a similar pair with fewer stages. Notions of Nystroem methods and Nystroem trees are recalled along with the order conditions for these methods. Author (CISTI)

LARGE-SCALE 3-D SOLUTIONS OF THE TIME-DEPENDENT DIRAC EQUATION

A. S. Umar (Vanderbilt Univ., Nashville, TN.), J. C. Wells (Vanderbilt Univ., Nashville, TN.), V. E. Oberacker (Vanderbilt Univ., Nashville, TN.), and M. R. Strayer 1993 9 p Presented at the 2nd International Conference on Computational Physics, Beijing, China, 13-17 Sep. 1993

(Contract DE-AC05-84OR-21400)

(DE94-005591; CONF-9309176-4) Avail: CASI HC A02/MF A01

The authors present the numerical approach used in solving the time-dependent Dirac equation on a three-dimensional Cartesian lattice. Discretization is achieved through the lattice basis-spline collocation method, in which quantum-state vectors and coordinate-space operators are expressed in terms of basis-spline functions on a spatial lattice. All numerical procedures reduce to a series of matrix-vector operations which are performed on the Intel iPSC/860 hypercube, making full use of parallelism. The authors discuss their solutions to the problems of limited node memory and node-to-node communication overhead inherent in using distributed-memory. DOE

DYNAMIC GENERALIZED QUANTIFIERS AND MONOTONICITY

Makoto Kanazawa (Stanford Univ., CA.) Mar. 1993 31 p

(Contract NF-102/62-356) (ISSN 0928-3307)

(LP-93-02; ETN-94-95560) Avail: CASI HC A03/MF A01

The system of DPL (Dynamic Predicate Logic) augmented with Generalized Quantifiers (GQ's) is addressed. This can be seen as a refinement of first order logic with GQ's, just as DPL is a refinement of

first order logic. The GQ of interest is what Groenendijk and Stokhof would call 'internally dynamic' GQ's. They allow an indirect binding relation to obtain between dynamic existential quantifiers in their first argument and corresponding variables in their second argument. An empirical motivation for studying such GQ's comes from donkey sentences with relative clauses. ESA

A SMART CHILD OF PEANO'S
V. Y. Shavrukov 8 Dec. 1992 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3315)
(ML-92-10; ETN-94-95545) Avail: Issuing Activity (European Space Agency (ESA))

The provability logic of a special form of the Feferman provability predicate together with the usual provability predicate of Peano Arithmetic (PA) is calculated. In other words, a bimodal system is constructed with the intended interpretation of the expression square phi being as usual the formalization of 'phi is provable in PA' and the new modal operator triangle standing, when applied to phi, for 'there exists an x s.t. l(summation(sub x)) is consistent and proves phi.' The new system is called LF. A Kripke semantics for LF is constructed, and the arithmetical completeness theorem for this system is proved. A small number of other issues concerning the Feferman predicate, such as uniqueness of goedelsentences for the triangle, are considered. ESA

IDENTITY: QUARRELLING WITH AN UNPROBLEMATIC NOTION
Jacques vanLeeuwen Mar. 1993 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3307)
(LP-93-04; ETN-94-95562) Avail: CASI HC A03

A progressive series of questions about identity is answered. The questions, and where possible answers, are: are there genuine questions of identity (yes); why can there be problems of identity if identity is such a simple and unproblematic relation; how can it be guaranteed that in each specific identity statement the relevant criterion of identity is co-satisfiable with the general structural properties of identity (especially the principle of indiscernibility); does the fact that there are incompatible criteria of identity imply that the basic properties of identity must be denied for the corresponding identity relations (no). The treatment of identity in possible world semantics is also addressed. The interplay between identity, reference, quantification and intensional operators has been frequently discussed in the literature on possible world semantics. It is hoped to shed light on these discussions with the help of the philosophical insights exposed. Concentration is thereby on the opposite approaches of Kripke and Hintikka in their treatment of cross-world identity. A critical study of the philosophical motivations of these writers is given. It is considered that the use of alternative 'world lines' in Hintikka's approach is important for the purpose of knowledge representation. It is proposed to use world lines in order to represent the identifications of a subject of knowledge, including cases of misidentification. In this way a drawback of Kripke's approach is overcome. ONLY FEW GRAPHS HAVE BOUNDED TREEWIDTH
T. Kloks and H. Bolaender Nov. 1992 15 p Sponsored by Netherlands Foundation for Computer Science Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-92-35; ETN-94-95625) Avail: CASI HC A03

The treewidth of random graphs is studied. Let delta be greater than 1 and epsilon less than (delta - 1)/(delta + 1). Then almost all graphs with n vertices and with at least delta(n) edges have treewidth greater than or equal to n to the power epsilon. It is also shown that almost all graphs with n vertices and delta(n) edges have treewidth greater than b(sub delta)(n), where b(sub delta) is strictly positive if delta is greater than 1.18. It is shown that for every b greater than 0 and less than 1, there exists a delta(sub b), such that almost all graphs with at least delta(sub b)(n) edges have treewidth greater than bn. The methods, together with recent results on minor theory, also show the following. Let delta be greater than or equal to 1.18. There exists a positive constant c(sub delta), such that a.e. graph G(sub n, m) with m greater than or equal to delta(n) has a clique minor K(sub s) with s greater than or equal to (C(sub delta)n to the 1/3 power). This extends earlier results of Bollobas et al. The following is shown. Let G be a minor closed class of graphs (for example the class of planar graphs). For all delta greater than or equal to 1.18, if m is greater than or equal to delta(n) then a.e. graph with m edges is not in G. ESA

DERIVATION LENGTHS IN TERM REWRITING FROM INTERPRETATIONS IN THE NATURALS
V. C. S. Meeussen and H. Zantema Dec. 1992 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-92-43; ETN-94-95633) Avail: CASI HC A03

Monotone interpretations in the natural numbers provide a useful technique for proving termination of Term Rewriting Systems (TRS). Termination proofs of this shape imply upper bounds on derivation lengths expressed in bounds on the interpretations. For a hierarchy of classes of interpretations, a description of these upper bounds, among which the doubly exponential upper bound for polynomial interpretations, found by Hofbauer and Lautemann, is given. By examples of term rewriting systems it is shown that all of these upper bounds are sharp in a natural sense. In particular, all Ackermann functions are found as sharp upper bounds on derivation lengths exhausting primitive recursive functions. ESA

FOUR-DIMENSIONAL DATA ASSIMILATION USING THE ADJOINT METHOD Ph.D. Thesis
Jian-Wen Bao 1993 167 p
Avail: Univ. Microfilms Order No. DA9326808

The calculus of variations is used to confirm that variational four-dimensional data assimilation (FDDA) using the adjoint method can be implemented when the numerical model equations have a finite number of first-order discontinuous points. These points represent the on/off switches associated with physical processes, for which the Jacobian matrix of the model equation does not exist. Numerical evidence suggests that, in some situations when the adjoint method is used for FDDA, the temperature field retrieved using horizontal wind data is numerically not unique. A physical interpretation of this type of non-uniqueness of the retrieval is proposed in terms of energetics. The adjoint equations of a numerical model can also be used for model-parameter estimation. A general computational procedure is developed to determine the size and distribution of any internal model parameter. The procedure is then applied to a one-dimensional shallow fluid model in the context of analysis-nudging FDDA; the weighting coefficients used by the Newtonian nudging technique are determined. The sensitivity of these nudging coefficients to the optimal objectives and constraints is investigated. Experiments of FDDA using the adjoint method are conducted using the dry version of the hydrostatic Penn State/NCAR mesoscale model (MM4) and its adjoint. The minimization procedure

converges and the initialization experiment is successful. Temperature-retrieval experiments involving an assimilation of the horizontal wind are also carried out using the adjoint of MM4. Dissert. Abstr.

A NOTE ON THE COMPLEXITY OF LOCAL SEARCH PROBLEMS

Sophie Fischer Mar. 1993 15 p Sponsored by Netherlands Organization for Scientific Research

(ISSN 0928-3323)

(CT-93-02; ETN-94-95556) Avail: CASI HC A03/MF A01

The complexity of finding a local optimum in combinatorial optimization problems is studied. For many optimization problems derived from NP complete decision problems, for example MAXCLIQUE, a locally optimal solution starting from a given solution can be found in (deterministic) polynomial time. It is not known, however, whether this is a property shared by all these problems. In particular, the class of PLS complete problems seems to form an exception. Several problems for which the question, whether for a given solution a local optimum 'exists' within a polynomial of PLS steps, is NP complete, are presented. ESA

INTERROGATIVES AND ADVERBS OF QUANTIFICATION

Jeroen Groenendijk and Martin Stokhof Dec. 1992 31 p Submitted for publication

(ISSN 0928-3307)

(LP-92-14; ETN-94-95558) Avail: CASI HC A03/MF A01

A topic in the semantics of interrogatives is studied. It is a modified and extended version of a note on interrogatives and quantification, taking into consideration remarks by U. Lahiri. An aim is to show that, appearances notwithstanding, quantificational variability can be accounted for in an approach which complies with strong exhaustiveness. The implementation of the semantic analysis of interrogatives is outlined, and the challenge that Berman's proposals form for this analysis is discussed. The meeting of this challenge, making use of insights from dynamic semantics, is shown. Addressing of some of Lahiri's examples is outlined. ESA

THE EXACT FITTING PROBLEM IN HIGHER DIMENSIONS

Jean-Marc Robert (Quebec Univ., Chicoutimi.), Leonidas J. Guibas (Stanford Univ., CA.), and Mark H. Overmars Nov. 1992 20 p Sponsored in part by Netherlands Organization for Scientific Research, and EEC

(ISSN 0924-3275)

(RUU-CS-92-37; ETN-94-95627) Avail: CASI HC A03/MF A01

Let S be a family of n points in E(sup d). The 'exact fitting' problem asks for finding a hyperplane containing the maximum number of points of S. An O(min((n(sup d))/(m(sup d - 1))log n/m, n(sub d)) time algorithm where m denoted the number of points on the hyperplane is presented. This algorithm is based on upper bounds on the maximum number of incidences between families of points and families of hyperplanes in E(sup d) and on an algorithm to compute these incidences. It is also shown how the upper bound on the maximum number of incidences between families of points and families of hyperplanes can be used to derive new bounds on some well known problems in discrete geometry. ALGORITHMIC PROBLEMS CONCERNING FIRST-ORDER DEFINABILITY OF MODAL FORMULAS ON THE CLASS OF ALL FINITE FRAMES

A. V. Chagrov (Tver State Univ., Russia.) and L. A. Chagrova (Tver State Univ., Russia.) Mar. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-07; ETN-94-95552) Avail: Issuing Activity (European Space Agency (ESA))

The problem of describing the 'behavior' of modal, or other propositional intensional formulas on the class of finite frames seems rather natural. Almost all modal logics resulting from formulation of substantial ideas have turned out to have the finite model property. Moreover, different semantic constructions in the finite case are effectively intertranslatable (there is no incompleteness effect). A result on the undecidability of semantic consequence for finite GL-frames and some generalizations thereof are proved. The main technical lemma shows how to reduce the halting problem for Minsky machines to the finite frame consequence problem. Technical facts about first order definability of modal formulas are proved. Formulas

closely connected with the constructions are presented, which have no first order equivalents on the class of finite frames. Results are combined to obtain short proofs of the undecidability of various problems connected with first order definability on the class of finite frames. Two notions of first order definability are considered, a 'local' one and a 'global' one. A problem concerning the difference between global and local definability on the class of all transitive frames is decided. ESA

N94-30384 Amsterdam Univ. (Netherlands). Dept. of Mathematics and Computer Science.

REMARKS ON THE THEORY OF SEMI-FUNCTORS

Raymond Hoofman and Ieke Moerdijk Mar. 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-08; ETN-94-95553) Avail: CASI HC A03

By establishing an appropriate equivalence, it is shown that the theory of semi-functors can be fully embedded in the theory of (ordinary) functors. As a result, standard properties and constructions on functors extend automatically to semi-functors. ESA

N94-30385 Amsterdam Univ. (Netherlands). Dept. of Mathematics and Computer Science.

NATURAL DEDUCTION FOR INTUITIONISTIC LINEAR LOGIC

A. S. Troelstra 14 Apr. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-09; ETN-94-95554) Avail: CASI HC A03

Two versions of the fragment with unit, tensor, linear implication and storage operator (the exponential) of intuitionistic linear logic, are addressed. The first version, ILL, appears in a paper by Benton, Bierman, Hyland and de Paiva; the second one, ILL+, is described. ILL has a contraction rule and an introduction rule ! for the exponential; in ILL+, instead of a contraction rule, multiple occurrences of labels for assumptions are permitted under certain conditions; moreover, there is a different introduction rule for the exponential, ! +, which is closer in spirit to the necessitation rule for the normalizable version of S4 discussed by Prawitz in his monograph 'Natural deduction'. t is relatively easy to adapt Prawitz's treatment of natural deduction for intuitionistic logic to ILL+; in particular, a notion of strong validity permitting a proof of strong normalization can be formulated. The conversion rules for ILL explicitly mentioned in the paper by Benton et al. do not suffice for normal forms with subformula property, but it can be shown that this can be remedied by addition of a single conversion rule. ILL+ also suggests the study of a class of categorical models, more special than the class introduced by Benton et al. ESA

N94-30393 Utrecht State Univ. (Netherlands). Dept. of Computer Science.

A NOTE ON THE SMYTH POWERDOMAIN CONSTRUCTION

Peter Knijnenburg Jan. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-93-02; ETN-94-95639) Avail: CASI HC A02

A representation for the Smyth powerdomain is defined, using minimal representatives, rather than maximal ones. A review of domain theory and the chain completion method is given and the method is used to define the Smyth powerdomain. The construction immediately gives rise to a collection of subsets of the underlying domain which are again Smyth pre-ordered. This is not trivial: in the Plotkin powerdomain construction the Egli-Milner order on the finite elements 'becomes' the Plotkin order on the infinite ones. Minimal representatives for the equivalence classes for the pre-order are defined, and it is shown how continuous functions on the underlying domain lift to continuous functions on the Smyth powerdomain. ESA

ALGEBRAIC DOMAINS, CHAIN COMPLETION, AND THE PLOTKIN POWERDOMAIN CONSTRUCTION

Peter Knijnenburg Jan. 1993 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-93-03; ETN-94-95640) Avail: Issuing Activity (European Space Agency (ESA))

A review of the Plotkin powerdomain construction over algebraic cpo's is given. Algebraic cpo's are cpo's that are completely determined by their collection of finite elements. It is shown how an algebraic cpo can be built out of any preordered set using the method of chain completion. This method is applied to define the powerdomain over an algebraic cpo. It is shown how to interpret this powerdomain as a subset of the powerset of the base domain together with a suitable ordering relation. This ordering relation is the Plotkin order and it extends the Egli-Milner order. A necessary and sufficient condition on the base domain to ensure that the Plotkin order and the Egli-Milner order coincide is given. It is shown how to construct continuous functions between powerdomains out of functions between the underlying base domains. It follows that the powerdomain construction is a continuous functor on the category of algebraic cpo's. ESA

COMMUTATIVE LAMBEK CATEGORIAL GRAMMARS

Maciej Kandulski (Adam Mickiewicz Univ., Poznan, Poland.) Jan. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0928-3315)

(ML-93-01; ETN-94-95546) Avail: CASI HC A03

The problem of establishing the generative power of Categorical Grammars (CG's) based on the Nonassociative and Commutative Lambek calculus with product (NCL) is addressed. It is proved that the class of languages generated by CG's based on NCL coincides with the class of CF languages of finite degree whose rules are closed with respect to permutation (CF(bar) languages). To establish the inclusion of the class of NCL languages in the class of CF(bar) languages, the notion of normal form of derivation which already proved useful in investigations concerning generative power of categorial grammars is employed. The proof of the converse inclusion makes use of an algebraic characterization of phrase languages generated by classical (Ajdukiewicz) CG's and CF grammars. ESA

THE CONJOINABILITY RELATION IN LAMBEK CALCULUS IN LINEAR LOGIC

Mati Pentus (Moscow State Univ., Russia.) Feb. 1993 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract NF-102/62-356) (ISSN 0928-3315)

(ML-93-03; ETN-94-95548) Avail: Issuing Activity (European Space Agency (ESA))

In 1958 J. Lambek introduced a calculus L of syntactic types and defined an equivalence relation on types: 'x is equivalent to y means that there exists a sequence x = x(sub 1),..., x(sub n) = y (n greater than or equal to 1), such that x(sub i) implies x(sub i + 1) or x(sub i + 1) implies x(sub i) (i greater than or equal to 1 and less than n).' He pointed out that x is equivalent to y if and only if there is join z such that x implies z and y implies z. An effective characterization of this equivalence for the

Lambek calculi L and LP, and for the multiplicative fragments of Girard's and Yetter's linear logics, is given. For the non directed Lambek calculus LP and the multiplicative fragment of Girard's linear logic, linear time algorithms deciding whether two types are equal, and finding a join for them if they are, are presented. REPRESENTATIONS OF DYNAMICAL SYSTEMS DESCRIBED BY BEHAVIORAL INEQUALITIES

A. A. tenDam 12 Oct. 1992 14 p Presented at the European Control Conference, Groningen, Netherlands, 28 Jun. - 1 Jul. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-B173649; NLR-TP-92408-U; ETN-94-95595) Avail: CASI HC A03

Dynamical systems described by inequalities are considered from a behavioral point of view. The notions convex, conical, and polyhedral are introduced for the manifest behavior. Systems described by difference inequalities are introduced and redundancy, implicit equalities, and minimal representations are discussed. The class of unimodular polynomical matrices for systems described by difference inequalities is introduced. ESA

ISOMORPHISMS BETWEEN PREDICATE AND STATE TRANSFORMERS

Marcello Bonsangue (Center for Mathematics and Computer Science, Amsterdam, Netherlands.) and Joost N. Kok Mar. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grant CNR-203.15.3) (ISSN 0924-3275)

(RUU-CS-93-09; ETN-94-95646) Avail: CASI HC A03

The relation between state transformers based on directed complete partial orders and predicate transformers is studied. Concepts like 'predicate,' 'liveness,' 'safety,' and 'predicate transformers' are formulated in a topological setting. State transformers based on the Hoare, Smyth, and Plotkin powerdomains are addressed and continuous, monotonic, and unrestricted functions are considered. The transformers are related by isomorphisms thereby extending and completing earlier results and giving a complete picture of all the relationships. ESA

MINIMUM FILL-IN FOR CHORDAL BIPARTITE GRAPHS

T. Kloks Mar. 1993 12 p Sponsored by Netherlands Foundation for Computer Science

(ISSN 0924-3275)

(RUU-CS-93-11; ETN-94-95648) Avail: CASI HC A03/MF A01

Chordal bipartite graphs are exactly those bipartite graphs in which every cycle of length at least six has a chord. The 'minimum fill-in' problem is the problem of finding a chordal embedding of the graph with a minimum number of edges. A polynomial time algorithm for the exact computation of the minimum fill-in for all chordal bipartite graphs is presented. ESA

N94-30405# Utrecht State Univ. (Netherlands). Dept. of Computer Science.

TREEWIDTH OF CIRCLE GRAPHS

T. Kloks Mar. 1993 13 p Sponsored by Netherlands Foundation for Computer Science

(ISSN 0924-3275)

(RUU-CS-93-12; ETN-94-95649) Avail: CASI HC A03/MF A01

A study showing that the treewidth of a circle graph can be computed in polynomial time is presented. A circle graph is a graph that is isomorphic to the intersection graph of a finite collection of chords of a circle. The treewidth problem can be viewed upon as the problem of finding a chordal embedding of the graph that minimizes the maximum clique size. The algorithm to determine the treewidth of a circle graph can be implemented to run in O(n cubed) time, where n is the number of vertices of the graph. ESA

L(SUB)p OPTIMAL d DIMENSIONAL TRIANGULATIONS FOR PIECEWISE LINEAR INTERPOLATION: A NEW RESULT ON DATA DEPENDENT TRIANGULATIONS

Elefterios A. Melissaratos Apr. 1993 19 p Sponsored by Netherlands Organization for Scientific Research, and EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0924-3275)

(RUU-CS-93-13; ETN-94-95650) Avail: CASI HC A03

The problem of optimum piecewise linear approximation of general quadratic functions in R(sup d) for d greater than or equal to 2 is addressed. In particular the problem is posed as follows: given a quadratic function f : R(sup d) to R of the form f(x) = x(sup tau)Ax + b(sup tau)x + c, where matrix A symmetric and positive definite and x is a member of R(sup d). Let X (x(sub 1), x(sub 2), ..., x(sub n)) a set of n points in R(sup d) and let F = (f(sub 1), f(sub 2), ..., f(sub n)) the set of values of function f at each of the points in the set X (i.e., f(x(sub i)) = f(sub i) for i = 1, 2, ..., n). For each triangulation T of the convex hull CH(X) of X and for each set of corresponding values F there exists a unique piecewise linear funciton pi(sub F)(sup T) : R(sup d) to R wich approximates function f. The problem of finding a triangulation T(sub 0) of CH(X) is addressed such that pi(sub F)(sup T(sub 0)) best approximates f with respect to the L(sub p) error in any finite dimension d. ESA

SHAPE FROM DIAMETER: NEGATIVE RESULTS

Anil S. Rao and Kenneth Y. Goldberg Apr. 1993 25 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grant NSF IRI-91-23747) (ISSN 0924-3275)

(RUU-CS-93-16; ETN-94-95653) Avail: Issuing Activity (European Space Agency (ESA))

A study with the objective to automatically recognize parts in a structured environment (such as a factory) using inexpensive and widely available hardware is presented. The planar problem of determining the convex shape of a polygonal part from a sequence of projections is considered. Projecting the part onto an axis in the plane of the part produces a scalar measure, the diameter, which is a function of the angle of projection. The diameter of a part at a particular angle can be measured using an instrumented parallel-jaw gripper. The negative result that shape cannot be uniquely recovered is presented: for a given set of diameter measurements, there is an (uncountably) infinite set of polygonal shapes consistent with these measurements. Since most of these shapes have parallel edges of varying lengths, the related problem of identifying a representative polygon with no parallel edges is also considered. It is shown that given a diameter function, deciding whether such a polygon exists is NP complete. ESA

SHAPE FROM DIAMETER: POSITIVE RESULTS

Anil S. Rao and Kenneth Y. Goldberg Apr. 1993 25 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grant NSF IRI-91-23747) (ISSN 0924-3275)

(RUU-CS-93-17; ETN-94-95654) Avail: CASI HC A03

A study with the objective to automatically recognize parts in a structured environment (such as a factory) using inexpensive and widely available hardware is presented. The planar problem of determining the convex shape of a polygonal part from a sequence of projections is considered. Projecting the part onto an axis in the plane of the part produces a scalar measure, the diameter, which is a function of the angle of projection. The diameter of a part at a particular angle can be measured using an instrumented parallel-jaw gripper. Previously presented negative results motivate consideration to the problem of recognizing a part from a known (finite) set of parts. Given a set of polygonal parts with a total of N faces, can the shortest sensing plan for disambiguating the parts be found. Only diameters at n less than or equal to N stable faces can be measured. An internal representation of these stable diameters in O(N + (n cubed)) time is constructed, and two planning algorithms are given: one constructs an

optimal sensing plan in time O(n(exp 4) 2(exp n)), the other constructs a suboptimal sensing plan in time O((n squared) log n). Neither plan requires more than n measurements. ESA

EVENT STRUCTURES AND ORTHOGONAL TERM GRAPH REWRITING
J. R. Kennaway (East Anglia Univ., Norwich, England.), J. W. Klop, M. R. Sleep, and F. J. deVries Jul. 1993 22 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant SERC-GR/F-91582) (ISSN 0169-118X)
(CWI-CS-R9347; ETN-94-95689) Copyright Avail: CASI HC A03

For every normalizable term in an orthogonal term graph rewrite system, an elementary event structure is constructed. Its events are the essentially different redexes which must be reduced to reach the normal form of the term. The associated state domain is the set of Levy equivalence classes of needed reduction sequences starting from the term. Various properties of the event structure and state domain are related to properties of the term. The problems arising in extending this work to term rewrite systems and non orthogonal rewrite systems are also discussed. ESA

A strategy that, for any given term t in an Orthogonal Combinatory Reduction System (OCRS) (that is, a term rewriting system with bound variables and substitutions), constructs a longest reduction starting from t if t is strongly normalizable, and constructs an infinite reduction otherwise, is designed. A method for finding the least upper bound of lengths of reductions starting from a strongly normalizable term is developed. Properties of pure substitutions and several kinds of similarity of redexes are studied. These results are applied to construct an algorithm for finding lengths of longest reductions in 'strongly persistent' OCRS's. As a corollary, there is an algorithm for finding lengths of longest developments in orthogonal CRS's. ESA

TERMINATION OF TERM REWRITING BY SEMANTIC LABELLING
H. Zantema Jul. 1993 19 p Revised Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-93-24; RUU-CS-92-38; ETN-94-95661) Avail: Issuing Activity (European Space Agency (ESA))

A transformation of TRS (term rewriting system) is proposed, depending on a choice for a model for the TRS. The labeled TRS is obtained from the original one by labeling operation symbols, possibly creating extra copies of some rules. This construction has the remarkable property that the labeled TRS is terminating if and only if the original TRS is terminating. Although the labeled version has more operation symbols and may have more rules (sometimes infinitely many), termination is often easier to prove for the labeled TRS than for the original one. This provides a technique for proving termination, making classical techniques like RPO (recursive path order) and polynomial interpretations applicable for nonsimplifying TRS. ESA

RECTILINEAR DECOMPOSITIONS WITH LOW STABBING NUMBER
Mark deBerg and Marc vanKreveld Jul. 1993 13 p Sponsored by Netherlands Organization for Scientific Research; EEC; and Natural Sciences and Engineering Research Council, Canada Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-93-25; ETN-94-95662) Avail: Issuing Activity (European Space Agency (ESA))

Let P be a rectilinear polygon. The stabbing number of a decomposition of P into rectangles is the maximum number of rectangles intersected by any axis parallel segment that lies completely inside P. A proof that any simple rectilinear polygon with n vertices admits a decomposition with stabbing number O(log n) and an example of a simple rectilinear polygon for which any decomposition has stabbing number Omega(log n) are given. It is shown that any rectilinear polygon with k greater than or equal to 1 rectilinear holes and n vertices in total admits a decomposition with stabbing number O((square root of k)(log n)). When the holes are rectangles, then a decomposition exists with stabbing number O((square root of k) + (log n)), which is shown to be tight. All the above decompositions consist of O(n) rectangles. THREE METRIC DOMAINS OF PROCESSES FOR BISIMULATION
Franck vanBreugel (Vrije Univ., Amsterdam, Netherlands.) Jun. 1993 20 p Presented at the 9th Conference on the Mathematical Foundations of Programming Semantics, New Orleans, LA, 7-10 Apr. 1993 Submitted for publication Sponsored in part by Netherlands Nationale Faciliteit InformaticaPro gramme Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9335; ETN-94-95677) Copyright Avail: CASI HC A03

A metric domain of processes is presented. This domain is located in between two metric process domains introduced by De Bakker and Zucker. The process domain characterizes the collection of image finite processes. This domain has as advantages over the other process domains that no complications arise in the definitions of operators like sequential composition and parallel composition, and that image finite language constructions like random assignment can be modeled in an elementary way. As in the other domains, bisimilarity and equality coincide in this domain. The three domains are obtained as unique (up to isometry) solutions of equations in a category of 1 bounded complete metric spaces. In the case the action set is finite, the three domains are shown to be equal (up to isometry). For infinite action sets, for example equipollent to the set of natural or real numbers, the process domains are proved not to be isometric. ESA

HOMOMORPHISM PRESERVING ALGEBRAIC SPECIFICATIONS REQUIRE HIDDEN SORTS
J. A. Bergstra (Amsterdam Univ., Netherlands.) and J. Heering Jul. 1993 15 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9344; ETN-94-95686) Copyright Avail: CASI HC A03

Although every computable data type has an initial algebra specification with hidden functions, it may happen that some of the homomorphic images of the data type are not models of the specification. The latter are reducts of algebras that would be models of the specification if all its functions were visible, whereas the homomorphic images of the data type are independent of the specification and need not be compatible with the hidden functions used in it. A hidden function specification that does not exclude any of the homomorphic images of its initial model from its model

class is termed homomorphism preserving. It turns out that, unlike unrestricted initial algebra specification, homomorphism preserving initial algebra specification of computable data types requires both hidden sorts and hidden functions. ESA

FURTHER INVESTIGATION OF CURVE VEERING PHENOMENA Ph.D. Thesis
Jeenhuei Tsai 1993 246 p
Avail: Univ. Microfilms Order No. DA9325602

For an eigenvalue problem, if loci are plotted by eigenvalue versus certain system parameters, the phenomenon of curve veering, which is characterized by the continuous alternation of eigenfunctions associated with the continuous variation of eigenvalues, may show. One dimensional (string and beam), two-dimensional (rectangular membrane and plate), and three-dimensional (thick circular plate and solid cylinder) problems are considered. The Galerkin method, the finite difference method, and the three-dimensional Ritz method are used for approximate solutions. Exact closed form solutions are also available in some problems. Unlike previous studies, not all approximate methods would generate this kind of occurrence. The finite difference method is a typical example. On the other hand, the problems with closed form solutions also exhibit curve veering. More importantly, the existence of curve veering in three-dimensional problems, which require no kinematic assumptions, may prove it to be in reality. The theory by Perkins and Mote is examined and found to be applicable to some problems only. Dissert. Abstr.

PIECEWISE LINEAR PATHS AMONG CONVEX OBSTACLES
Mark deBerg, Jiri Matousek, and Otfried Schwarzkopf May 1993 26 p Sponsored in part by Netherlands Organization for Applied Scientific Research; Commission of the European Communities; and Alexander van Humboldt Foundation Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-93-20; ETN-94-95657) Avail: CASI HC A03

Let B be a set of n arbitrary (possibly intersecting) convex obstacles in R(sup d). It is shown that any two points which can be connected by a path avoiding the obstacles can also be connected by a path consisting of O(n(sup d - 1)(sup d/2 + 1)) segments. The bound cannot be improved below Omega(n(sup d)), thus in R cubed, the answer is between n cubed and n to the 4th power. For open disjoint convex obstacles, a Theta(n) bound is proved. By a well known reduction, the general case result also upper bounds the complexity for a translational motion of an arbitrary convex robot among convex obstacles. In the planar case, asymptotically tight bounds and efficient algorithms are given. ESA

PERFECT BINARY SPACE PARTITIONS
Mark deBerg, Marko deGroot, and Mark H. Overmars Jul. 1993 15 p Sponsored in part by Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract EC-7141) (ISSN 0924-3275)
(RUU-CS-93-23; ETN-94-95660) Avail: CASI HC A03

Results on perfect binary space partitions on sets of nonintersecting line segments in two dimensions are discussed. A binary space partition is a scheme for recursively dividing a configuration of objects by hyperplanes until all objects are separated. A binary space partition is called perfect when none of the objects is cut by the hyperplanes used by the binary space partition. Given a set of n nonintersecting line segments, the method constructs a perfect binary space partition, or decides that no perfect binary space partition exists for the arrangement of line segments, in O((n squared)(log n)) time. Elementary (first order) and non-elementary (set theoretic) aspects of the largest bisimulation are considered with a view towards analyzing operational semantics from the perspective of predicate logic. The notion of a bisimulation is employed in two distinct ways: as an extensional notion of equivalence on programs (or processes) generalizing input/output equivalence (at a cost exceeding Pi(sub 1)(sup 1) over certain transition predicates computable in log space); and as a tool for analyzing the dependence of transitions on data (which can be shown to be elementary or non-elementary, depending on the formulation of the transitions). These ways contrast not only in the logical dependence they uncover, but also in their use of sets as abstractions describing mechanical computation. ESA

DISSIPATION IN HAMILTONIAN SYSTEMS: DECAYING CNOIDAL WAVES
G. L. A. Derks and E. W. C. vanGroesen 30 Jul. 1993 24 p Sponsored by Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-2690)
(MEMO-1151; ETN-94-95725) Avail: CASI HC A03

A perturbed Hamiltonian system is investigated by using the family of relative equilibria of the unperturbed Hamiltonian system. Solutions of a Hamiltonian system with dissipation, starting near a relative equilibrium, are approximated with the relative equilibria. The approximation for the Hamiltonian system with dissipation consists of a quasistatic succession of relative equilibria. A main subject is the investigation of the conditions for which the quasistatic approximation can be justified, even in case the eventual deviation from the initial state, caused by the small perturbation, is large. These general ideas are illustrated for the specific example of the uniformly damped Korteweg de Vries equation with periodic boundary conditions. The relative equilibria of the Korteweg de Vries equation are space periodic soliton-like waves, known as cnoidal waves. It is shown that the difference in shape of a solution and a quasistatic approximation is at each instant of the order of the damping rate times the norm of the cnoidal wave. ESA

TOTAL TERMINATION OF TERM REWRITING

M. C. F. Ferreira and H. Zantema Dec. 1992 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-92-42; ETN-94-95632) Avail: CASI HC A03

An investigation on proving termination of term rewriting systems (TRS) by interpretation of terms in a compositional way in a total well founded order is presented. This kind of termination is called total termination. On one hand it is more restrictive than simple termination, on the other it generalizes most of the usual techniques for proving termination. For total termination it turns out that below epsilon(sub 0) the only orders of interest are built from the natural numbers by lexicographic product and the multiset construction. By examples, both constructions are shown to be essential. For a wide class of term rewriting systems, total termination is proved to be a modular property. Most of the techniques are based on ordinal arithmetic. ESA

THE (n SQUARED)-HARD PROBLEMS IN COMPUTATIONAL GEOMETRY
Anka Gajentaan and Mark H. Overmars Apr. 1993 25 p Sponsored in part by EEC, and Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-93-15; ETN-94-95652) Avail: CASI HC A03

There are many problems in computational geometry for which the best known algorithms take time Theta(n squared) (or more) in the worst case, while only very low lower bounds are known. A large class of so called n squared hard problems for which it is proved that they are all at least as difficult as the following base problem is described: given a set S of n integers, are there three elements of S that sum up to 0. The best known algorithm for this base problem takes Theta(n squared) time. The class includes problems like: given a set of lines in the plane, are there three that meet in a point; or given a set of triangles in the plane, does their union have a hole. Also certain visibility and motion planning problems are n squared hard. Although this does not prove a lower bound for these problems, there is no hope of obtaining omicron(n squared) solutions for them unless the solution for the base problem can be improved. ESA

EVALUATION OF DISCRETIZATION SCHEMES FOR ADVECTION-DIFFUSION EQUATIONS
B. Koren and C. B. Vreugdenhil Jul. 1993 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(CWI-NM-R9311; ETN-94-95668) Copyright Avail: Issuing Activity (European Space Agency (ESA))

A comparative study is made of accuracy, monotonicity, conservation, and computational efficiency, for a wide variety of advection diffusion schemes. The evaluation is based on a set of scalar test problems with known exact solutions: an unsteady, linear one dimensional advection diffusion problem; a steady, linear one dimensional advection diffusion problem with source term; an unsteady, nonlinear one dimensional advection problem (with and without discontinuity); and an unsteady, linear two dimensional advection problem. A STRUCTURAL CO-INDUCTION THEOREM
J. J. M. M. Rutten Jul. 1993 20 p Presented at the 9th Conference on the Mathematical Foundations of Programming Semantics, New Orleans, LA, 7-10 Apr. 1993 Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9346; ETN-94-95688) Copyright Avail: CASI HC A03

The structural induction theorem (Lehmann and Smyth; Plotkin) characterizes initial F algebra's of locally continuous functors F on the category of CPO's with strict and continuous maps. A dual of that theorem is presented, giving a number of equivalent characterizations of final coalgebras of such functors. In particular, final coalgebras are order strongly extensional (sometimes called internal full abstractness): the order is the union of all (ordered) F bisimulations. (Since the initial fixed point for locally continuous functors is also final, both theorems apply). A similar co-induction theorem is given for a category of complete metric spaces and locally contracting functors. ESA

ON SOME GENERAL PROPERTIES OF PARABOLIC CONSERVATION EQUATIONS
L. Dresner Oct. 1993 56 p
(Contract DE-AC05-84OR-21400)
(DE94-006101; ORNL/TM-12509) Avail: CASI HC A04/MF A01

This report deals with certain general properties of partial differential equations of the form S(c)c(sub t) + q(sub z) = Q(c), where t may thought of as time, z as distance, c as an intensive quantity (e.g., temperature), q is its flux (e.g., heat flux), and where q depends on both c and c(sub z). Six topics are studied: mMaximum and minimum principles; ordering of solutions; invariance to stretching (affine) groups; stability of steady states; comparability of solutions; and traveling wave solutions. Illustrative examples are given from the field of nonlinear diffusion, applied superconductivity, and helium cryogenics. DOE

(MEMO-1145; ETN-94-95719) Avail: CASI HC A03

For a graph G, p(G) denotes the order of a longest path in G and c(G) the order of a longest cycle. It is shown that if G is a connected graph on n greater than or equal to 3 vertices such that d(u) + d(v) + d(w) is greater than or equal to n for all triples u, v, w of independent vertices, then G satisfies c(G) greater than or equal to p(G) - 1, or G is in one of six families of exceptional graphs. This generalizes results in Bondy, and in Bauer, Morgana, Schmeichel and Veldman. ESA

To learn (or generalize) from noisy data, one must resist the temptation to pick a model for the underlying process that overfits the data. Many existing techniques solve this problem at the expense of requiring the evaluation of an absolute, a priori measure of each model's complexity. We present a method that does not. Instead, it uses a natural, relative measure of each model's complexity. This method first creates a pool of 'simple' candidate models using part of the data and then selects from among these by using the rest of the data. DOE

(Contract DE-AC04-94AL-85000)
(DE94-006257; SAND-93-2665) Avail: CASI HC A03/MF A01

Many safety (risk) analyses depend on uncertain inputs and on mathematical models chosen from various alternatives, but give fixed results (implying no uncertainty). Conventional uncertainty analyses help, but are also based on assumptions and models, the accuracy of which may be difficult to assure. Some of the models and assumptions that on cursory examination seem reasonable can be misleading. As a result, quantitative assessments, even those accompanied by uncertainty measures, can give unwarranted impressions of accuracy. Since analysis results can be a major contributor to a safety-measure decision process, risk management depends on relating uncertainty to only the information available. The uncertainties due to abnormal environments are even more challenging than those in normal-environment safety assessments, and therefore require an even more cautious approach. A fuzzy algebra analysis is proposed in this report that has the potential to appropriately reflect the information available and portray uncertainties well, especially for abnormal environments. TERMINATION OF TERM REWRITING BY SEMANTIC LABELLING
H. Zantema Dec. 1992 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0924-3275)
(RUU-CS-92-38; ETN-94-95628) Avail: CASI HC A03

A kind of transformation of TRS (Term Rewriting System(s)) is proposed, depending on a choice for a model for the TRS. The labelled TRS is obtained from the original one by labelling operation symbols, possibly creating extra copies of some rules. This construction has the remarkable property that the labelled TRS is terminating if and only if the original TRS is terminating. Although the labelled version has more operation symbols and may have more rules (sometimes infinitely many), termination is often easier to prove for the labelled TRS than for the original one. This provides a new technique for proving termination, making classical techniques like RPO (Recursive Path Order) and polynomial interpretations applicable for nonsimplifying simplifying TRS. ESA

OPTIMAL SIZE FINITE ELEMENT MESHES WITHOUT OBTUSE AND SMALL ANGLES
Elefterios A. Melissaratos (Rutgers Univ., New Brunswick, NJ.) Dec. 1992 47 p Sponsored in part by Netherlands Organization for Scientific Research, and EEC
(Grants NSF CCR-88-03549; NSF CCR-91-0473; NSF STC-88-09648)
(ISSN 0924-3275)
(RUU-CS-92-39; ETN-94-95629) Avail: CASI HC A03/MF A01

An algorithm which produces 'quality' triangulations of polygonal domains with holes, for the Finite Element Method (FEM), is introduced. Quality triangulation is used to mean satisfaction of both of the following conditions: (1) no obtuse angles; (2) no 'small' angles. Triangulations satisfying only (1) are termed as 'non obtuse'; those satisfying only (2) are termed as 'non-small angle'; and those which satisfy both conditions are termed as 'nice'. The main contributions of the study are: new techniques to produce nice triangulations of polygonal domains with holes using nonuniform (quadtree) underline square grid; it is shown that the asymptotic size of a nice triangulation is the same as for a non-small angle triangulation. In other words, achieving both non-obtuse and non-small angle condition at the same time is not more expensive than achieving only the non-small angle condition. ESA

NON-COMMUTATIVE GEOMETRY
A. Connes Oct. 1993 523 p See also PB93-215499
(PB94-139342; IHES/M-93/54) Avail: Issuing Activity (National Technical Information Service (NTIS))

The correspondence between geometric spaces and commutative algebras is a familiar and basic idea of algebraic geometry. The purpose of this book is to extend this correspondence to the non-commutative case in the framework of real analysis. The theory, called non-commutative geometry, rests on two essential points: (1) The existence of many natural spaces for which the classical set theoretic tools of analysis, such as measure theory, topology, calculus, and metric ideas lose their pertinence but which correspond very naturally to a non-commutative algebra. Such spaces arise both in mathematics and in quantum physics, and we shall discuss them in more detail below. Moreover, even for classical spaces, which correspond to a commutative algebra, the new point of view will give new tools and results, for instance for the Julia sets of iteration theory. (2) The extension of the classical tools--measure theory, topology, differential calculus and Riemannian geometry, to the non-commutative situation--is also presented. This extension involves an algebraic reformulation of the above tools but passing from the commutative to the non-commutative case is never straightforward. NTIS

AN INTRINSIC HAMILTONIAN FORMULATION OF THE DYNAMICS OF LC-CIRCUITS
B. M. Maschke (Conservatoire National des Arts et Metiers, Paris, France.), A. J. vanderSchaft, and P. C. Breedveld Aug. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-2690)
(MEMO-1154; ETN-95728) Avail: CASI HC A03

The dynamics of LC circuits is formulated as a Hamiltonian system with respect to a Poisson structure which may be degenerate, that is, non symplectic. This Poisson structure is deduced from the network graph of the circuit and captures the dynamic invariants due to Kirchhoff's laws. The antisymmetric relation defining the Poisson structure is realized as a physical network using the gyrator element and partially dualizing the network graph constraints. From the network realization of the Poisson structure, the reduced symplectic Hamiltonian system and the realization of the embedding symplectic Hamiltonian system are deduced. ESA

THE STROEMBERG WAVELET ON THE INTERVAL AND THE FRANKLIN SYSTEM
K. Drouiche and D. Kateb 28 Apr. 1993 19 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0751-1337)
(TELECOM-93-C-002; ETN-94-95977) Avail: CASI HC A03

Tha Franklin system is an orthonormal basis of interval L(sup 2)(0,1). A multiresolution analysis of interval L(sup 2)(0,1) is given, and it is shown how this system can be interpreted as a special basis of Stroemberg wavelets on the interval (0,1). A fast algorithm which enables a given signal on an interval to be analyzed and synthesized is derived. Special considerations are held near the edges, where the extension of the interval is no longer needed (zero padding method, etc.). The error term, due to the edge effects, is calculated and injected in the reconstruction formulas to recover the exact original signal. Numerical simulations are provided to emphasize the performance of the results. ESA

REMARKS ON UNIFORMLY FINITELY PRECOMPLETE POSITIVE EQUIVALENCES
V. Y. Shavrukov 1 Aug. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3315)
(ML-93-12; ETN-94-95988) Avail: Issuing Activity (European Space Agency (ESA))

Miscellaneous results and observations on three classes of equivalences are documented. The necessary definitions and notations are introduced and an exposition of earlier results to be built on is given. Partial isomorphisms (that is, isomorphisms of domains of proper subobjects) between e and between precomplete equivalences are addressed. These partial isomorphisms are shown to enjoy strong, and, in a way, complementary extendability properties. A property that singles out the e and the precomplete positive equivalences among all the uniformly, finitely precomplete ones is formulated. The effort spent was not objectless in that there exist uniformly finitely positive equivalences that are neither e nor precomplete. Sets of fixed points of endomorphisms of uniformly finitely precomplete positive equivalences are described. ESA

EMBEDDINGS OF HEYTING ALGEBRAS
Dick deJongh and Albert Visser Sep. 1993 31 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0928-3315)
(ML-93-14; ETN-94-95990) Avail: CASI HC A03

Embeddings of Heyting algebras are studied. It is pointed out that such embeddings are naturally connected with derived rules. The Heyting algebras embeddable in the Heyting algebra of the Intuitionistic Propositional Calculus (IPC), that is, the free Heyting algebra on countably, infinitely many generators, and those embeddable in the Heyting algebra of Heyting's Arithmetic (HA), are compared. A partial result is obtained. Every recursively enumerable prime Heyting algebra is shown to be embeddable in the Heyting Algebra of HA(*) a 'natural' extension of HA. ESA

My research over this period has focused on the theory and application of nonlinear time series forecasting. The purpose of time series forecasting is to predict apparently random behavior about which we have little or no knowledge. A time series is a set of values that change in time, for example, daily stock market prices for a given set of firms, or the volume of the polar ice caps over the last two million years. Recent developments in the understanding of chaotic dynamical systems have stimulated new approaches to time series analysis. These results raise the possibility that apparently random behavior may essentially be the consequence of chaotic behavior of deterministic equations with a small number of variables. My main research effort has been to develop a theory of nonlinear time series forecasting which applies to chaotic time series with low levels of observational noise. I have also developed a new algorithm for analyzing experimental time series data in order to determine whether a nonlinear deterministic, as opposed to nonlinear stochastic model is an appropriate description of the data, and have applied this algorithm to a wide range of time series data. In addition to involvement in these and other research activities, I have helped organize a conference on nonlinear modeling and forecasting, jointly sponsored by NATO and SFI. I describe the above projects in more detail in the following paragraphs. Several of these projects benefited greatly fro the excellent computer facilities available at SFI. DOE

A FAMILY OF JOINT PROBABILITY MODELS FOR COST AND SCHEDULE UNCERTAINTIES
Paul R. Garvey Sep. 1993 47 p Presented at the 27th Annual DOD Cost Analysis Symposium Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275513) Avail: CASI HC A03

This paper discusses a family of analytical models from which the joint probability of total program cost and schedule can be calculated, analyzed, and presented to decision-makers. Specifically, the classical bivariate normal and two lesser known joint distributions, the normal-lognormal and the bivariate lognormal distributions are discussed. Experiences from Monte Carlo simulations suggest that this family of bivariate distributions are candidate models for computing joint and conditional cost and schedule probabilities. In particular, the discussion on the normal-lognormal distribution as a joint cost-schedule probability model extends research on the applicability of the bivariate lognormal presented last year. USING MULTIPLE SEARCHERS TO LOCATE A RANDOMLY MOVING TARGET M.S. Thesis
Almir G. Santos 23 Sep. 1993 56 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275602) Avail: CASI HC A04

The need to search effectively for objects presents itself in many civilian and military applications. This thesis develops and tests six heuristics and an optimal branch and bound procedure to solve the heretofore

uninvestigated problem of searching for a Markovian moving target using multiple searchers. For more than one searcher, the time needed to guarantee an optimal solution for the problems considered is prohibitive. The heuristics represent a wide variety of approaches and consist of two based on the expected number of detections, two genetic algorithm implementations, one based on solving partial problems optimally, and local search. A heuristic based on the expected number of detections obtains solutions within two percent of the best known solution for each one, two, and three searcher test problem considered. For one and two searcher problems, the same heuristic's solution time is less than that of other heuristics considered. A genetic algorithm implementation performs acceptably for one and two searcher problems and highlights its ability, effectively solving three searcher problems in as little as 20% of other heuristic run-times. TESTING FOR A SIGNAL WITH UNKNOWN LOCATION AND SCALE IN A STATIONARY GAUSSIAN RANDOM FIELD
David O. Siegmund and Keith J. Worsley 7 Jan. 1994 40 p
(Contract N00014-92-J-1264; NSF DMS-91-04432)
(AD-A275320; TR-477) Avail: CASI HC A03/MF A01

We suppose that our observations can be decomposed into a fixed signal plus random noise, where the noise is modelled as a particular stationary Gaussian random field in N-dimensional Euclidean space. The signal has the form of a known function centered at an unknown location and multiplied by an unknown amplitude, and we are primarily interested in a test to detect such a signal. There are many examples where the signal scale or width is assumed known, and the test is based on maximizing a Gaussian random field over all locations in a subset of N-dimensional Euclidean space. The novel feature of this work is that the width of the signal is also unknown and the test is based on maximizing a Gaussian width. Two convergent approaches are used to approximate the null distribution: one based on the method of Knowles and Siegmund (1989), which uses a version of Weyl's (1939) tube (1993b), which uses the Hadwiger characteristic of excursion sets as introduced by Adler (1981). Finally we compared the power of our method with one based on a fixed but perhaps incorrect signal width. DTIC

THE MODIFIED CRAMER-VON MISES GOODNESS-OF-FIT CRITERION FOR TIME SERIES
T. W. Anderson and M. A. Stephens 17 Jan. 1994 18 p
(Contract N00014-92-J-1264; NSF DMS-91-04432)
(AD-A275377; TR-478) Avail: CASI HC A03/MF A01

In this paper we consider somewhat analogous quadratic forms in normal variables when the dimensionality is infinite. Then the quadratic forms are distributed infinite weighted sums of X2-variables. These come about as goodness-of-fit criteria for a hypothesis that a cumulative distribution function is a specified one or that two cdf's are the same. Such criteria also arise for goodness-of-fit tests for standardized spectral distributions. As examples, we give tables of the distribution of the criterion for testing the hypothesis that a stationary stochastic process is a given moving average process order 1 and for testing the hypothesis that it is a specified autoregressive process order 1. Two methods are described for calculating the distribution. Either method is appropriate for calculating the distribution of the criterion for testing the hypothesis that a process is a stationary process whose standardized spectral density of distribution is a specified one. DYNAMICS OF DEFECT ENSEMBLES IN ONE-DIMENSIONAL CELLULAR AUTOMATA
K. Eloranta Jun. 1993 24 p Sponsored by Suomen Akatemia
(PB94-136819; ISBN-951-22-1636-1) Avail: Issuing Activity (National Technical Information Service (NTIS))

We investigate the dynamics of ensembles of defects in one-dimensional deterministic cellular automata. In individual confinement the motions from disordered initial state are perfect random walks as shown in a 1992 paper by the author. Here we give a natural condition guaranteeing this also in the presence of other defects. Simple branching and birth mechanisms are introduced, and prototype classes of weakly interacting walks capable of annihilation and coalescence are studied. Their equilibrium behavior is also characterized. The design principles of cellular automata with desired diffusive interaction properties becomes transparent from this analysis. NTIS

U-STATISTICS OF RANDOM-SIZE SAMPLES AND LIMIT THEOREMS FOR SYSTEMS OF MARKOVIAN PARTICLES WITH NON-POISSON INITIAL DISTRIBUTIONS
Raisa E. Feldman and Svetlozar Rachev 1994 21 p
(Contract N00014-89-J-1870; NSF DMS-91-03452)
(AD-A275018) Avail: CASI HC A03/MF A01

Limiting distributions of square-integrable infinite order U-statistics are extended to the case of non-Poisson random sample size. Multiple integrals of non-Gaussian generalized fields are constructed to identify the limiting distributions. An invariance principle is also established. These results are used to study the limiting distribution of the amount of charge left in some set by an infinite system of signed Markovian particles when the initial particle density goes to infinity. By selecting the initial particle distribution, we determine the limiting distribution of charge, constructing different non-Gaussian generalized random fields, including Laplace, alpha-stable, and their multiple integrals. HIERARCHICAL STRUCTURES AND ASYMMETRIC STOCHASTIC PROCESSES ON p-ADICS AND ADELES
W. Warwowski (Wroclaw Univ., Poland.) and R. V. Mendes Dec. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-138203; IHES/M/93/65) Avail: CASI HC A03

The space of states of some phenomena, in physics and other sciences, displays a hierarchical structure. When that is the case, it is natural to label the states by a p-adic number field. Both the classification of the states and their relationships are then based on a notion of distance with ultrametric properties. The dynamics of the phenomena, that is the transition between different states, is also a function of the p-adic distance d(sub p). However, because the distance is a symmetric function, probabilistic processes which depend only on d(sub p) have a uniform invariant probability measure, that is, all states are equally probable at large times. This being a severe limitation for cases of physical interest, we have studied processes with asymmetric transition functions. In addition to the dependence on the ultrametric distance, the asymmetric transition functions are allowed to depend also on the probability of the target state, leading to any desired invariant probability measure. When each state of a physical system is associated to several distinct hierarchical structures or parametrizations, an appropriate labeling set is the ring of adeles. We also construct stochastic processes on the adeles. NTIS

ACCEPTANCE SAMPLING METHODS FOR SAMPLE RESULTS VERIFICATION
C. A. Jesse Jun. 1993 42 p
(Contract DE-AC07-76ID-01570)
(DE94-002882; EGG-ER-10792) Avail: CASI HC A03/MF A01

This report proposes a statistical sampling method for use during the sample results verification portion of the validation of data packages. In particular, this method was derived specifically for the validation of data packages for metals target analyte analysis performed under United States Environmental Protection Agency Contract Laboratory Program protocols, where sample results verification can be quite time consuming. The purpose of such a statistical method is to provide options in addition to the 'all or nothing' options that currently exist for sample results verification. The proposed method allows the amount of data validated during the sample results verification process to be based on a balance between risks and the cost of inspection. DOE

By Probabilistic Safety Assessment (PSA), nuclear power plants are assessed with respect to the likelihood of accidents. PSA provides a structured and logical procedure for the identification of credible accident sequences and for the assessment of their corresponding likelihood. To increase the availability of PSA for the operational safety management, the model as well as the whole PSA program should be developed to a more dynamic tool. The process, to update the PSA model to represent the current or planned configuration and to use the model to evaluate and direct the changes in the configuration, is called the 'living' PSA program. Risk measures needed in the living use of PSA are defined and used in the presentation of the results of the applications to end users who are the plant safety management, operational management maintenance planning personnel, designers and authorities. By proper risk measures, PSA can be better integrated with other safety management methods. Operational or design alternatives can be compared in a more understandable way, and a more effective support can be gained to react to gradual or sudden changes in the operational safety status of the plant. INDEX EXPRESSION BELIEF NETWORKS FOR INFORMATION DISCLOSURE
P. D. Bruza and L. C. vanderGaag Aug. 1992 25 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-23; ETN-94-95612) Avail: Issuing Activity (European Space Agency (ESA))

It is widely accepted that to extend the effectiveness of information disclosure beyond the limitations of current empirically based retrieval systems, some notion of document semantics has to be incorporated onto the retrieval mechanism. An approach to bringing semantics into play is to find information retrieval on the notion of logical inference. This approach is built on, and a promising mechanism for information disclosure, called the Refinement Machine, is described. The Refinement Machine features the index expressions as a language for characterizing information objects and a deduction mechanism driven by rules of inference. Two types of inference rule are distinguished. The rules of strict inference follow the line of traditional logical deduction. As the characterizations of objects are incomplete and requests are typically partial descriptions of the information need, the rules of strict inference are supplemented with a rule of plausible inference. This rule of plausible inference is motivated by work in the area of plausible reasoning in knowledge based systems and, in particular, is derived from the work on belief networks. Details of the Refinement Machine are given and preliminary experimental results are presented. ESA

TEN NEW CHECKS TO ASSESS THE STATISTICAL QUALITY OF MONTE CARLO SOLUTIONS IN MCNP
R. A. Forster, T. E. Booth, and S. P. Pederson 1994 10 p Presented at the 8th International Conference on Radiation Shielding, Arlington, TX, 24-27 Apr. 1994
(Contract W-7405-eng-36)
(DE94-006137; LA-UR-94-227; CONF-940424-8) Avail: CASI HC A02/MF A01

The central limit theorem can be applied to a Monte Carlo solution if the random variable x has a finite mean and a finite variance and the number N of independent observations grows large. When these two conditions are satisfied, a confidence interval based on the normal distribution with a specified coverage probability can be formed. The first requirement is generally satisfied by the knowledge of the type of Monte Carlo tally being used. The Monte Carlo practitioner has only a limited number of marginally quantifiable methods to assess the fulfillment of the second requirement. Ten new statistical checks have been created and added to MCNP4A to assist with this assessment. The checks examine the mean, relative error, figure of merit, and two new quantities: the relative variance of the variance and the empirical history score probability density function f(x). The two new quantities are described. The underlying f(x) for Monte Carlo tallies is calculated for routine inspection and automated analysis. The ten statistical checks are defined, followed by the results from a statistical study on analytic Monte Carlo and other realistic f(x)s to validate their values and uses in MCNP. Passing all ten checks is a reasonable indicator that f(x) has been adequately sampled, N has become large, and valid confidence intervals can be formed. Additional experience with these checks is required to determine their effectiveness in assessing the fulfillment of the central limit theorem requirements for a wide variety of MCNP Monte Carlo solutions. Passing all ten checks does not guarantee a valid confidence interval because there is no guarantee that the entire f(x) has been sampled. DOE

PREDICTION AND STANDARD ERROR ESTIMATION FOR A FINITE UNIVERSE TOTAL WHEN A STRATUM IS NOT SAMPLED
T. Wright Jan. 1994 37 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract DE-AC05-84OR-21400)
(DE94-004929; ORNL/TM-12379) Avail: Issuing Activity (Department of Energy (DOE))

In the context of a universe of trucks operating in the United States in 1990, this paper presents statistical methodology for estimating a finite universe total on a second occasion when a part of the universe is sampled and the remainder of the universe is not sampled. Prediction is used to compensate for the lack of data from the unsampled portion of the universe. The sample is assumed to be a subsample of an earlier sample where stratification is used on both occasions before sample selection. Accounting for births and deaths in the universe between the two points in time, the detailed sampling plan, estimator, standard error, and optimal sample allocation are presented with a focus on the second occasion. If prior auxiliary information is available, the methodology is also applicable to a first occasion. DOE

MISSILE LAUNCH DETECTION ELECTRIC FIELD PERTURBATION EXPERIMENT
R. J. Kane and T. M. Rynne 28 Apr. 1993 45 p
(Contract W-7405-eng-48)
(DE94-004224; UCRL-ID-114322) Avail: CASI HC A03/MF A01

The Lawrence Livermore National Laboratory and SARA Inc. participated in the ATMD missile launch activities that occurred at WSMR during January 1993. LLNL and SARA deployed sensors for monitoring of basic phenomena. An attempt was made to measure perturbations of the earth geo-potential during the launch of a Lance missile. The occurrence of the perturbation is expected from the conducting body of the missile and the exhaust plume. A set of voltage-probe antennas were used to monitor the local electric field perturbation from the launch at ranges of approximately 1 km. Examination of the data acquired during the launch period failed to show identifiable correlation of the field variations with the launch event. Three reasons are ascribed to this lack of event data: (1) The electric field potential variations have a limited spatial correlation length - the fields measured in one region have little correlation to measurements made at distances of a kilometer away. The potential variations are related to localized atmospheric disturbances and are generally unpredictable. A value for the spatial correlation length is also not known. (2) The conductivity of the plume and missile body are not adequate to produce a field perturbation of adequate magnitude. Phenomena related to the exhaust plume and missile may exist and be outside of the collection range of the equipment employed for these measurements. (3) The presence of 60 Hz power line noise was of sufficient magnitude to irreversibly contaminate measurements. DOE

SET GAMES
H. F. M. Aarts, Y. Funaki, and C. Hoede Jul. 1993 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-2960)
(MEMO-1148; ETN-94-95722) Avail: Issuing Activity (European Space Agency (ESA))

A type of cooperative games in characteristic function form (called set games) is introduced. In a set game, the worth of a coalition is expressed by a set instead of a real number. For this class of games, the notion of value is defined, being a solution concept and also several axioms. Values for set games that satisfy the so called additivity axiom which is the analog of the additivity axiom of the Shapley value are studied. ESA

PATH INTEGRAL FOR COHERENT STATES OF THE DYNAMICAL U(SUB 2) GROUP AND U(SUB 2/1) SUPERGROUP
E. A. Kochetov 1992 14 p
(DE94-606382; JINR-E-17-92-412) Avail: CASI HC A03/MF A01 (US Sales Only)

A part-integral formulation in the representation of coherent states for the unitary U(sub 2) group and U(sub 2/1) supergroup is introduced. U(sub 2) and U(sub 2/1) path integrals are shown to be defined on the coset spaces U(sub 2)/U(sub 1)xU(sub 1) and U(sub 2/1)/U(sub 1/1)xU(sub 1), respectively. These coset appears as curved classical phase spaces. Partition functions are expressed as path integrals over these spaces. In the case when U(sub 2) and U(sub 2/1) are the dynamical groups, the corresponding path integrals are evaluated with the help of linear fractional transformations that appear as the group (supergroup) action in the coset space (superspace). Possible applications for quantum models are discussed. DOE

The Complex Systems Summer School focuses on developing techniques for measuring and analyzing complex behavior, and applying these techniques to the study of a limited number of specific mathematical, physical, and living systems. The 1992 summer school consisted of approximately twelve short courses together with a number of seminars on selected topics, and took place over a period of four weeks. Topics covered include chaos, computational and algorithmic complexity, neural nets and computational neurobiology, parallel models in cognition, stochastic processes in physical and biological systems and pattern formation in biological systems. An important component of the schools is the publication

of the complete set of lecture notes in book form, the purpose of which is to provide students and researchers in the general scientific community with an overview of the emerging concepts of complex behavior, and their applications to specific systems. DTIC

Let C be a curve of genus g = or greater than 2, defined over a number field K, and let J be the Jacobian of C. Colemen, following Chabauty, has shown how to obtain good bounds on the cardinality of C(K) if the rank r of the Mordell-Weil group J(K) is less than g. The key to the method is to construct a logarithm on J(K sub v), for some valuation v of K, whose kernel contains J(K), and whose restriction to C(K sub v) is represented explicitly as the integral of a differential. This paper is an attempt to make the case, through a detailed examination of the case of Fermat curves, that this method can be fashioned into a quite precise tool for bounding rational points on curves. In particular, we will present an explicit description of the logarithm in question, given the existence of certain elements in a Selmer group attached to J. NTIS

TRACE FORMULAS AND DYNAMICAL ZETA FUNCTIONS IN THE NIELSEN THEORY
A. Felshtyn and R. Hill Dec. 1993 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-138195; IHES/M/93/67) Avail: Issuing Activity (National Technical Information Service (NTIS))

In this paper, we prove the trace formulas for the Reidemeister numbers of group endomorphisms in the following cases: the group is finitely generated and an endomorphism is eventually commutative; the group is finite; the group is a direct sum of a finite group and a finitely generated free abelian group; the group is finitely generated, nilpotent and torsion free. These results had previously been known only for the finitely generated free abelian group. As a consequence, we obtain under the same conditions on the fundamental group of a compact polyhedron, the trace formulas for the Reidemeister numbers of a continuous map and under suitable conditions the trace formulas for the Nielsen numbers of a continuous map. The trace formula for the Reidemeister numbers implies the rationality of the Reidemeister zeta function. We prove the rationality and functional equation for the Reidemeister zeta function of an endomorphism of a finitely generated torsion free nilpotent group and of a direct sum of a finite group and a finitely generated free abelian group. SIGNIFICANT FIGURES AND LYAPUNOV EXPONENTS IN CHAOS AND CONSTRAINED DIVERGENCE OF CHAOTIC ORBITS Ph.D. Thesis
Robert Hal Dalling 1992 190 p
Avail: Univ. Microfilms Order No. DA9313723

A numerical technique is developed which can determine the maximum Lyapunov exponent in n-dimensional systems. This exponent can be calculated from the rate at which the number of valid figures in a solution decreases. The advantages of this technique over existing methods are described. Chaos is shown to be independent of the number of significant figures used in measurements and in calculations. The existence of restricted error growth regions is shown. For orbits in these regions the magnitude of the exponentially growing error is less than the maximum difference in orbital values, that is, the chaotic orbit is constrained throughout time to a subset of the phase space covered by the orbit. These regions are anomalous in that the Lyapunov exponent is positive in the region, but the magnitude of the exponentially growing error is limited to a finite value. This means that long-term prediction can still be possible, within limits, at certain parameter values of a chaotic system. Dissert. Abstr.

FRACTAL APPROACH TO COMPUTER-ANALYTICAL MODELLING OF TREE CROWN
F. S. Berezovskaya, G. P. Karev, O. F. Kisliuk, R. G. Khlebopros, and Yu. L. Tcelniker Sep. 1993 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608089; IC-92/267) Avail: CASI HC A03 (US Sales Only)

In this paper we discuss three approaches to the modeling of a tree crown development. These approaches are experimental (i.e. regressive), theoretical (i.e. analytical) and simulation (i.e. computer) modeling. The common assumption of these is that a tree can be regarded as one of the fractal objects which is the collection of semi-similar objects and combines the properties of two- and three-dimensional bodies. We show that a fractal measure of crown can be used as the link between the mathematical models of crown growth and light propagation through canopy. The computer approach gives the possibility to visualize a crown development and to calibrate the model on experimental data. In the paper different stages of the above-mentioned approaches are described. The experimental data for spruce, the description of computer system for modeling and the variant of computer model are presented. DOE

IS IT POSSIBLE TO EXTEND THE DEFORMED WEYL ALGEBRA W(SUB q)(n) TO A HOPF ALGEBRA?
T. D. Palev Jul. 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608092; IC-93/163) Avail: CASI HC A02 (US Sales Only)

We argue that the algebra W(sub q)(n), generated by n pairs of deformed q-bosons, does not allow a Hopf algebra structure. To this end we show that it is impossible to define a comultiplication even for the usual,

nondeformed case. We indicate how the co-multiplication on U(sub q)(osp(1/2n)) can be used in order to construct representations of deformed (not necessarily Hopf) algebra in tensor products of Fock spaces. DOE

(DE94-004573; ANL/ET/CP-81277; CONF-931013-3) Avail: CASI HC A01/MF A01

Drag forces due to eddy currents induced by the relative motion of a conductor and a magnetic field occur in many practical devices: motors, brakes, magnetic bearings, and magnetically levitated vehicles. Recently, finite element codes have included solvers for three dimensional eddy current geometries and have the potential to be very useful in the design and analysis of these devices. In this paper, numerical results from three dimensional modeling of a magnet array spinning above a conductor are compared to experimental results in order to assess the capabilities of these codes. ESTIMATING THE COST OF LARGE SUPERCONDUCTING THIN SOLENOID MAGNETS
M. A. Green and S. J. St.Lorant Jul. 1993 6 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract DE-AC03-76SF-00098)
(DE94-006289; LBL-35002; CONF-930703-42) Avail: CASI HC A02/MF A01

The cost of thin superconducting solenoid magnets can be estimated if one knows the magnet stored energy, the magnetic field volume product or the overall mass of the superconducting coil and its cryostat. This report shows cost data collected since 1979 for large superconducting solenoid magnets used in high energy physics. These magnets are characterized in most cases by the use of indirect two phase helium cooling and a superconductor stabilizer of very pure aluminum. This correlation can be used for making a preliminary cost estimate of proposed one of a kind superconducting magnets. The magnet costs quoted include the power supply and quench protection system but the cost of the helium refrigerator and helium distribution system is not included in the estimated cost. DOE

SOME RESULTS ON THE PHASE DIAGRAM OF THE ANTIFERROMAGNETIC POTTS MODEL IN AN EXTERNAL MAGNETIC FIELD
A. Benyoussef (Mohammed V Univ., Rabat, Morocco.) and H. Ez-Zahraouy Sep. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608115; IC-93/299) Avail: CASI HC A03 (US Sales Only)

Phase diagram of the q state antiferromagnetic Potts model on a square lattice is investigated in a neighborhood of the critical point h = 4, T = 0. Using a constructive criterion of uniqueness introduced by Dobrushin, Kolafa, and Shlosman, for the antiferromagnetic Ising model, we show that the activity, a(sub c)(q) greater than 1/(q - 1) and the slope increases from zero (q = 2) to infinity (q = is proportional). The phase diagram bulges near the mentioned critical point for 2 less than q less than is proportional. DOE

LORAN-C TIME MANAGEMENT **c04**

Charles Justice, Norm Mason, and Doug Taggart *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 79-92 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

As of 1 Oct. 1993, the US Coast Guard (USCG) supports and operates fifteen Loran-C chains. With the introduction of the Global Positioning Systems (GPS) and the termination of the Department of Defense (DOD) overseas need for Loran-C, the USCG will cease operating the three remaining overseas chains by 31 Dec. 1994. Following this date, the USCG Loran-C system will consist of twelve chains. Since 1971, management of time synchronization of the Loran-C system has been conducted under a Memorandum of Agreement between the US Naval Observatory (USNO) and the USCG. The requirement to maintain synchronization with Coordinated Universal Time (UTC) was initially specified as +/- 25 microseconds. This tolerance was rapidly lowered to +/- 2.5 microseconds in 1974. To manage this synchronization requirement, the USCG incorporated administrative practices which kept the USNO appraised of all aspects of the master timing path. This included procedures for responding to timing path failures, timing adjustments, and time steps. Conducting these aspects of time synchronization depended on message traffic between the various master stations and the USNO. To determine clock adjustment the USCG relied upon the USNO's Series 4 and 100 updates so that the characteristics of the master clock could be plotted and controls appropriately applied. In 1987, Public Law 100-223, under the Airport and Airway Improvement Act Amendment, reduced the synchronization tolerance to approximately 100 nanoseconds for chains serving the National Airspace System (NAS). This action caused changes in the previous administrative procedures and techniques. The actions taken by the USCG to meet the requirements of this law are presented. Author (revised)

The work of the NATO Working Group on precise time and frequency (AC302/SG4/WG4), since its inception in 1988 to the end of 1993, is covered. The aim of the group was to produce STANAG 4430 detailing a standard interface for the transfer of precise time and frequency to assist the interoperability of NATO forces. The design of the interface is outlined together with the concepts leading to the design. The problem of providing and maintaining a traceable UTC in military user systems is described. TWO-WAY SATELLITE TIME TRANSFER: OVERVIEW AND RECENT DEVELOPMENTS

Gerrit deJong *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 101-118 (For primary document see N94-30639 08-70)

The experiment using small earth stations for transatlantic two-way satellite time transfer between the USA and Germany has had its 10th anniversary this year. Pseudo-random noise coded time signals were phase modulated and demodulated at each station using a modem. Recently, during the last two weeks of Aug. 1993, six European time laboratories have used the INTELSAT 307E satellite for line-up tests and preliminary time transfer sessions using the same type of MITREX modem. The need for a uniform format for the exchange of data was felt heavily after these sessions. This problem was foreseen and addressed in international working parties. During Apr. 1993, in Task Group 7/2 of the ITU Radiocommunication Sector, a very intense discussion has taken place about what procedure should be recommended for TWSTFT and what items the header and data lines of the resulting data fields should contain. A difficulty is that two different methods of calibration of the earth station delays exist which result in different sets of delay data to be exchanged. Further study and discussions are necessary. Also, a meeting of the CCDS Working Group on TWSTFT addressed this in Oct. 1993. The outcome of the discussions and the prospect for future developments are presented. Author (revised)

OPTICAL TECHNIQUES FOR TIME AND FREQUENCY TRANSFER **c74**

Francoise Baumont and Jean Gaignebet *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 119-132 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

Light has been used as a means for time synchronization for a long time. The flight time was supposed to be negligible. The first scientific determination of the velocity of the light was done by measuring a round trip flight time on a given distance. The well known flying clock experiment leading to Einstein's General Relativity is another example. The advent of lasers, particularly short pulse and modulated ones, as well as the improvements of the timing equipments have led to new concepts for time and frequency transfer. We describe some experiments using different techniques and configurations which have been proposed and tested in this field since the beginning of the space age. Added to that, we set out advantages, drawbacks, and performances achieved in the different cases. Author (revised)

GPS COMMON-VIEW TIME TRANSFER **c04**

W. Lewandowski *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 133-148 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

The introduction of the GPS common-view method at the beginning of the 1980's led to an immediate and dramatic improvement of international time comparisons. Since then, further progress brought the precision and accuracy of GPS common-view intercontinental time transfer from tens of nanoseconds to a few nanoseconds, even with SA activated. This achievement was made possible by the use of the following: ultra-precise ground antenna coordinates, post-processed precise ephemerides, double-frequency measurements of ionosphere, and appropriate international coordination and standardization. This paper reviews developments and applications of the GPS common-view method during the last decade and comments on possible future improvements whose objective is to attain sub-nanosecond uncertainty. This paper will examine aspects related to network synchronization distribution and the cascading of timing elements. Methods of timing distribution have become a much debated topic in standards forums and among network service providers (both domestically and internationally). Essentially these concerns focus on the need to migrate their existing network synchronization plans (and capabilities) to those required for the next generation of transport technologies (namely, the Synchronous Digital Hierarchy (SDH), Synchronous Optical Networks (SONET), and Asynchronous Transfer Mode (ATM). The particular choices for synchronization distribution network architectures are now being evaluated and are demonstrating that they can indeed have a profound effect on the overall service performance levels that will be delivered to the customer. The salient aspects of these concerns reduce to the following: (1) identifying that the devil is in the details of the timing element specifications and the distribution of timing information (i.e., small design choices can have a large performance impact); (2) developing a standardized method of performance verification that will yield unambiguous results; and (3) presentation of those results. Specifically, this will be done for two general cases: an ideal input, and a noisy input to a cascaded chain of slave clocks. Author (revised)

The Global Positioning System has allowed scientists and engineers to make measurements having accuracy far beyond the original 15 meter goal of the system. Using global networks of P-Code capable receivers and extensive post-processing, geodesists have achieved baseline precision of a few parts per billion, and clock offsets have been measured at the nanosecond level over intercontinental distances. A cloud hangs over this picture, however. The Department of Defense plans to encrypt the P-Code (called Anti-Spoofing, or AS) in the fall of 1993. After this event, geodetic and time measurements will have to be made using codeless GPS receivers. However, there appears to be a silver lining to the cloud. In response to the anticipated encryption of the P-Code, the geodetic and GPS receiver community has developed some remarkably effective means of coping with AS without classified information. We will discuss various codeless techniques currently available and the data noise resulting from each. We will review some geodetic results obtained using only codeless data, and discuss the implications for time measurements. Finally, we will present the status of GPS research at JPL in relation to codeless clock measurements. Author (revised)

THE USE OF THE AOA TTR-4P GPS RECEIVER IN OPERATION AT THE BIPM FOR REAL-TIME RESTITUTION OF GPS TIME c04
Claudine Thomas *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 183-196 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

The Global Positioning System is an outstanding tool for the dissemination of time. Using mono-channel C/A-code GPS time receivers, the restitution of GPS time through the satellite constellation presents a peak-to-peak discrepancy of several tens of nanoseconds without SA but may be as high as several hundreds of nanoseconds with SA. As a consequence, civil users are more and more interested in implementing hardware and software methods for efficient restitution of GPS time, especially in the framework of the project of a real-time prediction of UTC (UTCp) which could be available in the form of time differences (UTCp - GPS time). Previous work, for improving the real-time restitution of GPS time with SA, to the level obtained without SA, focused on the implementation of a Kalman filter based on past data and updated at each new observation. An alternative solution relies upon the statistical features of the noise brought about by SA; it has already been shown that the SA noise is efficiently reduced by averaging data from numerous satellites observed simultaneously over a sufficiently long time. This method was successfully applied to data from a GPS time receiver, model AOA TTR-4P, connected to the cesium clock kept at the BIPM. This device, a multi-channel, dual frequency, P-code GPS time receiver, is one of the first TTR-4P units in operation in a civil laboratory. Preliminary comparative studies of this new equipment with conventional GPS time receivers are described in this paper. The results of an experimental restitution of GPS time, obtained in June 1993, are also detailed: 3 to 6 satellites were observed simultaneously with a sample interval of 15 s, an efficient smoothing of SA noise was realized by averaging data on all observed satellites over more than 1 hour. When the GPS system is complete in 1994, 8 satellites will be observable continuously from anywhere in the world and the same level of uncertainty will be obtained using a shorter averaging time.

DEVELOPMENT OF AN ACCURATE TRANSMISSION LINE FAULT LOCATOR USING THE GLOBAL POSITIONING SYSTEM SATELLITES c04
Harry Lee *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 197-204 (For primary document see N94-30639 08-70)
Avail: CASI HC A02/MF A06

A highly accurate transmission line fault locator based on the traveling-wave principle was developed and successfully operated within B.C. Hydro. A transmission line fault produces a fast-risetime traveling wave at the fault point which propagates along the transmission line. This fault locator system consists of traveling wave detectors located at key substations which detect and time tag the leading edge of the fault-generated traveling wave as if passes through. A master station gathers the time-tagged information from the remote detectors and determines the location of the fault. Precise time is a key element to the success of this system. This fault locator system derives its timing from the Global Positioning System (GPS) satellites. System tests confirmed the accuracy of locating faults to within the design objective of +/-300 meters. Author (revised)

RELATIVISTIC THEORY FOR PICOSECOND TIME TRANSFER IN THE VICINITY OF EARTH
G. Petit and P. Wolf *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 205-216 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

The problem of light propagation is treated in a geocentric reference system with the goal of ensuring picosecond accuracy for time transfer techniques using electromagnetic signals in the vicinity of the Earth. We give an explicit formula for a one way time transfer, to be applied when the spatial coordinates of the time transfer stations are known in a geocentric reference system rotating with the Earth. This expression is extended, at the same accuracy level of one picosecond, to the special cases of two way and LASSO time transfers via geostationary satellites.

A REAL-TIME PREDICTION OF UTC
Claudine Thomas and David W. Allan *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 217-230 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

The reference time scale for all scientific and technologic applications on the Earth, the Universal Coordinated Time (UTC), must be as stable, reliable, and accurate as possible. With this in view the BIPM and before it the BIH, have always calculated and then disseminated UTC with a delay of about 80 days. There are three fundamental reasons for doing this: (1) It takes some weeks for data, gathered from some 200 clocks

spread world-wide, to be collected and for errors to be eliminated; (2) changes in clock rates can only be measured with high precision well after the fact; and (3) the measurement noise originating in time links, in particular using Loran-C, is smoothed out only when averaging over an extended period. Until mid-1992, the ultimate stability of UTC was reached at averaging times of about 100 days and corresponded to an Allan deviation sigma(sub y)(tau) of about 1,5x10(exp -14) then compared to the best primary clock in the world, the PTB CS2. For several years now, a predicted UTC has been computed by the USNO through an extrapolation of the values as published in deferred time by the BIPM. This is made available through the USNO Series 4, through the USNO Automated Data Service, and through GPS signals. Due to the instability of UTC, the poor predictability of the available clocks, and the intentional SA degradation of GPS signals, the real-time access to this extrapolated UTC has represented the true deferred-time UTC only to within several hundreds of nanoseconds.

Time scales have been constructed in different ways to meet the many demands placed upon them for time accuracy, frequency accuracy, long-term stability, and robustness. Usually, no single time scale is optimum for all purposes. In the context of the impending availability of high-accuracy intermittently-operated cesium fountains, we reconsider the question of evaluating the accuracy of time scales which use an algorithm to span interruptions of the primary standard. We consider a broad class of calibration algorithms that can be evaluated and compared quantitatively for their accuracy in the presence of frequency drift and a full noise model (a mixture of white PM, flicker PM, white FM, flicker FM, and random walk FM noise). We present the analytic techniques for computing the standard uncertainty for the full noise model and this class of calibration algorithms. The simplest algorithm is evaluated to find the average-frequency uncertainty arising from the noise of the cesium fountain's local oscillator and from the noise of a hydrogen maser transfer-standard. This algorithm and known noise sources are shown to permit interlaboratory frequency transfer with a standard uncertainty of less than 10(exp -15) for periods of 30-100 days.

TIME TRANSFER USING GEOSTATIONARY SATELLITES: IMPLEMENTATION OF A KALMAN FILTER

F. Meyer *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 267-276 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

Since 1988, various experiments have shown that the TV signals transmitted by direct TV satellites may easily be used to perform time transfers at the level of a few tens of nanoseconds, the main source of error being the uncertainty on the satellite position. We first present the two methods used in our experiment to reduce the effects of the satellite residual motion: the first one consists in estimating the longitude variations of the satellite and then using this information to improve other measurements. This allows reducing the uncertainty to values between 9 and 50 nanoseconds according to the position of the involved stations. In the second method we determine the satellite position by using the data collected by three calibrated stations. Time transfer between each of these stations and a fourth one has been shown to be achievable at the precision level of ten nanoseconds. A new approach based on the use of a Kalman filter is proposed in order to take into account the dynamics of the geostationary satellite. The precisions on orbital elements and clock differences and rates determination given by the first simulated applications of the Kalman filter are presented and compared to those obtained by the other methods.

THE TWO-WAY TIME SYNCHRONIZATION SYSTEM VIA A SATELLITE VOICE CHANNEL

Zheng Heng-Qiu, Zhang Ren-Huan, and Hu Yong-Hui *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 277-284 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

A newly developed two-way time synchronization system is described in this paper. The system uses one voice channel at a SCPC satellite digital communication earth station, whose bandwidth is only 45 kHz, thus saving satellite resources greatly. The system is composed of one master station and one or several, up to sixty-two, secondary stations. The master and secondary stations are equipped with the same equipment, including a set of timing equipment, a synthetic data terminal for time synchronizing, and a interface unit between the data terminal and the satellite earth station. The synthetic data terminal for time synchronization also has an IRIG-B code generator and a translator. The data terminal of master station is the key part of whole system. The system synchronization process is full automatic, which is controlled by the master station. Employing an autoscanning technique and conversational mode, the system accomplishes the following tasks: linking up liaison with each secondary station in turn, establishing a coarse time synchronization, calibrating date (years, months, days) and time of day (hours, minutes, seconds), precisely measuring the time difference between local station and the opposite station, exchanging measurement data, statistically processing the data, rejecting error terms, printing the data, calculating the clock difference and correcting the phase, thus realizing real-time synchronization from one point to multiple points. We also designed an adaptive phase circuit to eliminate the phase ambiguity of the PSK demodulator. The experiments have shown that the time synchronization accuracy is better than 2 mu S. The system has been put into regular operation.

A COMPARISON OF GPS BROADCAST AND DMA PRECISE EPHEMERIDES **c04**

Marc A. Weiss, Gerard Petit, and Steve Shattil *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 293-306 (For primary document see N94-30639 08-70)

Avail: CASI HC A03/MF A06

We compare the broadcast ephemerides from Global Positioning Satellites (GPS) to the postprocessed ephemerides from the Defense Mapping Agency (DMA). We find significant energy in the spectrum of the residuals at 1 cycle/day and higher multiples. We estimate the time variance of the residuals and show that the short term residuals, from 15 min, exhibit power law processes with greater low frequency perturbations than white phase modulation. We discuss the significance of these results for the performance of the GPS Kalman filter which estimates the broadcast orbits. Author

SOME APPLICATIONS OF GPS TIMING INFORMATION **c04**

Yinbai Zhang *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 307-315 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

GPS Satellites transmit two independent signals. One is C/A code (course acquisition signal) which could be utilized by all civilian users. This service is called a Standard Positioning Service (SPS). Another is P code (precise signal) that could be only accessed by those authorized users. The service is called a precise positioning service (PPS). SPS C/A code users can navigate with accuracy of approximately 100 m and timing accuracy of about 250-300 ns (1 sigma). Such timing accuracy is not enough for precision time and frequency value transfer. For this reason we must do some research work to improve the SPS C/A code accuracy which SPS users can get. This paper presents our recent progress on timing information analysis, its data processing and its timing and frequency measurement applications. Derived from text

HYDROGEN MASERS AND CESIUM FOUNTAINS AT NRC **c36**

J.-S. Boulanger, D. Morris, R. J. Douglas, and M.-C. Gagne *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 345-356 (For primary document see N94-30639 08-70)

Avail: CASI HC A03/MF A06

The NRC masers H-3 and H-4 have been operating since June 1993 with cavity servo control. These low-flux active H masers are showing stabilities of about 10(exp -15) from 1 hour to several days. Stability results are presented, and the current and planned uses of the masers are discussed. A cesium fountain primary frequency standard project has been started at NRC. Trapping and launching experiments with the goal of 7 m/s launches are beginning. We discuss our plans for a local oscillator and servo that exploit the pulsed aspect of cesium fountain standards, and meet the challenge of 10(exp -14) tau(exp -1/2) stability without requiring masers. At best, we expect to run this frequency standard initially for periods of hours each working day rather than continuously for years, and so frequency transfer to outside laboratories has been carefully considered. We conclude that masers (or other even better secondary clocks) are required to exploit this potential accuracy of the cesium fountain. We present and discuss our conclusion that it is feasible to transfer frequency in this way with a transfer-induced uncertainty of less than 10(exp -15), even in the presence of maser frequency drift and random walk noise. NOISE AND DRIFT ANALYSIS OF NON-EQUALLY SPACED TIMING DATA

F. Vernotte, G. Zalamansky, and E. Lantz *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 379-388 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

Generally, it is possible to obtain equally spaced timing data from oscillators. The measurement of the drifts and noises affecting oscillators is then performed by using a variance (Allan variance, modified Allan variance, or time variance) or a system of several variances (multivariance method). However, in some cases, several samples, or even several sets of samples, are missing. In the case of millisecond pulsar timing data, for instance, observations are quite irregularly spaced in time. Nevertheless, since some observations are very close together (one minute) and since the timing data sequence is very long (more than ten years), information on both short-term and long-term stability is available. Unfortunately, a direct variance analysis is not possible without interpolating missing data. Different interpolation algorithms (linear interpolation, cubic spline) are used

to calculate variances in order to verify that they neither lose information nor add erroneous information. A comparison of the results of the different algorithms is given. Finally, the multivariance method was adapted to the measurement sequence of the millisecond pulsar timing data: the responses of each variance of the system are calculated for each type of noise and drift, with the same missing samples as in the pulsar timing sequence. An estimation of precision, dynamics, and separability of this method is given.

AN ALGORITHM FOR THE ITALIAN ATOMIC TIME SCALE
F. Cordara, G. Vizio, P. Tavella, and V. Pettiti *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 389-400 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

During the past twenty years, the time scale at the IEN has been realized by a commercial cesium clock, selected from an ensemble of five, whose rate has been continuously steered towards UTC to maintain a long term agreement within 3 x 10(exp -13). A time scale algorithm, suitable for a small clock ensemble and capable of improving the medium and long term stability of the IEN time scale, has been recently designed taking care of reducing the effects of the seasonal variations and the sudden frequency anomalies of the single cesium clocks. The new time scale, TA(IEN), is obtained as a weighted average of the clock ensemble computed once a day from the time comparisons between the local reference UTC(IEN) and the single clocks. It is foreseen to include in the computation also ten cesium clocks maintained in other Italian laboratories to further improve its reliability and its long term stability. To implement this algorithm, a personal computer program in Quick Basic has been prepared and it has been tested at the IEN time and frequency laboratory. Results obtained using this algorithm on the real clocks data relative to a period of about two years are presented. Author (revised)

A COMPARATIVE STUDY OF CLOCK RATE AND DRIFT ESTIMATION
Lee A. Breakiron *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 401-412 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

Five different methods of drift determination and four different methods of rate determination were compared using months of hourly phase and frequency data from a sample of cesium clocks and active hydrogen masers. Linear least squares on frequency is selected as the optimal method of determining both drift and rate, more on the basis of parameter parsimony and confidence measures than on random and systematic errors. PROVIDING HYDROGEN MASER TIMING STABILITY TO ORBITING VLBI RADIO TELESCOPE OBSERVATIONS BY POST-MEASUREMENT COMPENSATION OF LINKED FREQUENCY STANDARD IMPERFECTIONS **c36**
James C. Springett *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 413-424 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

Orbiting VLBI (OVLBI) astronomical observations are based upon measurements acquired simultaneously from ground-based and earth-orbiting radio telescopes. By the mid-1990s, two orbiting VLBI observatories, Russia's Radioastron and Japan's VSOP, will augment the worldwide VLBI network, providing baselines to earth radio telescopes as large as 80,000 km. The challenge for OVLBI is to effectuate space to ground radio telescope data cross-correlation (the observation) to a level of integrity currently achieved between ground radio telescopes. VLBI radio telescopes require ultrastable frequency and timing references in order that long term observations may be made without serious cross-correlation loss due to frequency source drift and phase noise. For this reason, such instruments make use of hydrogen maser frequency standards. Unfortunately, space-qualified hydrogen maser oscillators are currently not available for use on OVLBI satellites. Thus, the necessary long-term stability needed by the orbiting radio telescope may only be obtained by microwave uplinking a ground-based hydrogen maser derived frequency to the satellite. Although the idea of uplinking the frequency standard intrinsically seems simple, there are many 'contaminations' which degrade both the long and short term stability of the transmitted reference. Factors which corrupt frequency and timing accuracy include additive radio and electronic circuit thermal noise, slow or systematic phase migration due to changes of electronic circuit temporal operating conditions (especially temperature), ionosphere and troposphere induced scintillations, residual Doppler-incited components, and microwave signal multipath propagation. What is important, though, is to realize that ultimate stability does not have to be achieved in real-time. Instead, information needed to produce a high degree of coherence in the subsequent cross-correlation operation may be derived from a two-way coherent radio link, recorded and later introduced as compensations adjunct to the VLBI correlation process. Accordingly, this paper examines the technique for stable frequency/time transfer within the OVLBI system, together with a critique of the types of link degradation components which must be compensated, and the figures of merit known as coherence factors.

PRECISION FREQUENCY SYNTHESIZING SOURCES WITH EXCELLENT TIME/FREQUENCY PERFORMANCES
Liren Zhou and Hai Lin *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 425-432 (For primary document see N94-30639 08-70)
Avail: CASI HC A02/MF A06

Precision frequency synthesizing sources are needed in the time / frequency measuring system, atomic frequency standards, telemetry, communication, and radar systems. This kind of frequency synthesizing source possesses high frequency accuracy and excellent long term and short term frequency stability. Several precision frequency synthesizing sources developed by Beijing Institute of Radio Metrology and Measurement (BIRMM) which have been successfully applied to the time / frequency measuring system, atomic frequency standards system, and radar system are described. In addition, the working principle, implementation approach, and the main technical specifications of the frequency synthesizing sources are also given. Author (revised)

TIME MAINTENANCE SYSTEM FOR THE BMDO MSX SPACECRAFT **c18**
Martin J. Hermes *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 433-444 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

The Johns Hopkins University Applied Physics Laboratory (APL) is responsible for designing and implementing a clock maintenance system for the Ballistic Missile Defense Organizations (BMDO) Midcourse Space Experiment (MSX) spacecraft. The MSX spacecraft has an on-board clock that will be used to control execution of time-dependent commands and to time tag all science and housekeeping data received from the spacecraft. MSX mission objectives have dictated that this spacecraft time, UTC(MSX), maintain a required accuracy with respect to UTC(USNO) of +/- 10 ms with a +/- 1 ms desired accuracy. APL's atomic time standards and the downlinked spacecraft time were used to develop a time maintenance system that will estimate the current MSX clock time offset during an APL pass and make estimates of the clock's drift and aging using the offset estimates from many passes. Using this information, the clock's accuracy will be maintained by uplinking periodic clock correction commands. The resulting time maintenance system is a combination of offset measurement, command/telemetry, and mission planning hardware and computing assets. All assets provide necessary inputs for deciding when corrections to the MSX spacecraft clock must be made to maintain its required accuracy without inhibiting other mission objectives. The MSX time maintenance system is described as a whole and the clock offset measurement subsystem, a unique combination of precision time maintenance and

measurement hardware controlled by a Macintosh computer, is detailed. Simulations show that the system estimates the MSX clock offset to less than +/- 33 microseconds. Author (revised)

MEASUREMENT OF THE FREQUENCY STABILITY OF RESPONDERS IN AIRCRAFT **c32**
Xiaofan Liu *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 445-456 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

Measurement on an aircraft orbit, such as a satellite launching orbit, is made by the responder in the aircraft along with several remote track stations on the ground. During the launching, the system is required to have precise time synchronization and frequency accuracy. At the same time, accurate measurement of aircraft velocity requires high frequency stability of the system. However, atomic frequency standards in the ground stations supply time and frequency reference standard with excellent long term and short term frequency stability for the above-mentioned goals. The stability of responder is also an important factor affecting the performance of the system and there are more requirements for the corresponding time/frequency measurements. In the system, the responders do not use continuous wave (CW) but narrow pulse modulated wave; consequently, the characterization theory of their stability is more complicated and the measurement technique is more difficult for pulsed wave than that for CW. A systematic characterization theory of the frequency stability for pulsed wave is demonstrated and the measuring methods are discussed. The measurement systems, which have been set up in Beijing Institute of Radio Metrology and Measurement (BIRMM) and can be used to test the frequency stability of pulse coherent responders in time domain and frequency domain with high sensitivity and accuracy, are described. Using these measurement systems, successful measurements for the responders were made with which the satellite launching orbits were precisely obtained and tracked. Author (revised)

GROUND CONTROL SYSTEM FOR THE MIDCOURSE SPACE EXPERIMENT UTC CLOCK
Richard Dragonette *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 457-462 (For primary document see N94-30639 08-70)
Avail: CASI HC A02/MF A06

One goal of the Midcourse Space Experiment (MSX) spacecraft Operations Planning Center is to maintain the onboard satellite UTC clock (UTC(MSX)) to within 1 millisecond of UTC(APL) (the program requirement is 10 msec). The UTC(MSX) clock employs as its time base an APL built 5 MHz quartz oscillator, which is expected to have frequency instabilities (aging rate + drift rate + frequency offset) that will cause the clock to drift approximately two to ten milliseconds per day. The UTC(MSX) clock can be advanced or retarded by the APL MSX satellite ground control center by integer multiples of 1 millisecond. The MSX Operations Planning Center is developing software which records the drift of UTC(MSX) relative to UTC(APL) and which schedules the time of day and magnitude of UTC(MSX) clock updates up to 48 hours in advance. Because of the manner in which MSX spacecraft activities are scheduled, MSX clock updates are planned 24 to 48 hours in advance, and stored in the satellite's computer controller for later execution. Data will be collected on the drift of UTC(MSX) relative to UTC(APL) over a three to five day period. Approximately six times per day, the time offset between UTC(MSX) and UTC(APL) will be measured by APL with a resolution of less than 100 microseconds. From this data a second order analytical model of the clock's drift will be derived. This model will be used to extrapolate the offset of the MSX clock in time from the present to 48 hours in the future. MSX clock updates will be placed on the spacecraft's daily schedule whenever the predicted clock offset exceeds 0.5 milliseconds. The paper includes a discussion of how the empirical model of the MSX clock is derived from satellite telemetry data, as well as the algorithm used to schedule MSX clock updates based on the model. TIME SYNCHRONIZED VIDEO SYSTEMS **c32**
Ron Burnett *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 463-466 (For primary document see N94-30639 08-70)
Avail: CASI HC A01/MF A06

The idea of synchronizing multiple video recordings to some type of 'range' time has been tried to varying degrees of success in the past. Combining this requirement with existing time code standards (SMPTE) and the new innovations in desktop multimedia however, have afforded an opportunity to increase the flexibility and usefulness of such efforts without adding costs over the traditional data recording and reduction systems. The concept described can use IRIG, GPS or a battery backed internal clock as the master time source. By converting that time source to Vertical Interval Time Code or Longitudinal Time Code, both in accordance with the SMPTE standards, the user will obtain a tape that contains machine/computer readable time code suitable for use with editing equipment that is available off-the-shelf. Accuracy on playback is then determined by the playback system chosen by the user. Accuracies of +/- 2 frames are common among inexpensive systems and complete frame accuracy is more a matter of the users' budget than the capability of the recording system. Author

HYDROGEN MASER CLOCKS IN SPACE FOR SOLID-EARTH RESEARCH AND TIME-TRANSFER APPLICATIONS: EXPERIMENT OVERVIEW AND EVALUATION OF RUSSIAN MINIATURE SAPPHIRE LOADED CAVITY
G. Busca, L. G. Bernier, P. Silvestrin, S. Feltham, B. A. Gaygerov, and V. M. Tatarenkov *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 467-480 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

The Observatoire Cantonal de Neuchatel (ON) is developing for ESTEC a compact H-maser for space use based upon a miniature sapphire loaded microwave cavity, a technique pioneered at VNIIFTRI. Various contacts between West-European parties, headed by ESA, and the Russian parties, headed by ESA, led to the proposal for flying two H-masers on Meteor 3M, a Russian meteorology satellite in low polar orbit. The experiment will include two masers, one provided by ON and the other by VNIIFTRI. T/F transfer and precise positioning will be performed by both a microwave link, using PRARE equipment, and an optical link, using LASSO-like equipment. The main objectives of the experiment are precise orbit determination and point positioning for geodetic/geophysical research, ultra-accurate time comparison and dissemination as well as in-orbit demonstration of operation and performance of H-masers. Within the scope of a preliminary space H-maser development phase performed for ESTEC at ON in preparation to the joint experiment, a Russian miniature sapphire loaded microwave cavity, on loan from VNIIFTRI, was evaluated in a full-size EFOS hydrogen maser built by ON. The experimental evaluation confirmed the theoretical expectation that with a hydrogen storage volume of only 0.65 liter an atomic quality factor of 1.5 x 10(exp 9) can be obtained for a -105 dBm output power. This represents a theoretical Allan deviation of 1.7 x 10(exp -15) averaged on a 1000 s time interval. From a full-size design to a compact one, therefore, the sacrifice in performance due to the reduction of the storage volume is very small. Author

IONOSPHERIC CORRECTIONS TO PRECISE TIME TRANSFER USING GPS **c04**
Robert W. Snow, Allen W. Osborne, III, John A. Klobuchar, and Patricia H. Doherty *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 495-504 (For primary document see N94-30639 08-70)
Avail: CASI HC A02/MF A06

The free electrons in the earth's ionosphere can retard the time of reception of GPS signals received at a ground station, compared to their time in free space, by many tens of nanoseconds, thus limiting the accuracy of time transfer by GPS. The amount of the ionospheric time delay is proportional to the total number of electrons encountered by the wave on its path from each GPS satellite to a receiver. This integrated number of electrons is called Total Electron Content, or TEC. Dual frequency GPS

receivers designed by Allen Osborne Associates, Inc. (AOA) directly measure both the ionospheric differential group delay and the differential carrier phase advance for the two GPS frequencies and derive from this the TEC between the receiver and each GPS satellite in track. The group delay information is mainly used to provide an absolute calibration to the relative differential carrier phase, which is an extremely precise measure of relative TEC. The AOA Mini-Rogue ICS-4Z and the AOA TurboRogue ICS-4000Z receivers normally operate using the GPS P code, when available, and switch to cross-correlation signal processing when the GPS satellites are in the Anti-Spoofing (A-S) mode and the P code is encrypted. An AOA ICS-Z receiver has been operated continuously for over a year at Hanscom AFB, MA to determine the statistics of the variability of the TEC parameter using signals from up to four different directions simultaneously. The 4-channel ICS-4Z and the 8-channel ICS-4000Z, have proven capabilities to make precise, well calibrated, measurements of the ionosphere in several directions simultaneously. In addition to providing ionospheric corrections for precise time transfer via satellite, this dual frequency design allows full code and automatic codeless operation of both the differential group delay and differential carrier phase for numerous ionospheric experiments being conducted. Statistical results of the data collected from the ICS-4Z during the initial year of ionospheric time delay in the northeastern U.S., and initial results with the ICS-4000Z, will be presented. THE NIST INTERNET TIME SERVICE

Judah Levine *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 505-514 Prepared in cooperation with National Inst. of Standards and Technology, and Colorado Univ. (For primary document see N94-30639 08-70)

(Grant NSF NCR-91-15055)

Avail: CASI HC A02/MF A06

We will describe the NIST Network Time Service which provides time and frequency information over the Internet. Our first time server is located in Boulder, Colorado, a second backup server is under construction there, and we plan to install a third server on the East Coast later this year. The servers are synchronized to UTC(NIST) with an uncertainty of about 0.8 ms RMS and they will respond to time requests from any client on the Internet in several different formats including the DAYTIME, TIME and NTP protocols. The DAYTIME and TIME protocols are the easiest to use and are suitable for providing time to PC's and other small computers. In addition to UTC(NIST), the DAYTIME message provides advance notice of leap seconds and of the transitions to and from Daylight Saving Time. The Daylight Saving Time notice is based on the US transition dates of the first Sunday in April and the last one in October. The NTP is a more complex protocol that is suitable for larger machines; it is normally run as a 'daemon' process in the background and can keep the time of the client to within a few milliseconds of UTC(NIST). We will describe the operating principles of various kinds of client software ranging from a simple program that queries the server once and sets the local clock to more complex 'daemon' processes (such as NTP) that continuously correct the time of the local clock based on periodic calibrations. RUSSIAN NATIONAL TIME SCALE LONG-TERM STABILITY

A. P. Alshina, B. A. Gaigerov, N. B. Koshelyaevsky, and S. B. Pushkin *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 523-532 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

The Institute of Metrology for Time and Space NPO 'VNIIFTRI' generates the National Time Scale (NTS) of Russia -- one of the most stable time scales in the world. Its striking feature is that it is based on a free ensemble of H-masers only. During last two years the estimations of NTS longterm stability based only on H-maser intercomparison data gives a flicker floor of about (2 to 3) x 10(exp -15) for averaging times from 1 day to 1 month. Perhaps the most significant feature for a time laboratory is an extremely low possible frequency drift -- it is too difficult to estimate it reliably. The other estimations, free from possible inside the ensemble correlation phenomena, are available based on the time comparison of NTS relative to the stable enough time scale of outer laboratories. The data on NTS comparison relative to the time scale of secondary time and frequency standards at Golitzino and Irkutsk in Russia and relative to NIST, PTB and USNO using GLONASS and GPS time transfer links gives stability estimations which are close to that based on H-maser intercomparisons. USING GLONASS SIGNAL FOR CLOCK SYNCHRONIZATION

Yuri G. Gouzhva, Arvid G. Gevorkyan, Pyotr P. Bogdanov, and Vitaly V. Ovchinnikov *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 533-540 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

Although in accuracy parameters GLONASS is correlated with GPS, using GLONASS signals for high-precision clock synchronization was, up to the recent time, of limited utility due to the lack of specialized time receivers. In order to improve this situation, in late 1992 the Russian Institute of Radionavigation and Time (RMT) began to develop a GLONASS time receiver using as a basis the airborne ASN-16 receiver. This paper presents results of estimating user clock synchronization accuracy via GLONASS signals using ASN-16 receiver in the direct synchronization and common-view modes. Author

A LOOK INTO THE CRYSTAL BALL: THE NEXT 25 YEARS

Helmut Hellwig *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 541-548 (For primary document see N94-30639 08-70)

Avail: CASI HC A02/MF A06

The PTTI Planning Meeting was born at about the same time as the atomic definition of the unit of time, the second. This use of the cesium resonance was made possible by advances in quantum electronics during the preceding decade which resulted in commercial availability of cesium, rubidium, and hydrogen clocks and frequency standards. Twenty-five years later these types of clocks still are the backbone of time and frequency applications; together with a variety of crystal oscillators, transmitters, and receivers, as well as signal distribution, conditioning and switching systems, atomic clocks are an essential part of the infrastructure of modern navigation and communication technology. The next 25 years undoubtedly will see a pervasive expansion of PTTI into the infrastructure that supports and leverages industrial, social, environmental, defense, and even individual human activities. Speculation as to what capabilities, services, and personal conveniences may become available will be limited by two factors: the degree to which existing device concepts can be made more affordable and reliable, and the ability to miniaturize for purposes of compatibility with electronic integration. With regard to the latter, history teaches us that the required technological breakthrough is unlikely to originate in existing technology; thus, we may expect a paradigm shift in PTTI device concepts not unlike the shift in the 1960s from vacuum tubes to semiconductors. Meeting May 1994 p 561-572 (For primary document see N94-30639 08-70)
Avail: CASI HC A03/MF A06

Present and possible future performance for many of the existing and new commercial frequency standards is presented here. Recent progress in the gas cell atomic standards with regards to size and cost is significant and considerable improvement is expected. Cesium beam standards will benefit in stability and accuracy from optical pumping. Cooled hydrogen masers will offer extremely good stability. Advances in trapped ion and cesium fountain technologies make them good high performance candidates for the future. The quartz oscillator field is more mature and consequently performance improvements for the future are going to be less spectacular. Oscillators stabilized to GPS will have many applications. Recent performance of cooled microwave dielectric resonator oscillators is very good and they offer the promise of serving as flywheel oscillators for advanced performance atomic standards. Author

THE FUTURE OF TIME AND FREQUENCY DISSEMINATION
Judah Levine *In* NASA. Goddard Space Flight Center, The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting May 1994 p 573-578 (For primary document see N94-30639 08-70)

I will try to extrapolate the changes in the dissemination of time and frequency information that have taken place during the last 25 years to predict the future developments both in the methods of disseminating time and frequency and in the kinds of customers we will be asked to serve. Two important developments are likely to play pivotal roles in driving the evolution of dissemination. The first is the commercial availability of very high quality clocks -- devices whose performance may eventually rival that of the current generation of primary frequency standards. The widespread use of these devices may blur the traditional distinction between client and server, and may replace it with a more symmetrical interchange of data among peers. The second is the increasing demand for digital time and frequency information driven by the increasing sophistication of everything from traffic lights to electric power meters. The needs of these individual users may not tax the state of the art of primary frequency standards in principle, but their large numbers and wide geographical distribution present a technological challenge that is difficult to meet at a reasonable price using existing methods. Some of these problems may be solved (or at least addressed) using developments in communications and consumer electronics such as the increasing use of fiber-optic telephone circuits and the increasing bandwidth and sophistication of the cable network used to transmit television pictures. To be useful, these advances in hardware must stimulate parallel advances in software algorithms and methods. These advances are more difficult to predict with great confidence, but the developments of the last few years will be examined to provide some indications of the future. Author

(National Physical Lab. Teddington, Middlesex TW11 0LW, England)

Guidelines prepared to assist users of low permeability measuring equipment who wish to calibrate their instruments using certain reference materials are presented. There are three main types of commercial instruments which could be calibrated using the considered reference materials. There is the magnetic balance type, which compares the attraction of a magnet to a series of reference inserts and its attraction to the specimen under test. This instrument indicates the range of permeability in which the test sample lies. The two other types of instruments, which give a continuous scale reading, utilize a permanent magnet and either strain gauge or fluxgate elements to measure the effect of test materials in contact with their probes. The last two types usually have a number of ranges and their linearity over these ranges is not good. The instruments, therefore, need to be calibrated using a material of permeability close in value to that under test. The magnetic field strength at the tip of the probe of each type of instrument was found to be significantly different. The magnetic field strength at the tip of a particular probe can be conveniently measured using a Hall effect probe and Gaussmeter. ESA

(National Physical Lab., Teddington, Middlesex TW11 0LW, England)

Progress on the application of coaxial reflectometric sensors to the measurement of Radio Frequency (RF) and microwave dielectric properties of laminated materials is described. Measurements were performed in the range 300 MHz to 3 GHz, but the findings can be applied over the whole of the RF and microwave range. As a result of the work described, both high and low loss materials can be measured by coaxial sensors. Suitable specimens of one, two, and three dielectric layers can be characterized. A cell attachment was constructed for a 14 mm diameter sensor which allows circular specimens to be measured more accurately. The cell also allows liquid immersion measurements to be performed, which affords greatly improved uncertainties. Three independent computer programs were written to analyze multilayer laminar specimens. The programs were intercompared and were shown to agree numerically to well within expected measurement uncertainties. Measurements upon liquid and solid materials of known permittivity were compared with the program predictions and shown to agree sufficiently well to allow the system to be used for traceable measurements within the national measurement system. A study to select suitable reference materials for the calibration of magnetic permeability measuring instruments over their normal working range of relative magnetic permeability of 1.0025 to 1.4 was performed. With the exception of some of the rare Earth elements, the permeability of the elements is below the lower limit of this range. It was necessary, therefore, to investigate metallic alloys and composites. As a result, three magnetic alloys were selected on grounds of their stability and uniformity of composition: 1.0025 to 1.007 stainless steel type American Iron and Steel Institute (AISI) 316; 1.03 to 1.07 high tensile brass; and 1.2 to 1.4 aluminum nickel bronze. STUDIES OF INTERFACES AND VAPORS WITH OPTICAL SECOND HARMONIC GENERATION Ph.D. Thesis
C. S. Mullin (California Univ., Berkeley.) Dec. 1993 131 p
(Contract DE-AC03-76SF-00098)
(DE94-006295; LBL-35028) Avail: CASI HC A07/MF A02

Optical Second Harmonic Generation (SHG) has been applied to the study of soap-like molecules adsorbed to the water-air interface. By calibrating the signal from a soluble monolayer with that of an insoluble homolog, absolute measurements of the surface density could be obtained and related to the bulk concentration and surface tension. We could then demonstrate that the soluble surfactant forms a single monolayer at the interface. Furthermore, it deviates significantly from the ideal case in that its activity coefficients are far from 1, yet those coefficients remain constant over a broad range of surface pressures. We present evidence of a first-order phase transition taking place during the adsorption of this soluble monolayer. We consider the effects of the non-ideal behavior and the phase transition on the microscopic model of adsorption, and formulate an alternative to the Langmuir picture of adsorption which is just as simple, yet it can more easily allow for non-ideal behavior. The second half of this thesis considers the problem of SHG in bulk metal vapors. The symmetry of the vapor forbids SHG, yet it has been observed. We consider several models whereby

the symmetry of the vapor is broken by the presence of the laser and compare their predictions to new observations we have made using a few-picosecond laser pulse. The two-lobed output beam profile shows that it is the vapor-plus-beam combination whose symmetry is important. The dependence on vapor pressure demonstrates the coherent nature of the radiation, while the dependence on buffer gas pressure hints at a change of the symmetry in time. The time-dependence is measured directly with a preliminary pump-probe measurement. The magnitude and intensity dependence of the signal are also measured. All but one of the models are eliminated by this comparison. DOE

NON-MARKOVIAN QUANTUM BROWNIAN MOTION OF A HARMONIC OSCILLATOR
J. Tang 1994 15 p
(Contract W-31-109-eng-38)
(DE94-005922; ANL/CHM/PP-79434) Avail: CASI HC A03/MF A01

We apply the density-matrix method to the study of the quantum Brownian motion of a harmonic oscillator coupled to a heat bath. This is a system investigated previously by Caldeira and Leggett using a different method. Unlike the earlier work, in our derivation of the master equation the non-Markovian terms are maintained. Although the same model of interaction is used, discrepancy is found between their results and our equation in the Markovian limit. We also point out that the particular interaction model used by both works cannot lead to the phenomenological generalized Langevin theory of Kubo. DOE

FLUID DYNAMIC NOISE IN A CENTRIFUGAL PUMP Final Report
D. G. Tse and J. H. Whitelaw Aug. 1993 110 p
(Contract N00014-91-C-0172)
(AD-A275264; R93-9245-F) Avail: CASI HC A06/MF A02

Pressure distributions and frequency spectra have been obtained in a centrifugal pump having flow rates between the design point and near shut-down. The pump was comprised of a radial flow impeller with four backswept blades and a single volute. Measurements were obtained at the design flow rate and at off-design conditions to advance understanding of noise generation, to quantify the contribution of tonal, narrowband and broadband components to the overall noise and to develop strategies for suppressing fluid dynamic noise by flow control and active control. Fluid dynamic noise was generated by the unsteady conditions encountered by the impeller blade. Unsteady conditions originated from non-uniformities at the inlet and the impeller outlet at design and off-design conditions. Inlet flow non-uniformity was induced by separation regions. Flow separations are inherent in turbomachinery because of growth of the boundary layer and the disturbance effect of the rotating impeller. Flow non-uniformity at the impeller outlet stemmed from inlet flow non-uniformities in the inlet, from propagation of pressure waves in a vaneless diffuser, and from scroll effects. DTIC

QUADRUPLET EXPANSION OF THE ACOUSTIC PRESSURE FIELD IN A WEDGE SHAPED OCEAN M.S. Thesis
Michael D. Joyce Sep. 1993 40 p
(AD-A275121) Avail: CASI HC A03/MF A01

In a wedge shaped ocean, the method of images is used to develop an analytical approximation of the acoustic pressure field. Contemporary work develops acoustic doublets from a combination of the source and surface reflection image using simple dipole theory. The method of images is then used to sum the dipole images. This thesis matches dipole pairs to achieve a quadruplet expansion. A computer program using the derived quadruplet equation is then created to verify the results by comparing them with the URTEXT program. DTIC

N94-29117# Naval Postgraduate School, Monterey, CA.
A COMPARISON OF TWO COMPUTER MODELS OF SOUND PROPAGATION FOR A WEDGE SHAPED OCEAN OVER A PENETRABLE BOTTOM M.S. Thesis
Charles C. Meisenheimer Sep. 1993 67 p
(AD-A275031) Avail: CASI HC A04/MF A01

The problem of determining the acoustic pressure in a wedge shaped wave guide is examined. Two computer models, one using the method of images, the other using coupled normal modes, are compared. This comparison is over the benchmark wedge of the Acoustic Society of America. Three scenarios were examined: isovelocity water over a pressure release bottom; isovelocity water over a penetrable, lossless bottom; and isovelocity water over a penetrable, lossy bottom. In all cases good agreement was seen between both models, with some differences due to a rigid subbottom in the normal mode model. The strengths and weaknesses of each model are examined. An analytic solution in normal modes of the waveguide with a pressure release surface, rigid bottom and a discontinuous speed of sound profile are presented. A brief history of research into the wedge problem is included in the introduction. DTIC

DETERMINATION OF SOUND POWER LEVELS OF AIR TERMINAL UNITS ACCORDING TO ISO 5135-NORDIC INTER-LABORATORY TESTS, NORDTEST PROJECT NO. 968-91 Technical Report No. 214
G. Andresen and H. G. Jonasson 1993 46 p
(PB94-137411; SP-RAPP-1993-43) Avail: CASI HC A03/MF A01

An inter-laboratory test program to determine the sound power level of air terminal units was carried out. The measurements were performed in accordance with ISO 5135. Four laboratories participated, each carrying out measurements on six test objects: two non-adjustable air terminal units, two adjustable air terminal units and two dampers. The diameters of the chosen units were 125 and 250 mm. The statistical basis for firm conclusions has not been satisfactory. One of the participating laboratories was unable to measure on such low flow rates as those used for the test objects chosen for this investigation and two of the test objects were damaged during the transportation between the participating laboratories. ACOUSTIC AND OPTICAL INVESTIGATIONS OF SUPERFLUID (3)HE

A. Manninen 1993 61 p See also PB93-224889 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-135415) Avail: CASI HC A04

The thesis is an experimental survey of properties of rotating and stationary superfluid (3)He. Two techniques, acoustics and optics, were used. Ultrasound, together with NMR, has provided most of the present experimental knowledge about the superfluid phases of (3)He. The author applied acoustics for the first time to study rotating (3)He. The main result was the discovery of a new vortex in (3)He-A when the magnetic field is low. New phenomena were observed in stationary (3)He as well. Most importantly, one of the collective modes, the real squashing (rsq) mode, of (3)He-B could be excited by means of two-phonon absorption. Superfluid (3)He was studied optically for the first time. No one has previously seen (3)He in the superfluid state. The principal achievement was developing techniques which facilitate optical experiments at temperatures below 1 mK, required to study superfluid (3)He. Optical fibers were used to transmit light between room temperature and the cold parts of the cryostat. Before these investigations, photography had not been done below 10 mK. The usefulness of optics as a probe of the superfluid phases of (3)He was demonstrated by studying the macroscopic shape of the free surface of rotating (3)He-B. The classical parabolic meniscus was observed, which is indicative of the equilibrium density of vortices. The supporting proofs, along with the thesis, is also available. NTIS

CONSIDERATIONS IN THE MODELLING OF SEAFLOOR ACOUSTIC BACKSCATTER Final Report
Rebecca M. Gott, Andrew B. Martinez, and Brian S. Bourgeois 1993 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275404; NRL/PP/7441-92-0002) Avail: CASI HC A02

The modelling of acoustic backscatter has long been of interest to the U.S. Navy because the application of these models offers the possibility of remote characterization of the seafloor. Basic scattering mechanisms and empirical studies of seafloor backscatter are reviewed in this paper. The Rayleigh criterion offers a means of classifying a rough surface. The Rayleigh parameter, a measure of vertical roughness, and the Rayleigh reflection coefficient, a measure of reflection loss between boundaries, are reviewed. The task of modelling the scattering from a surface with two scales of roughness is approached using a combination of two scattering approximations, one valid for small-scale roughness and one valid for large-scale roughness. The method of small perturbation is used for small-scale roughness, and the method of tangent plane, or Kirchoff approximation, is used for large-scale roughness. DTIC

ATTENUATION OF OUTDOOR SOUND PROPAGATION LEVELS BY A SNOW COVER
Donald G. Albert Nov. 1993 111 p
(DA Proj. 4A7-62730-AT-24; DA Proj. 4A7-62730-AT-42)
(AD-A275387; CRREL-93-20) Avail: CASI HC A06/MF A02

The absorption of sound energy by the ground has been studied extensively because of its importance in understanding noise propagation through the atmosphere. This report investigates the attenuative effect of snow on sound propagation, and provides, quantitative measurements and an accurate model for predicting these effects. Summer and winter experiments were conducted at a site in northern Vermont to investigate the effect of a snow cover on low energy sound propagation in the 5- to 500-Hz frequency band for propagation distances between 1 and 274 m. Pistol shots were used as the source of the acoustic waves, with geophones and microphones serving as the receivers. A comparison of the summer and winter recordings revealed a number of effects caused by the introduction of a 0.25-m-thick snow cover. The peak amplitude of the air wave was more strongly attenuated in the winter, with a decay rate proportional to r(exp 1.6) versus r(exp 1.2) in the summer, corresponding to an order of magnitude difference in the signal levels after 100 m of propagation. The waveforms were also markedly changed, with broadened pulses and greatly enhanced low frequencies appearing in the winter recordings. The pulse broadening and peak amplitude decay rates of the acoustic waveforms were successfully predicted theoretically using a layered, rigid, porous model of the snow, with an assumed surface effective flow resistivity of 20 kN s/m to the 4th. Calculations of ground motion induced by the atmospheric sound waves were made using a viscoelastic model of the ground and the wavenumber integration technique. DTIC

(NASA-Case-ARC-12001-1; NAS 1.71:ARC-12001-1;
US-Patent-Appl-SN-149896) Avail: CASI HC A03/MF A01

An acoustic sensor for measuring acoustic waves contained in fluid flowing over the sensor is described. The acoustic sensor reduces any unwanted self-noise associated with the flowing fluid by providing a nose cone having proper aerodynamic properties and by positioning the diaphragm of a microphone of the sensor at a location where any unwanted noise is at a relatively low level. The nose cone has a rounded, blunt or even sharp tip, neither of which creates any major disturbances in the flowing fluid which it intercepts. NASA

A NON-LOCAL COMPUTATIONAL BOUNDARY CONDITION FOR DUCT ACOUSTICS
William E. Zorumski, Willie R. Watson, and Steve L. Hodge Mar. 1994 35 p
(RTOP 505-59-52)
(NASA-TM-109091; NAS 1.15:109091) Avail: CASI HC A03/MF A01

A non-local boundary condition is formulated for acoustic waves in ducts without flow. The ducts are two dimensional with constant area, but with variable impedance wall lining. Extension of the formulation to three dimensional and variable area ducts is straightforward in principle, but requires significantly more computation. The boundary condition simulates a nonreflecting wave field in an infinite duct. It is implemented by a constant matrix operator which is applied at the boundary of the computational domain. An efficient computational solution scheme is developed which allows calculations for high frequencies and long duct lengths. This computational solution utilizes the boundary condition to limit the computational space while preserving the radiation boundary condition. The boundary condition is tested for several sources. It is demonstrated that the boundary condition can be applied close to the sound sources, rendering the computational domain small. Computational solutions with the new non-local boundary condition are shown to be consistent with the known solutions for nonreflecting wavefields in an infinite uniform duct.

A REVIEW OF SIGNAL DETECTION USING THE BISPECTRUM WITH APPLICATIONS IN UNDERWATER ACOUSTICS
G. L. Morella Jan. 1994 93 p
(Contract N00039-92-C-0100)
(AD-A275227; PSU/ARL-TR-94-03) Avail: CASI HC A05/MF A01

This paper reviews attempts at signal detection in Gaussian noise using a higher order statistical (Higher Order Spectra (HOS) or polyspectra) technique. Examples comparing power spectral and bispectral analysis include the following topics: the identification of signals generated by a

system of coupled nonlinear differential equations, radar backscatter processing and target identification, and a statistical treatment of the detection of narrowband harmonic components resulting in a Receiver Operating Characteristic (ROC) curve. The critical signal and noise probability density function (pdf) assumptions from polyspectra theory which must be met for more effective noise suppression relative to classical second order power spectral methods are: (1) discussed in relation to detection results as reported in the literature review; and (2) illustrated via examples using both direct and indirect nonparametric Discrete Fourier Transform (DFT) bispectrums employing Fast Fourier Transforms (FFT) for both simulated and real data. The signal set consisted of pure tones and a hop code used in active sonar. DTIC

REVIEW OF SONIC FATIGUE TECHNOLOGY
B. L. Clarkson (University Coll. of Swansea, Wales.) Apr. 1994 75 p
(Grant NAG1-363; RTOP 763-23-45-70)
(NASA-CR-4587; NAS 1.26:4587) Avail: CASI HC A04/MF A01

From the early-1960s until the mid-1980s, there was very little theoretical development for sonic fatigue prediction. Design nomographs based on simple theoretical models and results of specially designed tests were developed for most common aircraft structures. The use of advanced composites in the 1980s, however, generated an increased interest in development of more sophisticated theoretical models because of the possibilities for a much wider range of structural designs. The purpose of this report is to review sonic fatigue technology and, in particular, to assess recent developments. It also suggests a plan for a coordinated program of theoretical and experimental work to meet the anticipated needs of future aerospace vehicles. Author

SUBJECTIVE RESPONSE TO SONIC BOOMS HAVING DIFFERENT SHAPES, RISE TIMES, AND DURATIONS
David A. McCurdy Mar. 1994 44 p
(RTOP 537-03-21-03)
(NASA-TM-109090; NAS 1.15:109090) Avail: CASI HC A03/MF A01

Two laboratory experiments were conducted to quantify the subjective response of people to simulated outdoor sonic booms having different pressure signatures. The specific objectives of the experiments were to compare subjective response to sonic booms when described in terms of 'loudness' and 'annoyance'; to determine the ability of various noise metrics to predict subjective response to sonic booms; to determine the effects on subjective response of rise time, duration, and level; and to compare the subjective response to 'N-wave' sonic boom signatures with the subjective response to 'minimized' sonic boom signatures. The experiments were conducted in a computer-controlled, man-rated sonic boom simulator capable of reproducing user-specified pressure signatures for a wide range of sonic boom parameters. One hundred and fifty sonic booms representing different combinations of two wave shapes, four rise times, seven durations, and three peak overpressures were presented to 36 test subjects in each experiment. The test subjects in the first experiment made judgments of 'loudness' while the test subjects in the second experiment judged 'annoyance.' Subjective response to sonic booms was the same whether expressed in terms of loudness or in terms of annoyance. Analyses of several different noise metrics indicated that A-weighted sound exposure level and Perceived Level were the best predictors of subjective response. Further analyses indicated that, of these two noise metrics, only Perceived Level completely accounted for the effects of wave shape, rise time, and peak overpressure. Neither metric fully accounted for the effect of duration. However, the magnitude of the duration effect was small over the very wide range of durations considered. Author

Measuring methods, propagation prediction, evaluation and control method of blasting sound are investigated from both theoretical and experimental aspects. Special features of blasting sound are compared with the properties of audible noise and low frequency sound. Problems on the measuring method and the frequency analysis of blasting sound are discussed. Relation between the properties of conventional sound level meter and its output signals are also investigated in relation to the measurement of blasting sound. Limitation on the time resolution and frequency resolution of digital filter and Fourier transform technique is also indicated. Analyzed results by wavelet transform show better time and frequency resolution and better understanding than Wigner-Ville analysis from the comparison of those results. Two methods to predict the time-sound pressures at a receiver are investigated. A control method of blasting sound is discussed theoretically. Possibilities of control of the sound pressure level and the frequency component at a receiver are discussed. Discussion on the evaluation of blasting sound is conducted from two aspects of human perception and response of building fittings. In case of blasting noise, quite high correlation is found between the sound exposure level (SLOW) and the pressure level measured by the 'SLOW' time weighting. Author (NASDA)

DYNAMIC FRACTURE MECHANICS ANALYSIS FOR AN EDGE DELAMINATION CRACK
Stephen A. Rizzi and James F. Doyle Apr. 1994 13 p Proposed for presentation at the Fifth International Conference on Recent Advances in Structural Dynamics, Southampton, England, 18-21 Jul. 1994
(RTOP 505-63-50-10)
(NASA-TM-109106; NAS 1.15:109106) Avail: CASI HC A03/MF A01

A global/local analysis is applied to the problem of a panel with an edge delamination crack subject to an impulse loading to ascertain the dynamic J integral. The approach uses the spectral element method to obtain the global dynamic response and local resultants to obtain the J integral. The variation of J integral along the crack front is shown. The crack behavior is mixed mode (Mode 2 and Mode 3), but is dominated by the Mode 2 behavior. Author

INTERACTION OF SOUND WITH SOUND BY NOVEL MECHANISMS: ULTRASONIC FOUR-WAVE MIXING MEDIATED BY A SUSPENSION AND ULTRASONIC THREE-WAVE MIXING AT A FREE SURFACE Ph.D. Thesis
Harry Jay Simpson 1992 317 p
Avail: Univ. Microfilms Order No. DA9309082

Two mechanisms of sound interacting with sound are experimentally and theoretically investigated. Ultrasonic four-wave mixing in a dilute particle suspension, analogous to optical four-wave mixing in photorefractive

materials, involves the interaction of three ultrasonic wavefields that produces a fourth scattered wavefield. The experimental configuration consists of two ultrasonic (800 kHz) pump waves that are used to produce a grating in a suspension of 25 micron diameter polymer particles in salt water. The pump waves are counter-propagating, which form a standing wavefield in the suspension and the less compressible particles are attracted to the pressure nodes in response to the time averaged radiation pressure. A higher frequency (2 to 10 MHz) ultrasonic wavefield is used to probe the resulting grating. The ultrasonic Bragg scattering is then measured. The scattering depends strongly on the response to the pump wave and is an unusual class of acoustical nonlinearity. Investigation of very small amplitude gratings are done by studying the temporal response of the Bragg scattering to a sudden turn on of a moderate amplitude pump wavefield in a previously homogeneous particle suspension. The Bragg scattering has been verified experimentally and is modeled for early-time grating formations using a sinusoidal grating. The larger amplitude gratings are studied in equilibrium and are modeled using an Epstein layer approximation. Ultrasonic three-wave mixing at a free surface involves the interaction of a high amplitude 400 kHz plane wavefield incident at 33 degrees on a water-air interface with a normally incident high frequency (4.6 MHz) focused wavefield. The 400 kHz 'pump' wavefield reflects from the surface and produces an oscillating surface displacement that forms a local traveling phase grating. Simultaneously the 4.6 MHz 'probe' wavefield is reflected from the free surface. The grating scatters the focused probe wavefield and produces (or contributes to) spatially and Doppler shifted foci relative to the main focus. Dissert. Abstr.

RESONANT ULTRASOUND SPECTROSCOPY FOR ELASTIC CONSTANT MEASUREMENTS
R. D. Dixon, A. Migliori, and L. H. Roe 1993 10 p Presented at the American Welding Society International Conference on Modeling and Control of Joining Processes, Orlando, FL, 8 Dec. 1993
(Contract W-7405-eng-36)
(DE94-005016; LA-UR-93-4477; CONF-931234-5) Avail: CASI HC A02/MF A01

All objects exhibit vibrational resonances when mechanically excited. These resonant frequencies are determined by density, geometry, and elastic moduli. Resonant ultrasound spectroscopy (RUS) takes advantage of the known relationship between the parameters. In particular, for a freely suspended object, with three of the four parameters (vibrational spectra, density, geometry, or elastic moduli) known the remaining one can be calculated. From a materials characterization standpoint it is straight-forward to measure density and geometry but less so to measure all the elastic moduli. It has recently become possible to quickly and accurately measure vibrational spectra, and using code written at Los Alamos, calculate all the elastic moduli simultaneously. This is done to an accuracy of better than one percent for compression and 0.1 percent for shear. RUS provides rapid acquisition of materials information here-to-fore obtainable only with difficulty. It will greatly facilitate the use of real materials properties in models and thus make possible more realistic modeling results. The technique is sensitive to phase changes and microstructure. This offers a change to input real data into microstructure and phase change models. It will also enable measurement of moduli at locations in and about a weld thus providing information for a validating coupled thermomechanical calculations. DOE

COMPUTATIONAL ANALYSIS OF HIGH RESOLUTION UNSTEADY AIRLOADS FOR ROTOR AEROACOUSTICS
Todd R. Quackenbush, C.-M. Gordon Lam, Daniel A. Wachspress, and Donald B. Bliss May 1994 120 p
(Contract NAS1-19303; SBIR-02.09-9282; RTOP 324-02-03)
(NASA-CR-194894; NAS 1.26:194894; CDI-93-12) Avail: CASI HC A06/MF A02

The study of helicopter aerodynamic loading for acoustics applications requires the application of efficient yet accurate simulations of the velocity field induced by the rotor's vortex wake. This report summarizes work to date on the development of such an analysis, which builds on the Constant Vorticity Contour (CVC) free wake model, previously implemented for the study of vibratory loading in the RotorCRAFT computer code. The present effort has focused on implementation of an airload reconstruction approach that computes high resolution airload solutions of rotor/rotor-wake interactions required for acoustics computations. Supplementary efforts on the development of improved vortex core modeling, unsteady aerodynamic effects, higher spatial resolution of rotor loading, and fast vortex wake implementations have substantially enhanced the capabilities of the resulting software, denoted RotorCRAFT/AA (AeroAcoustics). Results of validation calculations using recently acquired model rotor data show that by employing airload reconstruction it is possible to apply the CVC wake analysis with temporal and spatial resolution suitable for acoustics applications while reducing the computation time required by one to two orders of magnitude relative to that required by direct calculations. Promising correlation with this body of airload and noise data has been obtained for a variety of rotor configurations and operating conditions. Author (revised)

EXPERIMENTS ON THE AERODYNAMIC GENERATION OF NOISE IN CENTRIFUGAL TURBOMACHINERY Ph.D. Thesis
Paul Henry Bent 1993 299 p
Avail: Univ. Microfilms Order No. DA9326811

An experimental investigation has been made to identify the aerodynamic sources of noise in centrifugal turbomachinery. Emphasis was placed on the generation of noise at frequencies other than the blade passage frequency and harmonics. Experiments were performed on a centrifugal water pump impeller with seven highly backswept blades running in air. Identification of the acoustic sources was made by measurement of the mean and unsteady flow fields and the radiated noise. Two distinct noise generation mechanisms have been identified. The first is the interaction of the impeller with a highly coherent fluid dynamic instability pattern that forms in the discharge of the impeller. This rotating diffuser stall-like instability pattern rotates around the impeller at a fraction of the impeller speed and is comprised of a series of distinct azimuthal modes. The flow field associated with these modes has been modelled as a rotating vorticity sheet of sinusoidally varying strength. It is hypothesized that due to a potential flow type of interaction, the discharge instability pattern causes the loading on the impeller blades to fluctuate and generate noise. Noise generated by this mechanism is narrow-band in character and occurs at frequencies proportional to the relative rotational speed of the discharge instability and the impeller. Significant constructive interference of the sound occurs when the azimuthal mode order is equal to an integer multiple of the number of impeller blades. The second noise generation mechanism is scattering of sound by the interaction of the discharge flow field turbulence with the trailing edges of the impeller blades. The turbulence convecting in the impeller discharge was found to be comprised of a broad range of length scales. To varying degrees, depending on flow rate, the pressure field associated with the discharge turbulence retains some coherence between the surfaces of adjacent impeller blades close to the trailing edge. When the turbulence is coherent, the resulting noise spectra are comprised of a series of harmonically related broad humps. The turbulent length scales corresponding to the center frequencies of the humps in the noise spectra are equal to integer fractions of the blade spacing. Dissert. Abstr.

NUMERICAL SIMULATIONS OF PIANO STRINGS. PART 1: A PHYSICAL MODEL FOR A STRUCK STRING USING FINITE DIFFERENCE METHODS
Antoine Chaigne and Anders Askenfelt 27 Apr. 1993 29 p Submitted for publication Sponsored by CNRS; Swedish Natural Research Council; Swedish Council for Research in the Humanities and Social Sciences; Bank of Sweden Tercentenary Foundation; and Wenner-Gren Center Foundation
(ISSN 0751-1337)
(TELECOM-93-C-003; ETN-94-95978) Avail: CASI HC A03/MF A01

An improvement to the numerical approach and the underlying physical model made by Hiller and Ruiz in their attempt to generate musical sounds by solving the equations of vibrating strings by means of Finite Difference Methods (FDM) in order to simulate the notion of the piano string with a high degree of realism, is shown. Starting from the fundamental equations of a damped, stiff string interacting with a nonlinear hammer, a numerical finite difference scheme is derived, from which the time histories of string displacement and velocity for each point of the string are computed in the time domain. The interacting force between hammer and string, and the force acting on the bridge, are given by the same scheme. The performance of the model is illustrated by examples of simulated string waveforms. Aspects of numerical stability and dispersion are discussed with reference to the proper choice of sampling parameters. ESA

EMISSION OF SUPERSYMMETRIC NEUTRON PAIR BY CHARGED LEPTON IN MAGNETIC FIELD
Elena V. Arbuzova (Moscow State Univ., Russia.) and A. I. Studenikin Jul. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE93-634365; IC-93/169) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The emission of a supersymmetric neutrino (sneutrino) pair by a charged lepton in a strong magnetic field is investigated. On this base the supersymmetric (mu)-decay and the emission of a sneutrino pair by an electron in a magnetic field are studied in detail. It is shown that the probability of the process with sneutrino can exceed the probability of the analogous process (with neutrino) of the Standard Model. DOE

EXTENDED NONABELIAN SYMMETRIES FOR FREE FERMIONIC MODEL
R. P. Zaikov Aug. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE94-601554; IC-93/237) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The higher spin symmetry for both Dirac and Majorana massless free fermionic field models are considered. An infinite Lie algebra which is a linear realization of the higher spin extension of the cross products of the Virasoro and affine Kac-Moody algebras is obtained. The corresponding current algebra is closed which is not the case of analogous current algebra in the WZNW model. The gauging procedure for the higher spin symmetry is also given. DOE

DISCRETE QUARK-LEPTON SYMMETRY NEED NOT POSE A COSMOLOGICAL DOMAIN WALL PROBLEM
H. Lew and R. R. Volkas 1992 35 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE94-601606; UM-P-92/70; PURD-TH-92/10; OZ-92/22) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

Quarks and leptons may be related to each other through a spontaneously broken discrete symmetry. Models with acceptable and interesting collider phenomenology have been constructed which incorporate this idea. However, the standard Hot Big Bang model of cosmology is generally considered to eschew spontaneously broken discrete symmetries because they often lead to the formation of unacceptably massive domain walls. It is pointed out that there are a number of plausible quark-lepton symmetric models in nature which do not produce cosmologically troublesome domain walls. DOE

(DE94-005417; DOE/ER-40291/20; CONF-9306140-2) Avail: CASI HC A02/MF A01

In theoretical physics one of the most important aspects of coherent states is that they can often be simply and reliably used to investigate the quantum coherence and correlation properties of new dynamical, quantum field theories. First, this paper reviews the coherent/degenerate state treatment of the infra-red dynamics of perturbative QCD. This based on the asymptotic behavior of the Hamiltonian operator as (vert bar)t(vert bar) yields infinity in the interaction representation. Second, the paper reviews

the usage of q-analogue coherent states (vert bar)z greater than (sub q) to deduce coherence and uncertainty properties of the q-analogue quantized radiation field in the (vert bar)z greater than (sub q) 'classical limit' where (vert bar)z(vert bar) is large. Third, for future applications, a new 'projector' definition of the usual coherent states and of the squeezed states is reported. DOE

Perl (Stanford Univ., CA.), and L. S. Rochester (Stanford Univ., CA.) et al Nov. 1993 16 p Presented at the 16th International Symposium on Lepton and Photon Interactions, Ithaca, NY, 10-15 Aug. 1993
(Contracts DE-AC03-76SF-00515; W-7405-eng-48)
(DE94-005225; SU-SLAC-PUB-6378; CONF-930823-18) Avail: CASI HC A03/MF A01

We have performed an experiment to measure accurately the Landau-Pomeranchuk-Migdal (LPM) effect in the production of 5 to 500 MeV photons due to bremsstrahlung of 8 and 25 GeV electron beams traversing thin (2 to 6% X(sub 0)) targets of varying densities. Our measurements confirm that the LPM effect exists and that the Migdal calculations are accurate. We see that, for thin targets, LPM suppression disappears leaving a Bethe-Heitler spectrum, as predicted by theory. For intermediate target thicknesses, we lack an acceptable theory, but have measured energy spectra for targets of differing thickness. We have also measured the production rate of 500 keV to 5 MeV photons at the same electron energies, to study dielectric suppression. We see qualitative agreement with the theory of Ter-Mikaelian; more work is needed before we can make quantitative comparisons. DOE

THE GENERALIZED SPIN-BOSON MODEL FOR ELECTRON-TRANSFER REACTIONS INVOLVING TWO HARMONIC POTENTIALS WITH A DIFFERENT FORCE CONSTANT
J. Tang 1994 23 p
(Contract W-31-109-eng-38)
(DE94-005470; ANL/CHM/PP-80389) Avail: CASI HC A03/MF A01

The generalized spin-model is employed to analyze the electron-transfer reactions involving two harmonic potentials with a different force constant. An analytical expression for the nonadiabatic rate constant is derived with fill consideration of the effects of quantum modes. For a single dominant solvent mode at low frequency, the result of the high temperature regime is reduced to the formula derived earlier based on the stochastic Liouville theory. For multiple soft solvent modes, the rate constant is a convoluted integral of a rate function for each individual single mode. DOE

A MEASUREMENT OF THE TAU POLARIZATION AT THE RESONANCE WITH THE DELPHI DETECTOR AT LEP Ph.D. Thesis
Antonio Wong Chan Jul. 1993 148 p
(Contract W-7405-eng-82)
(DE94-005557; IS-T-1654) Avail: CASI HC A07/MF A02

The polarization of tau leptons produced in the reaction e(sup +)e(sup -) yields tau(sup +)(tau)(sup -) near the peak of the Z degree resonance has been measured using a sample of 24,904 tau(sup +)(tau)(sup -) events, with an estimated background of 1.5%. We have selected 4562 tau yields e(nu)(bar nu) 2218 (tau) yields (pi)(nu) and 5133 tau yields (rho)(nu) candidates. The mean value obtained is P(sub tau) = -0.176 +/- 0.029. This corresponds to a ratio of the neutral current vector to the axial-vector coupling constants of the tau lepton of g(sub V)(sup tau)/g(sub A)(sup tau) = 0.088 +/- 0.014. This leads to a value of the electroweak mixing angle of sin(exp 2)(theta)(sub W) = 0.2280 +/- 0.0036. This result is in good agreement with previous measurements of the weak mixing angle from the study of the Z degree lineshape and the forward-backward asymmetries in the processes Z degree yields l(sup +)l(sup -) and Z degree yields q(bar q). DOE

PROPERTIES OF W + JET EVENTS IN PROTON-ANTIPROTON COLLISIONS AT 1.8 TeV Ph.D. Thesis
R. B. Drucker (California Univ., Berkeley.) 22 Nov. 1993 189 p
(Contract DE-AC03-76SF-00098)
(DE94-004002; LBL-34738) Avail: CASI HC A09/MF A02

W boson + QCD jet events, produced in 1.8 TeV proton-antiproton collisions and measured by the Collider Detector at Fermilab (CDF), were used to measure the center-of-mass production angle of the W + jet system, and were also used to place limits on the production of excited quark states. The center-of-mass production angular distribution agrees well with leading order and next-to-leading order QCD predictions. Excited quark states were searched for in the reaction q + g yields q* yields q + W. Upper limits on the q* cross section, as a function of the q* mass, are shown. Comparison with a theoretical prediction for q* production excludes excited quark states with a mass in the range 150-530 GeV/c(exp 2), at 95% confidence. DOE

N94-28531# Wisconsin Univ., Madison.
PROPERTIES OF EVENTS CONTAINING A PHOTON AND SEVERAL JETS SEEN IN P(BAR P) COLLISIONS AT (RADICAL)S = 1.8 TeV Ph.D. Thesis
P. A. Maas 1993 172 p

DENSITY REDUCTION: A MECHANISM FOR AMORPHIZATION AT HIGH ION DOSES
E. D. Specht, S. J. Zinkle, and D. A. Walko 1993 6 p Presented at the Materials Research Society Meeting, Pittsburgh, PA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-004793; CONF-9311153-1) Avail: CASI HC A02/MF A01

At cryogenic temperatures, the accumulation of vacancy-interstitial pairs in AlO3 from atomic displacements associated with ion implantation produces amorphization. At room temperature, these pairs recombine, and amorphization occurs only at high doses. X-ray reflectivity measurements show that amorphization of the surface of Al2O3 implanted at room temperature with 160 keV Cr(+) ions is preceded by a progressive reduction in near-surface density. Monte Carlo simulations show that this density reduction can be accounted for by high-energy-transfer collisions which knock atoms deep into the target, leaving widely separated vacancies and interstitials, which do not recombine. Electron microscopy shows that at least some of these vacancies condense into voids. We propose that this reduction in near-surface density can lead to amorphization at high doses. We present simple approximations for the density reduction expected for different ions and targets. DOE

DERIVATION OF A FOKKER-PLANCK EQUATION FOR BUNCHED BEAMS
Alessandro G. Ruggiero Nov. 1993 5 p Presented at the CERN Workshop on Beam Cooling and Related Topics, Geneva, Switzerland, 4-8 Oct. 1993
(Contract DE-AC02-76CH-00016)
(DE94-004950; BNL-49554-Rev; CONF-9310193-10-Rev) Avail: CASI HC A01/MF A01

This report investigates the derivation of the Fokker-Planck equation which is used to evaluate the evolution with time of an ensemble of particles under the effect of external RF forces, cooling, and forces of stochastic nature. The conventional approach based on the classical work by Chandrasekhar is outlined; the phase angle and the momentum error of the particles are used. The method is then extended to the case where the distribution function is expressed in terms of the amplitude of motion. To avoid a singularity behavior, the new Fokker-Planck equation is obtained with an averaging process over the phase distribution instead of the time-averaging. The beam lifetime in the presence of the separatrix of the RF buckets is determined. Finally, the numerical estimates are applied to the Relativistic Heavy Ion Collider (RHIC). DOE

Annual Progress Report
L. E. Holloway and T. A. OHalloran May 1993 14 p
(Contract DE-FG02-91ER-40677)
(DE94-004955; DOE/ER-40677/2-Pt-1) Avail: CASI HC A03/MF A01

Continued progress has been made in isolating the variables needed to completely specify a quark or gluon jet, independent of the process in which it is created. We have evidence of a slow, but statistically significant, dependence on the sub-energy of the hard process in which the jet arises. Once this is taken into account, jets from e(+)e(-) are consistent with those created in p(bar p). Neural network jet identification studies will be based on this expanded set of variables. Work on the new type of Dirac equation for a relativistic oscillator was presented at the International Conference on High Energy Physics in Dallas and will be published in the Proceedings of the Conference. Theoretical studies involving jet signals for theoretically predicted (but as yet undiscovered) particles are underway. DOE

PHYSICS AT HERA
M. Derrick 1993 18 p Presented at the 23rd International Symposium on Multiparticle Dynamics, Aspen, CO, 13-17 Sep. 1993
(Contract W-31-109-eng-38)
(DE94-005117; ANL-HEP-CP-93-105; CONF-9309297-2) Avail: CASI HC A03/MF A01

HERA is the first electron-proton colliding beam facility and the big news about it is that it works, despite concerns both about the reproducibility of the magnetic field in the proton ring magnets at injection and about the e-p beam-beam interaction. It is, however, a complex accelerator facility that will take a few years to bring up to full and efficient operation. With the present center of mass energy of 296 GeV, it extends the energy range for photoproduction studies by an order of magnitude over fixed target experiments and deep-inelastic e-p scattering up to momentum transfer values approaching 10(sup 5) GeV(sup 2) in both neutral and charged current interactions. At reasonable Q(sup 2), and so with the present luminosity, events with Bjorken x down to a few times 10(sup -5) are being studied. Two powerful general-purpose detectors -- H1 and ZEUS -- have been constructed to address these physics challenges and both collaborations have made new and interesting measurements as presented at this and other recent HEP conferences. The experimental program started

in July 1992 and we are on a steep learning curve both with HERA and with the detectors. DOE

This progress report describes the participation of members of the Nevis group in different experiments during the FY93 period. There was major involvement in: BNL/AGS experiment E802/859/866; BNL RHIC experiment PHENIX; and CERN/SPS experiment NA44. The group was also involved in the small scale experiment E858/878 at BNL/AGS. For the BNL/AGS experiment data collection is now complete, and the group is involved in data analysis. Contributions to systematic procedures for measuring and maintaining the high calibration of the time-of-flight system, along with the previously developed trigger system have been significant contributions to the physics which is beginning to emerge from this heavy ion experiment. The CERN experiment has published first results on S-Pb collisions, with emphasis on two particle correlations. The group has been actively involved in data collection this year. Emphasis is being placed on proton-proton interactions in S-Pb and proton-Pb collisions. The PHENIX experiment is aimed at measuring signatures of quark-gluon plasma. The Nevis group has been actively involved in this experiment from design of the time-of-flight and trigger system, to acting as experiment spokesman. DOE

SURFACE STRUCTURE AND STEREOCHEMICAL PROPERTIES OF SELF-ASSEMBLED MONOLAYER MATERIALS
Dec. 1993 6 p
(Contract DE-FG02-93ER-45503)
(DE94-004960; DOE/ER-45503/1) Avail: CASI HC A02/MF A01

This document reports the progress made in support of a proposal to generate well-characterized, well-ordered organic surfaces and to impinge upon the array of oriented organic molecules a well-collimated beam of radical atoms at a well-defined angle of incidence. Using the intensity of helium atom diffraction from the organic surface as a measure of the number of unreacted molecules at the surface, the rate of the reaction is measured. The angle of incidence of the reactive atom beam is varied and the measurement is repeated. In this manner the reactivity of the molecules on the surface is mapped out as a function of the angle of incidence of the reactive moiety. To carry out this experiment requires that two fields of research be brought together: molecular beam technology and the science/art of growing well-ordered organic surfaces. The first half of this report describes recent helium diffraction results from molecular beam deposited organic monolayers (structural layer characterization work). The second half reports progress in constructing and characterizing the reactive atom (oxygen) beam source. DOE

DEEP INELASTIC LEPTON SCATTERING ON NUCLEI: OPERATOR PRODUCT EXPANSION AND MESON-NUCLEON THEORY
L. P. Kaptari and A. Yu. Umnikov 1992 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-606442; JINR-E-2-92-388) Avail: CASI HC A03 (US Sales Only)

A novel point of view on the x-rescaling model in lepton-nucleus deep inelastic scattering is suggested. Using the operator product expansion method within the effective meson-nucleon theory, a rigorous consideration of the scattering on the deuteron is presented. It is demonstrated that with the contributions interpreter as the Fermi motion corrections, the x-rescaling idea is exactly reproduced. The diagrams of scattering of bound nucleons have also been computed numerically. An example of application of the method, viz. the problem of extraction of the neutron structure function from the combined proton-deuteron data, is considered. DOE

MASSES AND MIXING OF LEPTONS AND QUARKS (DIRAC PARTICLES)
Kh. M. Beshtoev 1993 6 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-606446; JINR-R-2-93-44) Avail: CASI HC A02 (US Sales Only)

The work is devoted to the discussion of the question on influence of different types of interactions on the mass matrix of leptons and quarks. The conclusion is made that electromagnetic and strong interactions do not influence on nondiagonal elements of the mass matrix of leptons and quarks. It is shown, for specific (left) character of weak interaction, the interaction does not contribute to the mass matrix of leptons and quarks and so does not lead to the mixing of leptons and quarks due to the masses. NUMERICAL SOLUTION OF THE MULTICHANNEL SCATTERING PROBLEM
V. I. Korobov 1992 10 p Limited Reproducibility: More than 20% of

this document may be affected by microfiche quality
(DE94-606297; JINR-E-11-92-357) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

A numerical algorithm for solving the multichannel elastic and inelastic scattering problem is proposed. The starting point is the system of radial Schroedinger equations with linear boundary conditions imposed at some point R = R(sub m) placed somewhere in asymptotic region. It is discussed how the obtained linear equation can be split into a zero-order operator and its perturbative part. It is shown that Lentini - Pereyra variable order finite-difference method appears to be very suitable for solving that kind of problems. The derived procedure is applied to d(mu)+t yields t(mu)+d inelastic scattering in the framework of the adiabatic multichannel approach. DOE

(Contract DAAL03-90-G-0112)
(AD-A275511; ARO-27780.18-PH) Avail: CASI HC A03

Work over a three year period on the optical and dielectric properties of a sequence of ionic molecular solids such as K2SeO4, KNO, and NaNO2 is described. This work had both experimental and theoretical components. Principally, the experiments used light scattering and birefringence to monitor structural and optical changes associated with solid-solid phase transitions. Theoretical studies concentrated on developing a unified theory of the ionic interactions in these systems which resulted in parameter free molecular dynamics simulations which closely reproduced the observed transition and structural behavior of these increasingly complex systems. ENHANCED ION DISSOCIATION OF LiCF3SO3 BY NEW CARBONATE PLASTICIZERS: RAMAN AND IR STUDIES
L. K. Hanson, H. S. Lee, X. Q. Yang, and J. McBreen 1993 8 p Presented at the 184th Meeting of the Electrochemical Society, New Orleans, LA, 10-15 Oct. 1993
(Contract DE-AC02-76CH-00016)
(DE94-005448; BNL-48999; CONF-931024-7) Avail: CASI HC A02/MF A01

The extent of ion dissociation of LiCF3SO3 in propylene carbonate (PC) and new, modified carbonates (MC-3, MC-5) prepared in our laboratory has been determined by Raman spectroscopy. In the modified carbonates the polyether groups -CH2(OCH2CH2) (sub n)OCH3 (n = 3 for MC-3 and n = 5 for MC-5) replace the 4-CH3 substituent of PC. The spectra clearly show that both MC-3 and MC-5 promote ion dissociation of the Li triflate salt relative to PC. Furthermore, MC-5 solutions contain more free ions than MC-3 solutions, and are less affected by concentration changes. Infrared spectra demonstrate that Li(+) cations associate less with the carbonyl of the modified carbonates than with the carbonyl of PC. These results suggest that the enhanced ion dissociation of Li triflate in MC-3 and MC-5 arises from complexation of the Li(+) to the oxygens of the polyether sidechains, and that MC-5 with its six ether oxygens forms the more stable complex. STRUCTURE OF ORDINARY ICE I(SUB h). PART 1: IDEAL STRUCTURE OF ICE Special Report
Victor F. Petrenko Oct. 1993 30 p
(Contract DAAL03-91-G-0164)
(AD-A275149; CRREL-SR-93-25) Avail: CASI HC A03/MF A01

This report examines the defect-free structure of ordinary I(sub h), reviewing experimental results and theoretical models of the arrangement of oxygen and hydrogen atoms and the electronic structure of ice. Special attention is given to the results of studies from the last two decades. Among the experimental techniques under consideration are X-ray diffraction, optical absorption, X-ray photoelectron spectroscopy and ultraviolet optical spectroscopy, nuclear magnetic resonance, and electron spin resonance. The main subjects discussed are the chemical content of ice, the structure and properties of water molecules, hydrogen bonds, phase transitions, protonic disorder, and electron energy spectrum of ice. THE EFFECTS OF MOLECULAR ORIENTATION GEOMETRY AND SURFACE ANISOTROPY UPON ETCHING Final Report, 15 Jan. 1992 - 14 Jan. 1994
Andrew C. Kummel Dec. 1993 3 p
(Grant AF-AFOSR-0390-89)
(AD-A275154; AFOSR-94-0039TR) Avail: CASI HC A01/MF A01

Sticking probabilities have been measured for molecular chlorine upon the GaAs (100) Ga-rich c(8x2), GaAs(100) As-rich c(2.8), and GaAs(110) stoichiometric (1x1) surfaces. The sticking probability was measured as a function of incident translational energy (0.038 to 0.66 eV), surface temperature (150-835 K), angle of incidence (0 to 37 deg), and surface chlorine coverage. Our data indicate the presence of both precursor and direct activated chemisorption mechanisms on all three surfaces. Total energy scaling is observed on both the GaAs(100) Ga-rich c(8x2) surface and the stoichiometric (1x1) surface for both precursor mediated and direct activated chemisorption indicating a highly corrugated gas-surface interaction potential. DTIC

HALOGEN CHEMISORPTION ON SILVER(111): SCANNING TUNNELING MICROSCOPY OF COADSORBED HALOGEN ATOMS
Joachim H. Schott and Henry S. White 20 Jan. 1994 26 p
(Contract N00014-91-J-1927)
(AD-A275219) Avail: CASI HC A03/MF A01

The structures of halogen monolayers (I, Br, Cl, and F) and mixed halogen monolayers on Ag(111) surfaces are measured by scanning tunneling microscopy (STM). Adatom radii determined from nearest-neighbor bond distances are in excellent agreement with literature values of the radii of halides, indicating that the adsorbed halogen atoms have an essentially ionic character and are adsorbed as a surface Ag-halide complex. STM images of mixed halogen adlayers comprised of either coadsorbed I and Cl, I and F, or Cl and F, exhibit several structural features, e.g. a low frequency moire pattern and a large atom vacancy density, that are not observed in single-atom adlayers and that are ascribed to coulombic forces within the ionic adlayer. STM has also been used to monitor variations in adlayer structures following ion exchange of chemically distinct halogen species. STM images and data obtained from Auger electron spectroscopy indicate that the chemical stability of the surface Ag halide complexes in aqueous solutions decreases with increasing halogen electronegativity. The results suggest that the energy of solvation of the halide ions determines the relative stability of the Ag-halide surface bond similar to that observed for bulk Ag halide crystals. DTIC

COMPUTER SIMULATION OF MOLECULAR INTERACTIONS IN SUPERCRITICAL SOLVENTS Technical Report, 1 Dec. 1992 - 30 Nov. 1993
P. G. Debenedetti 30 Nov. 1993 27 p
(Contract F49620-93-I-0040)
(AD-A274977; AFOSR-94-0036TR) Avail: CASI HC A03/MF A01

Integral equation calculations were performed on two model supercritical mixtures: naphthalene in carbon dioxide (nonvolatile solute; attractive mixture) and neon in xenon (volatile solute; repulsive mixture). Both systems were studied at high dilution, at supercritical temperature, and over a broad range of densities. The attractive system exhibited significant short-ranged solvent enrichment around the solute. The difference between the solvent density averaged over three solvation shells, and the bulk solvent density was found to be more pronounced between 50 and 80% of the solvent's critical density. In contrast, the repulsive system exhibited local solvent depletion near the solvent's critical point. The extent of the solvation region responsible for determining the solute's chemical potential varies between three and five solvent diameters for the attractive mixture, with the maximum occurring near the solvent's critical density. At 60% of the solvent's critical density, the local concentration of naphthalene molecules around each other is almost ten times higher than in the bulk. Dynamic simulations of pyrene in carbon dioxide revealed insignificant solute-solute aggregation. The mean lifetime of transient solute dimers, roughly 0.8 picoseconds, was found not to change even when the bulk density was varied by a factor of four. DTIC

ISSUES IN LIGHT HADRON SPECTROSCOPY
D. Morgan Oct. 1993 32 p
(PB94-138229; RAL-93-078) Avail: Issuing Activity (National Technical Information Service (NTIS))

A high priority in light hadron spectroscopy is to seek out and characterize various types of non-(Q,Q bar) meson. The large quantity of new data now appearing will present a great opportunity. To identify the non-(Q,Q bar) intruders one needs to know the regular (Q,Q bar) pattern well; whole meson families thus become a target for close investigation. A powerful discovery strategy is to observe the same meson in a variety of reactions. Because mesons appear as resonances, other dynamics can distort the signal in a particular decay channel. Unitarity is the master principle for co-ordinating various sightings of the same resonance. Much of the new spectroscopic information in prospect will come from inferring two-body dynamics from three-body final states. Conventional methods of analysis via the isobar model use approximations to unitarity that need validation. Of all the meson families, the scalars should be a prime hunting ground for non-(Q,Q bar)'s. Even before the advent of the new results, some revisions of the 'official' classifications are urged. IMPROVED QCD SUM RULE ESTIMATES OF THE HIGHER TWIST CONTRIBUTIONS TO POLARISED AND UNPOLARISED NUCLEON STRUCTURE FUNCTIONS
G. G. Ross and R. G. Roberts Dec. 1993 14 p Prepared in cooperation with Oxford Univ., Englan d
(PB94-138112; RAL-93-092) Avail: Issuing Activity (National Technical Information Service (NTIS))

We re-examine the estimates of the higher twist contributions to the integral of g(sub 1), the polarized structure function of the nucleon, based on QCD sum rules. By including corrections both to the perturbative contribution and to the low energy contribution, we find that the matrix elements of the relevant operators are more stable to variations of the Borel parameter M(sup 2), allowing for a meaningful estimate of the matrix elements. We find that these matrix elements are typically twice as large as previous estimates. However, inserting these new estimates into the recently corrected expressions for the first moments of g(sub 1) leads to corrections too small to affect the phenomenological analysis. For the unpolarized case, the higher twist corrections to the GLS and Bjorken sum rules are substantial, and bring the estimate of Lambda(sub QCD) from the former into good agreement with that obtained from the Q(sup 2) dependence of deep inelastic data. SHAMAN is an expert system for the qualitative identification of radionuclides in the measured gamma spectrum. The goal of SHAMAN is to correctly identify all radionuclides in the sample and to quantitatively determine their activities and all related parameters. This report documents the SHAMAN system starting from the algorithmic level and ending with programming issues. The first three chapters give an overview of the initial problem of radionuclide identification and expert system concepts in general. Chapters 4 and 5 present the special programming interface of SHAMAN. The entire methodology of SHAMAN system ranging from fundamental algorithms to data processing is contained in chapters 6-10. The last chapter of the report is devoted to performance issues and conclusions presenting some test results. NTIS

SOME REMARKS ABOUT PSEUDO-HAMILTONIAN
N. Malitsky, G. Bourianoff, and Yu. Severgin Nov. 1993 13 p
(Contract DE-AC35-89ER-40486)
(DE94-003273; SSCL-648) Avail: CASI HC A03/MF A01

For the many applied tasks of accelerator physics, the four dimensional single particle pseudo-Hamiltonian may be presented as the Hamiltonian of the near-integrable system consisting of integrable and perturbed terms. The KAM theorem states that for sufficiently small perturbation the invariant surfaces continue to exist and, for the systems with two degrees of freedom, completely isolate the thin stochastic layers. As the perturbation strength increases, a transition can occur in which these surfaces disappear and the stochastic layers connect, resulting in globally stochastic motion. One of the important problems is to determine this 'boundary' invariant surface. There are several approaches that may be used to describe the regular trajectories in the small limited region. The most powerful method is the perturbation theory which allows us to study the combined influence of the different multipoles. The inclusion of Lie operators improved this method and developed it up to high order perturbation. But the perturbation theory failed to describe the change in topology and since the regular trajectories depend discontinuously on choice of initial coordinates, it cannot be used in the whole region of the stable motion. The authors suggest limiting attention to the study of the 'boundary' invariant and implementation of the additional 'local' transformation. The authors briefly review the well known theories, their advantages and imperfections, and the necessity of the 'local' transformation. They present the comparison of the map tracking with the invariants determined by the perturbation methods. DOE

PERFORMANCE OF CVD AND CVR COATED CARBON-CARBON IN HIGH TEMPERATURE HYDROGEN
J. W. Adams, R. E. Barletta, J. Svandrlik, and P. E. Vanier 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC02-76CH-00016)
(DE94-005451; BNL-49299; CONF-931108-44) Avail: CASI HC A02/MF A01 (US Sales Only)

As a part of the component development process for the particle bed reactor (PBR), it is necessary to develop coatings which will be time and temperature stable at extremely high temperatures in flowing hydrogen. These coatings must protect the underlying carbon structure from attack by the hydrogen coolant. Degradation which causes small changes in the reactor component, e.g. hole diameter in the hot frit, can have a profound effect on operation. The ability of a component to withstand repeated temperature cycles is also a coating development issue. Coatings which crack or spall under these conditions would be unacceptable. While refractory carbides appear to be the coating material of choice for carbon substrates being used in PBR components, the method of applying these coatings can have a large effect on their performance. Two deposition processes for these refractory carbides, chemical vapor deposition (CVD) and chemical vapor reaction (CVR), have been evaluated. Screening tests for these coatings consisted of testing of coated 2-D and 3-D weave carbon-carbon

in flowing hot hydrogen at one atmosphere. Carbon loss from these samples was measured as a function of time. Exposure temperatures up to 3,000 K were used, and samples were exposed in a cyclical fashion cooling to room temperature between exposures. The results of these measurements are presented along with an evaluation of the relative merits of CVR and CVD coatings for this application. DOE

OPTICAL FIELD IONIZATION OF ATOMS AND IONS USING ULTRASHORT LASER PULSES Ph.D. Thesis
D. N. Fittinghoff Dec. 1993 156 p
(Contract W-7405-eng-48)
(DE94-006643; UCRL-LR-115496) Avail: CASI HC A08/MF A02

This dissertation research is an investigation of the strong optical field ionization of atoms and ions by 120-fs, 614-run laser pulses and 130-fs, 800-nm laser pulses. The experiments have shown ionization that is enhanced above the predictions of sequential tunneling models for He(+2), Ne(+2), and Ar(+2). The ion yields for He(+1), Ne(sup +1) and Ar(sup +1) agree well with the theoretical predictions of optical tunneling models. Investigation of the polarization dependence of the ionization indicates that the enhancements are consistent with a nonsequential ionization mechanism in which the linearly polarized field drives the electron wavefunction back toward the ion core and causes double ionization through inelastic e-2e scattering. These investigations have initiated a number of other studies by other groups and are of current scientific interest in the fields of high-irradiance laser-matter interactions and production of high-density plasmas. This work involved the following: (1) Understanding the characteristic nature of the ion yields produced by tunneling ionization through investigation of analytic solutions for tunneling at optical frequencies. (2) Extensive characterization of the pulses produced by 614-nm and 800-ran ultrashort pulse lasers. Absolute calibration of the irradiance scale produced shows the practicality of the inverse problem--measuring peak laser irradiance using ion yields. (3) Measuring the ion yields for three noble gases using linear, circular and elliptical polarizations of laser pulses at 614-nm and 800-nm. The measurements are some of the first measurements for pulse widths as low as 120-fs. DOE

EFFECTS OF DIFFUSION AND INERTIA ON CHAOTIC MIXING: A COMPUTATIONAL AND EXPERIMENTAL STUDY Ph.D. Thesis
Pradip Dutta 1992 191 p
Avail: Univ. Microfilms Order No. DA9313586

The role of molecular diffusion and transient velocities in the overall mixing of particles by chaotic advection produced in a periodic journal-bearing flow is studied numerically and experimentally. For the numerical study, the Lagrangian description of diffusing particles is modeled by the use of the Langevin equation, in which the effective velocity of a diffusing particle is expressed as the sum of the deterministic velocity (as a result of the flow solution) and a stochastic component arising out of the Brownian motion of the molecules. The stochastic component is modelled as a Gaussian process with zero mean and variance proportional to the diffusivity, D. Two separate cases are considered in obtaining the deterministic velocity. In the first case, the flow solution is obtained analytically by making Stokes approximation. Numerical experiments are performed by stirring a blob of particles for a few cycles and then reversing the flow. It is observed that the mean square separation (after flow reversal) of the diffusing particles initialized in chaotic regions are a few times greater than those initialized in regular regions. The main causes of enhancement of separation are identified to be stretching and folding of material lines. Corresponding experimental observations are made by taking photographs of blobs of dye before and after stirring, and by analyzing the pictures by digital image processing. For a few cycles, there is a good agreement between the numerical results and the experimental observations. But, for longer stirring, the final distribution of particles after flow reversal predicted numerically deviates from the corresponding experimental results. The cause of this deviation is believed to be the omission of the transient terms from the governing momentum equation. Hence, in the second case, the effect of diffusion is studied in the presence of transient velocities. The flow solution is obtained for the transient Navier-Stokes equation in the eccentric annulus geometry by a finite difference method using the stream function-vorticity formulation and ADI method in a curvilinear coordinate system. On including the effects of transient velocities in the numerical model, there is a striking agreement with experimental observations even for higher numbers of cycles of stirring. The transient effects, however, are not significant if the advection is not chaotic. Dissert. Abstr.

A TEVATRON COLLIDER BEAUTY FACTORY
1992 57 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AS05-80ER-10629)
(DE94-004879; DOE/ER-10629/T9) Avail: CASI HC A04

This document which is labeled a final report consists of several different items. The first is a proposal for a detector to be developed for beauty physics. The detector is proposed for the Fermilab Tevatron and would be designed to measure mixing reactions, rare decay modes, and even CP violation in hadron collider beauty production. The general outline of the work proposed is given, and an estimate of the time to actually design the detector is presented, along with proposed changes to the Tevatron to accommodate the system. A preliminary report on an experiment to verify a reported observation of a 17 keV neutrino in tritium decay is presented. The present results in the decay spectra actually showing a depression below expected levels, which is not consistent with a massive neutrino. Additional interest has been shown in finishing an electrostatic beta spectrometer which was started several years previously. The instrument uses hemispherical electrostatic electric fields to retard electrons emitted in tritium decay allowing measurement of integral spectra. The design goal has a 5 eV energy resolution, which may be achievable. A new PhD student is pursuing this experiment. Also the report contains a proposal for additional work in the field of non-perturbative quantum field theory by the theoretical group at OU. The work which is proposed will be applied to electroweak and strong interactions, as well as to quantum gravitational phenomena. DOE

COMPARISON OF 14 MeV ISOMER PRODUCTION OF Hf-178m1 AND Hf-179m2 USING FESHBACH-KERMAN-KOONIN AND EXCITON PREEQUILIBRIUM MODELS
M. B. Chadwick (Lawrence Livermore National Lab., CA.) and P. G. Young 1993 12 p Presented at the 2nd International Atomic Energy Authority/Coordinated Research Program (IAEA/CRP) Meeting on Activation Cross Sections for the Generation of Long-Lived Radionuclides, San Diego, CA, 29-30 Apr. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-002640; LA-UR-93-3632; CONF-940459-2) Avail: CASI HC A03

The Hf-178m2(16+) isomeric state has a 31-yr half life and could pose serious radioactive problems in nuclear fusion reactors if its production in 14 MeV neutron-induced reactions is significant. We present statistical/pre-equilibrium model calculations for the production of this isomer in the Hf-179(n, 2n) Hf-178m2 reaction, as well as the 25-days 12.5(-) isomer in the Hf-179(n,n')Hf-179m2 reaction, using two different preequilibrium models: the exciton model and the Feshbach-Kerman-Koonin (FKK) theory. Our calculations which use the exciton model agree well with measurements, but those with the FKK theory underestimate measurements. Our calculations are the first to probe angular momentum transfer effects in the FKK theory and suggest that, as it is presently applied, high spin-transfer reactions are underestimated. We suggest modifications to the FKK statistical averaging procedure which may result in an improved agreement with experiment. DOE

INCLUSIVE JET AND DIRECT PHOTON PRODUCTION AT THE D0 EXPERIMENT
J. Kotcher (Superconducting Super Collider Lab., Dallas, TX.) Dec. 1993 9 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-006001; FNAL/C-93/387-E; CONF-9310247-9) Avail: CASI HC A02/MF A01

Preliminary measurements of the inclusive jet and single photon production cross sections in p(bar p) collisions at sq. root of delta = 1.8 TeV by the D0 experiment at the Fermilab Tevatron are reported. The inclusive jet cross sections in various pseudorapidity ranges covering (vert

bar)(eta)(vert bar) less than 3 are presented, along with comparisons to next-to-leading order QCD predictions. The single photon cross section in the central region ((vert bar)(eta)(vert bar) less than 0.9) is also presented, as is a description of the conversion method used to determine the background contamination. The single photon cross section is compared to a recent next-to-leading logarithm QCD calculation. DOE

ON POSSIBILITY TO CREATE THE SCINTILLATION TRIGGER FOR LIQUID-ARGON NEUTRINO DETECTOR
S. V. Belikov, S. N. Gurzhiev, V. I. Kochetkov, and V. S. Startsev 1992 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-607844; IFVE-ONF-92-24) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

Different methods of the trigger organization for the liquid argon neutrino detector of the Tagged Neutrino Facility are discussed and the construction of the fast scintillating trigger using polymethylmethacrylate as the base of the scintillator is proposed. As a result of experimental investigations, photomultiplier PM-84-3 with a standard devider was choosen. Characteristics for the scintillator and the wavelength shifter, which are required for creating a highly efficient (90%) fast less than or equal to 5 ns trigger suitable for a liquid argon under increased pressure (P less than or equal to 3 atm) were defined. DOE

SPECTROSCOPIC AND DYNAMICAL STUDIES OF HIGHLY ENERGIZED SMALL POLYATOMIC MOLECULES
R. W. Field and R. J. Silbey 1993 11 p
(Contract DE-FG02-87ER-13671)
(DE94-006509; DOE/ER-13671/7) Avail: CASI HC A03/MF A01

Stimulated emission pumping was used to determine molecular constants and linewidths of vibrational levels of HCO (tilde X)(sup 2)A' state in an energy region. Some of the results of the initial study of the HCO (tilde B)(left arrow)(tilde X) transition were the subject of ab initio calculations. A paper was written which provides a lineshape and linestrength theory for Frequency Modulation (FM) enhanced Magnetic Rotation Spectroscopy (free radical spectroscopy). Pulsed dye amplification does not degrade the sensitivity of FM spectroscopy; a pulsed amplified FM spectrometer is being set up. A superpolyad model is being tested and extended for acetylene states. An ICCD-DF (intensified change-coupled detector-dispersed fluorescence) scheme is being set up. DOE

ON RELATIVITY PRINCIPLE VIOLATION IN LOCAL MEASUREMENTS OF SPIN PRECESSION OF MOVING PARTICLES
B. S. Neganov 1992 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608067; JINR-D-2-92-446) Avail: CASI HC A03 (US Sales Only)

The repeated analysis of spin precession phenomenon of relativistic charged particles was performed. The inevitability of the relativity principle violation on local measurements of spin precession was shown while particle moving along a curvilinear trajectory due to the Thomas precession. The simplest deduction of spin equations of motion has been received in the fixed and reference frames. The possibility to determine the Earth's absolute velocity by means of measuring the azimuthal asymmetry of spin precession was shown. Besides, Lorentz's etheric conception is being developed as a more fundamental theory, which establishes the limits of existing phenomenological method of the conventional isotropic description of the phenomena in moving reference frames within the limits of the special relativity theory. STATISTICAL DESCRIPTION OF HOT AND DENSE CLUSTERING MATTER
A. A. Shanenko, E. P. Yukalova, and V. I. Yukalov 1992 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608155; JINR-E-2-92-378) Avail: CASI HC A03 (US Sales Only)

A statistical model is constructed by treating hadrons as clusters of elementary objects, gluons and quarks. The basis of the model is an effective cluster Hamiltonian. The principle of thermodynamic equivalence for Hamiltonians is formulated, which makes it possible to describe all the thermodynamics of the system with an effective Hamiltonian in a completely correct way. To check the accuracy of the model, detailed calculations for the region of zero baryon density have been made for which computer simulations on the lattice are known. The results are found to be in good agreement with the lattice numerical data. DOE

MODELLING OF MULTIPARTICLE PRODUCTION BY DYNAMICAL SEMIGROUP METHOD
B. F. Kostenko 1992 19 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608132; JINR-R-2-92-580) Avail: CASI HC A03 (US Sales Only)

The clan description of multiparticle production process suggested by Giovannini and Van Hove is discussed on the base of quantum master equations for open systems. It is shown that the Poisson distribution of fragments created on the first hard stage is model independent to a great extent and can be obtained from rather general assertions of the theory of open systems. The second stage or development of the avalanche is characterized by self-organizing critical behavior. The stage of hadronization can be satisfactorily described with the help of the model of two-level sources and reminds of the laser operation under the coherent threshold. A possible cause of deviation of multiplicity distributions from the NB regularity and the hypothesis of local parton-hadron duality is also discussed. DOE

The basic formal content of field theories at non-zero temperature is presented, with application to the stability of quark-gluon plasma. Linear response theory is used to express the positions of the physical poles in the finite temperature gluon propagator in terms of the components of the proper self-energy. The formalism is then applied to the calculation at the one-loop level of the bare plasma parameters and of Landau ghosts in two classes of gauges: the covariant gauge and a one-parameter family of non covariant gauges interpolating between the static temporal gauge and the Coulomb gauge. The requirement of gauge invariance leads to searching a self-consistent expansion scheme instead of the usual loop expansion. In particular, one such scheme recently developed which incorporates all relevant higher-loop diagrams in terms of the hard thermal loops has been used to calculate the fermion damping rate in the long wavelength limit. Both a heavy and a massless fermion are considered. Ward identities between the effective propagators and vertices are used in formal proof of the gauge fixing independence of the damping rate to this order in a wide class of gauges. Finally, the gauge fixing dependence problem of the damping rate is revisited through the consideration of the exact cancellation of the infrared divergences in the two-loop photon polarization tensor.

The dispersion and diffusion relations of glueballs and mesons in the compact U(1)(2+1) model were studied. This model has been often used as a simple model of quantum chromodynamics (QCD) since it possesses the property of confinement as well as the states of glueballs. However, its mathematical structure is much more simple than QCD. The method used for studying the dispersion relations consisted in diagonalizing the Hamiltonian of that model in an appropriate base. All calculations were carried out on a 5 by 5 lattice. For diffusion, the time dependent method was employed to calculate the S matrix and the effective diffusion section of the glueballs and mesons. The various results obtained appear to be in agreement with previous work by Hakim (1981), Alessandrini et al. (1980-82), and Irving et al (1983), who used the theory of strongly coupled perturbations and worked on a space-time lattice. CISTI

The first measurement of bottom quark production in the forward detector at CDF is presented in this thesis. Events from the 1988/89 Fermilab collider run were selected with forward muons with nearby jets to form a bottom quark tag. The efficiency and acceptance of the detector are then taken into account and the number of events is turned into a cross section: sigma(p(sub t)(sup b) greater than 20 GeV, 1.9 less than the absolute value of eta(sup b) less than 2.5) = 124 +/- 35 +/- 76 nb. The contribution from direct bottom quarks is sigma(p(sub t)(sup b) greater than 20 GeV, p(sub t)(sup anti-b) greater than 15 GeV, 1.9 less than the absolute value of eta(sup b) less than 2.5) = 100 +/- 30(sub -31)(sup +30) nb. The detection of fast neutrons has been accomplished with commercially available liquid scintillators in detectors. Liquid scintillators discriminate fast neutrons from gamma radiation by discarding pulses with short decay constants. However, pulse-timing methods require expensive, bulky equipment and a high degree of technical sophistication in the user. Researchers at Pacific Northwest Laboratory have developed a new class of scintillating material, polymerizing crystals of CaF2Eu and liquid acrylate monomers with matched indexes of refraction. The new detectors avoid the pulse-timing methods of liquid detectors and allow detectors to be large and relatively light. Fast neutrons can be discriminated from gamma radiation solely on the basis of pulse height (i.e., energy deposition). Using these detectors, a hand-held neutron detection instrument is proposed that can operate on battery power for 8 to 12 hours and be easily used in field conditions for surveying vehicles and structures. A SEARCH FOR RAPIDITY GAP EVENTS IN p(BAR p) COLLISIONS AT D(0)
K. T. Streets (Maryland Univ., College Park.) Nov. 1993 4 p Presented at the International Europhysics Conference on High-energy Physics, Marseille, France, 22-28 Jul. 1993
(Contract DE-AC02-76CH-03000)
(DE94-004654; FNAL/C-93/349-E; CONF-930761-6) Avail: CASI HC A01/MF A01

Preliminary results from a search for jet events with rapidity gaps are presented. These events were produced in p(bar p) interactions at sq. root of s = 1.8 TeV and measured with the D(0) detector at Fermilab. The fraction of events with a rapidity gap is measured as a function of the pseudo-rapidity difference between the cone edges of the two leading jets ((Delta)(eta)(sub c)). An upper limit on the fraction of events with no particles between jets is measured at 0.0093 at a 90% confidence level for events with (Delta)(eta)(sub c) greater than 3 and jet transverse energies greater than 30 GeV. SCALING IN HEAVY-FERMION SYSTEMS
J. D. Thompson, Z. Fisk, and J. M. Lawrence 1993 36 p Presented at the Workshop on Cuprate and Heavy-fermion Superconductors, Cologne, Germany, 21-30 Sep. 1993
(Contract W-7405-eng-36)
(DE94-005002; LA-UR-93-4344; CONF-9309321-1) Avail: CASI HC A03/MF A01

Ambient pressure characteristics of heavy-fermion compounds, such as the ratio of the low temperature magnetic susceptibility to the electronic specific heat coefficient (gamma) and a simple relationship between the T(exp 2)-coefficient of resistivity and gamma(exp 2), suggest that a single-energy scale T(sub o) dictates the physics of these materials. Such is the case for Kondo-impurity systems to which heavy-fermions are related. We consider the consequences of assuming that the electronic free energy is given by a universal function of T/T(sub 0)(V) where V is the molar volume. We show that volume-dependent magnetic susceptibility, specific heat and electrical resistivity of some heavy-fermion compounds scale as T/T(sub 0)(V), at least over a range in pressures and temperatures. A further consequence of the principle assumption is that Gruneisen parameters defined as - (partial derivative)lnX/(partial derivative)lnV, where X is some physical property, should be identical for all properties and equal to that determined from electronic contributions to the volume-thermal expansion coefficient and specific heat. In several materials, this equality holds, at least approximately. Although evidence is found for single-energy scaling in heavy-fermion materials, we cannot conclude unambiguously that the basic assumption is correct in detail. DOE

SEARCH FOR THE TOP QUARK IN THE ELECTRON-ELECTRON AND ELECTRON-MUON CHANNELS AT D0
M. Fatyga (Brookhaven National Lab., Upton, NY.) 3 Dec. 1993 12 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-006174; FNAL/C-93/385-E; CONF-9310247-5) Avail: CASI HC A03/MF A01

We discuss preliminary results of a search for top quarks using their decays in two di-lepton, with the D0 detector at Fermilab. The present analysis has been optimized to search for a top with mass near 100(GeV/sq. c), consistent with published limits. In the event sample corresponding to an integrated luminosity of 15pb(exp -1) we observe two events passing all selection cuts. The number of events observed is consistent with the expected number of background events. Consequently, we do not claim the observation of a top decay in the present event sample. We note, however, that the kinematic properties of one of the events appear to be far removed from known backgrounds. We discuss the event and show results of the mass likelihood analysis when applied to this event. DOE

DETERMINATION OF PHOTON FLUENCE SPECTRA FROM THE NPL MOBALTRON Co-60 UNIT
D. R. Shipley and S. Duane Jan. 1994 15 p
(ISSN 0955-9655)
(NPL-RSA(EXT)-46; ETN-94-95854) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex TW11 0LW, England)

Absorbed dose to water calibrations of secondary standard hospital dosemeters are carried out in both x-radiation from 4 to 19 MV and in Co-60 gamma radiation. Measurements are performed using the primary standard graphite calorimeter and by inserting the secondary standard and working standard chambers at a reference depth in either a water or graphite phantom. Details of the dose distributions and the responses of these chambers in each phantom for the Co-60 radiation quality are, however, unknown. A knowledge of the photon fluence spectra produced by the Co-60 unit is therefore required to enable this analysis to be carried out. Work undertaken to determine the photon fluence spectra incident on the front face of the water and graphite phantoms under standard measurement conditions is described. The spectra were validated by comparing calculated tissue phantom ratios with recent experimental values. The calculated tissue phantom ratio (TPR) values were found to agree with measurements to within 1 to 2 sigma (total uncertainty), and also with independent estimates obtained using the program AVERMV. The observed discrepancies were primarily systematic in nature with the largest source of uncertainty being the change in beam quality, and hence chamber calibration factor, with depth in the phantom. A new approach to the problem of anomalous transport is developed, which is based on an understanding of the phase space topological properties of incomplete dynamical chaos of magnetic surfaces and particles. General concepts are reviewed, self-similar behavior is established for a force-free model, and the presence of super-diffusion in toroidal geometry is confirmed for appropriate conditions. Manipulation with control parameters can be effectively used to change the rate of diffusion and the characteristic exponent of the transport. As an additional example of the anomalous transport, chaotic instability induced by computer simulation is demonstrated. This is important in preparing of codes and simulation programs. DOE

The past year has been a busy one for all three accelerators: the LINAC, EBIS, and the tandem. The EBIS continues to deliver beams of highly charged ions around the clock for the study of low energy collisions with gases and surfaces. The electron beam energy was upgraded to 10 keV, and intensities of highly charged species such as Xe(44+) were greatly increased. The tandem, the traditional source of highly charged binary encounter electron production at zero degrees were studied for medium Z (Si,Cl,Cu) projectiles. Recoil momentum spectroscopy has been used to separate the contributions to collisional ionization of one-electron ions (C(5+), O(7+), F(8+)) from the nucleus and the electrons of a He target. Marked structure in the binary encounter electron spectra for Cu(sup q+) on H2 targets was measured for moderate velocity projectiles. Electron capture by slow multiply charged (EBIS) projectiles from laser excited targets has been carried out. Cross sections for capture from Na(3s) and Na*(3p) were measured for velocities between 0.1 and 1 au. The extension of these experiments to laser excited Rydberg targets is proceeding. Electron capture cross sections and average Q values for Ar(16+) on He at velocities between 0.23 and 1.67 au were measured. The charge state distribution of the He recoils following large angle scattering of C(4+) and C(6+) ions at 7.5 keV/u has been measured. Cross sections have been measured for up to sextuple capture from C60 (buckminsterfullerene) by highly charged slow projectiles. Coupled channel calculations for double capture from He by slow multicharge ions were carried out. DOE

Research in the Maryland Nuclear Theory Group focusses on problems in four basic areas of current relevance. The section on Hadrons in Nuclei reports research into the ways in which the properties of nucleons and the mesons which play a role in the nuclear force are modified in the nuclear medium. QCD sum rules supply a new insight into the decrease of the nucleon's mass in the nuclear medium. The quark condensate decreases in nuclear matter, and this is responsible for the decrease of the nucleon's mass. The section on the Structure of Hadrons reports progress in understanding the structure of the nucleon. These results cover widely different approaches: lattice gauge calculations, QCD sum rules, quark-meson models with confinement, and other hedgehog models. Progress in Relativistic Nuclear Physics is reported on electromagnetic interactions in a relativistic bound state formalism, with applications to elastic electron scattering by deuterium, and on application of a two-body quasipotential equation to calculate the spectrum of mesons formed as bound states of a quark and antiquark. A Lorentz-invariant description of the nuclear force suggests a decrease of the nucleon's mass in the nuclear medium similar to that found from QCD sum rules. Calculations of three-body bound states with simple forms of relativistic dynamics are also discussed. The section on Heavy Ion Dynamics and Related Processes describes progress on the (e(+)e(-)) problem and heavy-on dynamics. In particular, the sharp electrons observed in (beta)(+) irradiation of heavy atoms have recently been subsumed into the 'Composite Particle Scenario,' generalizing the '(e(+)e(-))-Puzzle' of the pairs from heavy ion collisions to the 'Sharp Lepton Problem.' SELF-SIMILAR VARIABLES AND THE PROBLEM OF NONLOCAL ELECTRON HEAT CONDUCTIVITY
S. I. Krasheninnikov and O. G. Bakunin Oct. 1993 31 p
(Contract DE-FG02-91ER-54109)
(DE94-005826; PFC/RR-93-4) Avail: CASI HC A03/MF A01

Self-similar solutions of the collisional electron kinetic equation are obtained for the plasmas with one and three dimensional plasma parameter inhomogeneities and arbitrary Z(sub eff). For the plasma parameter profiles characterized by the ratio of the mean free path of thermal electrons with respect to electron-electron collisions, lambda(sub T), to the scale length of electron temperature variation, L, one obtains a criterion for determining the effect that tail particles with motion of the nondiffusive type have on the electron heat conductivity. For these conditions it is shown that the use of a 'symmetrized' kinetic equation for the investigation of the strong nonlocal effect of suprathermal electrons on the electron heat conductivity is only possible at sufficiently high Z(sub eff) (Z(sub eff) greater than or equal to (L/lambda(sub T))(exp 1/2). In the case of three dimensional inhomogeneous plasma (spherical symmetry), the effect of the tail electrons on the heat transport is less pronounced since they are spread across the radius r. DOE

DISSOCIATIVE RECOMBINATION OF H3(+)
A. E. Orel (California Univ., Davis.), K. C. Kulander, and B. H. Lengsfield, III Dec. 1993 9 p Presented at the Physical Chemistry of Molecules and Grains in Space, Mount Saint-Odile, France, 6-10 Sep. 1993
(Contract W-7405-eng-48)
(DE94-005356; UCRL-JC-114022; CONF-9309317-1) Avail: CASI HC A02/MF A01

Recent experiments by Larsson et al. have confirmed the prediction of a high energy (approximately 9.5 eV) peak in cross section for dissociative recombination of H3(+). This peak is caused by four doubly excited resonance states of H3. Electron scattering calculations using the complex Kohn method provide resonance positions and widths as functions of the internuclear geometry. This information was used as input to a wave packet calculation for the dissociation dynamics on a fit to the resonant state potential energy surfaces. The resulting cross sections agree well with this experiment. DOE

NEUTRONICS OF A D-Li NEUTRON SOURCE: AN OVERVIEW
I. C. Gomes and D. L. Smith Nov. 1993 23 p Presented at the 6th International Conference on Fusion Reactor Materials, Stresa, Italy, 27 Sep. - 1 Oct. 1993 Revised
(Contract W-31-109-eng-38)
(DE94-005372; ANL/EP/CP-79739-Rev; CONF-930928-6-Rev) Avail: CASI HC A03/MF A01

The importance of having a high energy (14 MeV) neutron source for fusion materials testing is widely recognized. The availability of a test volume with easy accessibility, with a radiation environment similar to the one expected for a fusion reactor, and with dimensions large enough to accommodate several small samples or a small blanket mock-up are requirements impossible to meet with the existing reactors and irradiation facilities. A D-Li neutron source meets the above mentioned requirements and can be built today with well known technology. This paper describes some relevant topics related to beam target configuration, neutron flux spectrum, and nuclear responses for a D-Li neutron source. The target-beam configuration is analyzed for different beam cross sectional areas and trade-offs between the area of the beam and related quantities such as available volume for testing, peak fluxes, and flux or nuclear responses gradient are presented. The conclusion is that the D-Li neutron source has the necessary characteristics to be the option of choice for IFMIF. DOE

THEORY FOR ELECTRON-TRANSFER REACTIONS IN A THREE-COMPONENT SYSTEM: THE DEGENERATE REGIME
J. Tang 1994 17 p
(Contract W-31-109-eng-38)
(DE94-005919; ANL/CHM/PP-79990) Avail: CASI HC A03/MF A01

Theory for nonadiabatic electron-transfer reactions at high temperature is presented for a three-component system: a donor, an acceptor, and a bridging intermediate. Only the 'degenerate' regime of triple energy-level crossing is considered assuming three Marcus parabolas cross at the same point and the direct free energy gap vanishes. Because the ordinary second-order perturbation theory fails, the nonperturbative stochastic Liouville approach of Zusman is used in deriving analytical expressions for the superexchange and the sequential electron-transfer rate constants. DOE

CALCULATION OF INELASTIC MEAN FREE PATH AND STOPPING POWER FOR ELECTRONS IN SOLIDS FROM AN OPTICAL-DATA MODEL
J. M. Fernandez-Varea (Universidad Autonoma de Barcelona, Bellaterra, Spain.), D. Liljequist, R. Mayol, and F. Salvat Nov. 1992 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(USIP-92-06; ETN-94-95984) Avail: CASI HC A03

The numerical calculation of electron inelastic mean free path and stopping power from an optical data model recently proposed by Fernandez-Varea et al. is described. Explicit expressions for the one electron total cross sections of the two modes model of the free electron gas and the delta oscillator are derived. The inelastic mean free path and the stopping power are obtained as integrals of these one electron total cross sections weighted by the optical oscillator strength. The integrals can be easily evaluated, with a selected accuracy, by using the FORTRAN 77 subroutine GABQ described, which implements a 20 point Gauss Adaptive Bipartition Quadrature method. Source listings of FORTRAN 77 subroutines to compute the one electron total cross sections are also given. ESA

US/JAPAN COOPERATION IN HIGH ENERGY PHYSICS
16 Nov. 1993 148 p
(DE94-005376; DOE/ER-0607T) Avail: CASI HC A07/MF A02

The objective of the Implementing Arrangement was to further the energy programs of both countries by establishing a framework for cooperation in the field of high energy physics, including research, accelerator and detector instrumentation research and development, the fabrication and subsequent use of new experimental devices and facilities, and related joint efforts as may be mutually agreed. Over the years, this cooperation has been very effective and has strengthened the overall collaborative efforts and the understanding between our nations and their citizens. It has demonstrated to the world our ability to work together to attack difficult problems. High Energy Physics goes across national borders; the bond is clearly intellectual and common ground is shared for the benefit of all in a most effective manner. This review covers the activities conducted under the aegis of the US/Japan Committee for Cooperation in High Energy Physics during the past five years (1988-1993). This was the second such US review of the US/Japan cooperative activities; the first was held in 1987. DOE

THE INDUCTION APPROACH TO HEAVY ION INERTIAL FUSION: ACCELERATOR AND TARGET CONSIDERATIONS
R. O. Bangerter Aug. 1993 21 p Presented at the International Symposium on Heavy Ion Fusion, Frascati, Italy, 25-28 May 1993
(Contract DE-AC03-76SF-00098)
(DE94-005216; LBL-33798; HIFAN-577; CONF-9305136-16) Avail: CASI HC A03/MF A01

Induction acceleration is one of two principal approaches for producing ion beam for heavy-ion inertial fusion. This approach was first suggested by the late Denis Keefe of Lawrence Berkeley Laboratory and is the main approach of the U.S. heavy-ion-fusion program. Induction accelerators have the ability to handle high beam currents; therefore, accumulation rings or storage rings are not required. The target and accelerator considerations that are important for the design of induction accelerators for fusion are reviewed. These considerations, including some important assumptions, have led to a standard induction accelerator concept; however, a careful examination of the assumptions and considerations shows that many of them are not truly fundamental. Through improvements in technology, changes in design, and alternate ways of focusing beams, it appears possible to circumvent or relax the constraints imposed by the standard orthodoxy. If it is possible, it will lead to induction accelerators that are more efficient and less costly than the standard concept. DOE

ADVANTAGES OF THE LBL 88-INCH CYCLOTRON ION BEAM FOR SEP STUDIES
Rocky Koga and Steven D. Pinkerton 15 Sep. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F04701-88-C-0089)
(AD-A275142; TR-0091(6940-05)-4; SMC-TR-93-59) Avail: CASI HC A03

The Lawrence Berkeley Laboratory 88-inch cyclotron has been widely used for single-event phenomena (SEP) studies. The advantages and disadvantages of using ions at this facility are compared with those for other accelerator facilities in the U.S. One major advantage of the 88-inch cyclotron is that several ion species, with varying stopping powers, can be made available in a matter of seconds by simply adjusting the cyclotron frequency. The importance of this capability is illustrated via test results for a high-density SRAM and an EEPROM device type. DTIC

BPM901N MONITOR ELECTRONICS FOR THE DETERMINATION OF THE BUNDLE PROFILE IN THE EXTRACTION LINE OF AmPS [BPM901N MONITOR ELEKTRONICA VOOR BEPALING VAN HET BUNDELPROFIEL IN DE EXTRACTIELIJN VAN AmPS]
H. Verkooijen 24 Jun. 1993 21 p In DUTCH
(DIGEL-1993-9; ETN-94-95516) Avail: CASI HC A03/MF A01

The Bundle Profile Monitor 901N (BPM901N) was developed to determine the bundle profile of the electron bundle in the AmPS (Amsterdam Pulse Stretcher) storage ring. The extracted bundle and the outer side of the circulating bundle are measured. The current detected by the monitor is converted into a voltage and integrated during an adjustable time, such that the output signal gives the charge. The monitor electronics consists of an amplifier, an integrator, and a computer interface. The current range of the amplifier is between 1 pA and 1 microA. The integration time ranges between 10 ms and 100 ms. The charge signal is digitized and then processed by the computer. ESA

This report describes the scientific activity of the Synchrotron Radiation Laboratory of the Institute for Solid State Physics (SRL-ISSP), the University of Tokyo. The central experimental facility is SOR-RING, a 380 MeV electron storage ring with six experimental stations dedicated to synchrotron radiation science. Reports on the performance of SOR-RING and related accelerator science are also included along with the activity of the Branch Laboratory of SRL-ISSP located at the Photon Factory of the National Laboratory for High Energy Physics (PF-KEK). In 1992, active experiments were carried out on solid state spectroscopy and radiation effects on biological materials, optical absorption and reflection spectroscopy mainly for unoccupied conduction states, and photoemission, especially resonant photoemission to identify energy levels of localized electrons. Major actions were improving the monochromator slit system, replacing the electron energy analyzer with a double-stage Cylindrical Mirror Analyzer (CMA), which enables photoelectron EDC's (Energy Distribution Curve) of better quality and photoemission experiments using monochromatic light from a modified Wadsworth monochromator. STRIPLINE MONITOR ELECTRONICS FOR THE BUNDLE POSITION DETERMINATION IN AmPS [STRIPLINE MONITOR ELEKTRONICA VOOR DE BUNDELPOSITIE BEPALING BIJ AMPS]
H. Verkooijen 11 May 1993 37 p In DUTCH
(DIGEL-1993-8; ETN-94-95515) Avail: CASI HC A03/MF A01

A stripline monitor was developed to measure the current and the position of the bundle in the AmPS (Amsterdam Pulse Stretcher) storage ring. The monitor consists of four strips of a quarter wavelength (the accelerator frequency is 2856 MHz). The signals from the strips are processed by stripline monitor electronics using a converter. The electronics delivers two output signals depending on the bundle position, and a signal depending on the bundle current. The system has a 15 MHz bandwidth, allowing the detection of 20 nS position and intensity changes. ESA

OVERVIEW OF SHIELDING ANALYSES FOR THE MHTGR FROM 1986 TO 1991
J. A. Bucholz 1993 5 p Presented at the 8th International Conference on Radiation Shielding, Arlington, TX, 24-27 Apr. 1994
(Contract DE-AC05-84OR-21400)
(DE94-002448; CONF-940424-5) Avail: CASI HC A01/MF A01

This paper provides an historical overview of the shielding analyses performed at ORNL for the Modular High Temperature Gas-Cooled Reactor (MHTGR) between late 1985 and early 1992. While the present commercial MHTGR design has evolved considerably and is different in many respects from the 1988/1989 reference design discussed in this paper, the analytical techniques used to address several key areas of concern are still in use today. This paper highlights some of those areas of concern and traces the evolution of the analytical techniques used to address them over a 6 or 7 year period. DOE

PROCEEDINGS OF THE 1991 SINGLE EVENT UPSET SYMPOSIUM
1991 406 p Symposium held in Ottawa, Ontario, 30 Apr. - 2 May 1991
(DSIS-92-00652; CTN-94-61129) Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

A symposium was held to provide a forum for exchange of scientific results of research into single event upsets (SEU's). Papers were presented on SEU and latchup measurements, proton upset measurements, SEU's in various microelectronic devices, SEU research programs, space radiation, SEU-related test facilities and procedures, SEU modelling and basic physics, and detectors. For individual titles, see N94-30212 through N94-30222.

SINGLE EVENT UPSET AND LATCHUP MEASUREMENTS AT BROOKHAVEN NATIONAL LABORATORY
V. J. Sterrino *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 22 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

Single event upset (SEU) and single event latchup (SEL) tests were conducted on a large number of digital and analog devices intended for use in the Mid-course Space Experiment satellite. Seven different heavy ion beams were utilized in the tests, conducted in the Heavy Ion Test Facility at Brookhaven National Laboratory. The ions included C-12, F-19, Si-28, Ni-59, Br-80, I-127, and Au-197. The linear energy transfer (LET) for these particles ranged from 1.43 to 163.4 MEV cm squared/Mg. SEL is a phenomenon occurring when a single high-energy particle triggers the normal operating point of a device to a new stable state, where it can remain latched if the power supply supplies sufficient current. Generally, all the memory devices tested showed some latchup tendency. For devices having both epitaxial and non-epitaxial versions, the non-epitaxial version latched but the epitaxial did not, even at the highest tested LET value. All of the Motorola DSP56001 (the central processor element in the satellite's signal processor) were latchup sensitive. Those devices that showed evidence of SEL had a mean time to latchup of 2,500 to 25,000 powered days. For the DSP56001, mean time to SEU of any memory segment varied from 25 to 50 days. Memory devices showed mean time to SEU of .033 days. Implications of these results for the software and processor design are discussed. Author (CISTI)

ENERGETIC HEAVY-ION TRACKS IN MICRON SITES Abstract Only
J. F. Dicello and M. Zaider *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 1 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

As sensitive volumes increase, energy deposition patterns from energetic heavy ions (those ions heavier than He) exhibit unique and perhaps surprising characteristics. In comparison with low-energy heavy ions of the same linear energy transfer, the mean energy deposited per event in sites of micrometer dimensions can be significantly lowered by atomic interactions. Similarly, nuclear interactions, which tend to increase the mean energy deposited by protons and neutrons, actually tend to lower the energy deposited by high-energy heavy ions, such as Fe irons in the GeV range. Measurements of energy deposition patterns in plastics for energetic heavy ion beams, including microdosimetric spectra, illustrate these effects. Author (CISTI)

Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

Single event upsets (SEU) and latchup susceptibilities of complementary metal oxide semiconductor programmable gate arrays (CMOS PPGA's) were measured at the Lawrence Berkeley Laboratory 88-in. cyclotron facility with Xe (603 MeV), Cu (290 MeV), and Ar (180 MeV) ion beams. The PPGA devices tested were those which may be used in space. Most of the SEU measurements were taken with a newly constructed tester called the Bus Access Storage and Comparison System (BASACS) operating via a Macintosh II computer. When BASACS finds that an output does not match a prerecorded pattern, the state of all outputs, position in the test cycle, and other necessary information is transmitted and stored in the Macintosh. The upset rate was kept between 1 and 3 per second. After a sufficient number of errors are stored, the test is stopped and the total fluence of particles and total errors are recorded. The device power supply current was closely monitored to check for occurrence of latchup. Results of the tests are presented, indicating that some of the PPGA's are good candidates for selected space applications. Author (CISTI)

MULTIPLE SINGLE EVENT UPSETS IN CMOS STATIC RAMS Abstract Only
E. G. Stassinopoulos and G. J. Brucker *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 1 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

The occurrence of multiple upset errors during ground tests can contaminate the data and lead to error cross sections which are too high. In space, multiple errors may produce higher upsets than predicted and if they occur in single words they can defeat error detection and correction hardware. This investigation involves data which were taken during an experimental study of dose imprint effects in static memories. The results show that multiple errors occurred mainly for heavy ions with high linear energy transfers and with the majority of these in the soft upset sections of the dose-imprinted memory samples. The percentages of the total number of errors which were singles, doubles, and triplets, were determined as a function of LET, dose, and soft or hard section of the devices. The experimental observations are compared to the predictions of simple binomial statistics. Author (CISTI)

ADAPTION OF THE BUBBLE DETECTOR FOR USE AS A LET SPECTROMETER **c35**
H. Ing, R. Noulty, and T. Cousins *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 14 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

A new family of radiation detectors has been developed over the last few years whose principle is closely related to the concept of linear energy transfer (LET). These detectors, called bubble detectors, consist of a dispersion of superheated liquid droplets in an elastic medium. When radiation enters the detector, it imparts energy to a liquid droplet. If the energy exceeds a critical value, the droplet will boil and a bubble is formed. These detectors have been used in biological dosimetry, but their use for space related applications requires modifications imposed by the nature of the radiation of interest. For instance, certain heavy ions in space which pose no hazard to biological systems could still cause severe damage to electronics. The elastic medium in a biological dosimeter would shield the charged particles of low penetrability, so a new bubble detector configuration is being developed which eliminates use of the normal elastic medium. By using various types of bubble detector layers, it should be possible to measure the LET distributions appropriate for electronic components. Author (CISTI)

MCMASTER ACCELERATOR FACILITY
J. W. Stark, T. Cousins, and J. A. Davies *In its* Proceedings of the 1991 Single Event Upset Symposium 1991 3 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

The McMaster model FN tandem accelerator is useful for producing particle beams for the single event upset test facility. Ions are produced by a universal negative ion source and accelerated by potential differences toward the van de Graaff accelerator. The particles will acquire an energy equal to the potential on the high voltage terminal, where the low- and high-energy acceleration tubes are connected by an electron stripper canal. Carbon stripper foils in the canal strip the ion beam of its negative charge, producing a positive beam of particles. A gas stripper is used for heavy ions. At the end of the high energy acceleration tube, an analyzing magnet deflects the ion beam for a final mass selection. The target facility is a scattering chamber which has many benefits for single event upset operation. New additions to the target facility include a Faraday cup at the zero degree scattering chamber entrance and a multi-device automated holder that allows simultaneous installation of two devices under test (DUT), along with a surface barrier detector coaxial with the DUT. Second and third barrier detectors can be added to allow direct measurements of energy and fluence while the DUT is under bombardment. An associated facility has two evaporators used for preparing targets. Author (CISTI)

ADVANCED DEVELOPMENT OF THE SPECTRUM SCIENCES MODEL 5005-TF, SINGLE EVENT TEST FIXTURE **c35**
M. R. Ackermann, J. S. Browning, B. W. Hughlock, G. K. Lum, W. C. Tsacoyeanes, and M. D. Weeks *In its* Proceedings of the 1991 Single Event Upset Symposium 1991 12 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

A commercial application of particle identification methods commonly used in high-energy physics research has been developed for single-event testing of microelectronics. The Model 5005-TF single event test fixture can be used to substantially reduce the parts qualification testing costs for many space satellite systems. The 5005-TF includes a californium source, photomultiplier tubes, ultra thin film scintillation detectors, mountings, a vacuum chamber and related controls, and electronics for processing time-of-flight (TOF) signals. Tests were conducted to examine how well the TOF parameter identified the fission fragment (atomic number, mass, kinetic energy). For the lighter fragments, the TOF parameter has a maximum error of about 30 atomic mass units, which is inadequate for particle identification. Since light output of thin-film scintillators was known to correlate with average velocity of a fission fragment passing through the scintillator, it was decided to use the light output in conjunction with TOF to improve particle identification. This dual-parameter method was implemented in the 5005-TF and test results show favorable comparison with results from an ion beam facility. Author (CISTI)

USING Cf-252 FOR SINGLE EVENT UPSET TESTING
J. W. Howard, R. Chen, R. C. Block, M. Becker, A. G. Costantine, L. S. Smith, G. A. Soli, and M. C. Stauber *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 8 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

An improved system using Cf-252 and associated nuclear instrumentation has been used to determine single event upset (SEU) cross section versus linear energy transfer (LET) curve for several static random access memory (SRAM) devices. Through the use of a thin-film scintillator, providing energy information on each fission fragment, individual SEU's and ion energy can be associated to calculate the cross section curves. Results are presented from tests of several SRAM's over the 17-43 MeV-cm squared/mg LET range. Values obtained for SEU cross sections and LET thresholds are in good agreement with the results from accelerator testing. The equipment is described, the theory of thin-film scintillation detector response is summarized, experimental procedures are reviewed, and the test results are discussed. Author (CISTI)

CHARGE COLLECTION SPECTROSCOPY APPLIED TO MOS RAM'S
c25

P. J. McNulty, D. R. Roth, W. J. Beauvais, and W. G. Abdel-Kader *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 13 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

Pulse-height analysis of signals observed on the powerlines of metal oxide semiconductor static random access memory (MOS SRAM) devices provide useful information regarding the devices' potential sensitivity to single event upsets (SEU's) in space, including the dimensions of the sensitive volume. It is also useful to test model dependent assumptions regarding the increase in charge collection at the junction with increasing angle of incidence and the corresponding decrease in the number of particles traversing the junction. Experimental charge collection measurements were made across the powerlines of a functional device, but not while it was functioning, using the standard equipment used for pulse height spectroscopy with solid state detectors. A typical pulse-height spectrum for a MOS SRAM shows three peaks dominated by events in the memory array. Data for the peaks are consistent with the charge collected being proportional to the product of the linear energy transfer and the secant of the angle of incidence. The number of events falls off with the cosine of the angle of incidence. Author (CISTI)

PULSE HEIGHT RESPONSE OF Si SURFACE BARRIER DETECTORS
c76

D. Comedi and J. Davies *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 14 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

An extensive series of pulse height measurements was made in partially depleted 50-mm square ORTEC surface barrier detectors, using various heavy ions (Li, B, C, and Cl) at energies between 5 and 60 MeV. An Am-241 radioactive source was used for calibration purposes. By varying the angle of incidence and the detector bias, it was established that the charge collection efficiency is close to 100 percent in all cases. These angle of incidence studies also provide experimental values for the correction for the small energy loss in traversing the Au surface barrier layer. After correcting for this window loss and for the residual nuclear stopping, the resulting pulse heights per MeV for the various heavy ions were found to be up to 3 percent larger than for the Am-241 alpha particle. This increase, although significant, is considerably smaller than had been anticipated from an extrapolation of an earlier study of H, He, and Li by Lennard et al (1986). The dependence of the detector resolution on the energy and atomic number of the particle was also measured to provide a suitable data base for selecting the optimum ion beams for various backscattering analysis problems. DETERMINATION OF COSMIC RAY LATCHUP RATE IN CMOS DEVICES
c93

M. A. Shoga and E. C. Smith *In* Defence Research Establishment, Proceedings of the 1991 Single Event Upset Symposium 1991 7 p (For primary document see N94-30211 08-73)
Avail: Issuing Activity (Defence Research Establishment, Ottawa, ON K1A 0Z4 Canada)

Unlike single event upsets, an acceptable method to determine the single event latchup (SEL) rate does not exist. Such a method is very important, since SEL rates can be compared with reliability failure rates where latchup may induce failure. For complementary metal oxide semiconductor (CMOS) devices, cyclotron measurements of latchup cross section and the critical threshold are not sufficient to determine the latchup rate. A method is described for determining the latchable areas in a CMOS device. The dimensions of the sensitive volume were determined by a combination of cyclotron data and micrographic observation of delidded devices. The critical charge is determined from the linear energy transfer measurements with the cyclotron and from capacitance voltage measurements. Latchup rates were calculated using a version of the CRIER computer program. The environment assumed was that calculated from the Adams model for solar minimum, which corresponds to the maximum galactic cosmic ray flux. Mean time between latchups was found to be 11 to 4,100 years for the three devices tested. Author (CISTI)

The advanced Particle Bed Reactor (PBR) to be described in this paper is characterized by relatively low power, and low cost, while still maintaining competition values for thrust/weight, specific impulse and operating times. In order to retain competitive values for the thrust/weight ratio while reducing the reactor size, it is necessary to change the basic reactor layout, by incorporating new concepts. The new reactor design concept is termed SIRIUS (Small Lightweight Reactor Integral Propulsion System). The following modifications are proposed for the reactor design to be discussed in this paper: Pre-heater (U-235 included in Moderator); Hy-C (Hydride/De-hydride for Reactor Control); Afterburner (U-235 impregnated into Hot Frit); and Hy-S (Hydride Spike Inside Hot Frit). Each of the modifications will be briefly discussed below, with benefits, technical issues, design approach, and risk levels addressed. The paper discusses conceptual assumptions, feasibility analysis, mass estimates, and information needs. DOE

Avail: CASI HC A03/MF A01

We have studied quantum mechanical suppression of bremsstrahlung of low energy 1-500 MeV photons from high energy 25 GeV electrons. We measured the LPM effect, where multiple scattering of the radiating electron destroys coherence required for the emission of low energy photons, and the dielectric effect, where the emitted photon traveling in the radiator medium interferes with itself. For the experiment, the collaboration developed a novel method of extracting a parasitic low-intensity high-energy electron beam into the fixed target area during normal SLC operation of the accelerator. The results agree quantitatively with Migdal's calculation of the LPM effect. Surface effects, for which there is no satisfactory theoretical prediction, are visible at low photon energies. For very thin targets, the suppression disappears, as expected. Preliminary results on dielectric suppression of bremsstrahlung are in qualitative agreement with the expectation. DOE

TOPAZ 2 SYSTEM DESCRIPTION
S. S. Voss 1994 12 p Presented at the Space 1994: International Conference and Exposition on Engineering, Construction, and Operations in Space, Albuquerque, NM, 26 Feb. - 3 Mar. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-006230; LA-UR-94-4; CONF-940214-7) Avail: CASI HC A03

The TOPAZ 2 single-cell thermionic space reactor power system was designed, built, and tested by the former Soviet Union (Russia). It was purchased by the United States (U.S.) for technology transfer, testing, and the possible integration and launch with a U.S. satellite. To support the program, ground facilities consisting primarily of Russian hardware, have been built in Albuquerque, New Mexico to perform non-nuclear ground testing of the system. The purpose of this paper is to provide a brief overview of the Russian TOPAZ 2 system. DOE

THE TOPAZ 2 SPACE REACTOR RESPONSE UNDER ACCIDENT CONDITIONS
S. S. Voss 1993 10 p Presented at the International Topical Meeting on the Safety of Advanced Reactors, Pittsburgh, PA, 18-20 Apr. 1994
(Contract W-7405-eng-36)
(DE94-004998; LA-UR-93-4409; CONF-940402-2) Avail: CASI HC A02/MF A01

The TOPAZ 2 is a single-cell thermionic space reactor power system developed by the U.S.S.R. during the period of time from approximately 1969 to 1989. The TOPAZ 2 was never flight demonstrated, but the system was extensively tested on the ground. As part of the development and test program, the response of the TOPAZ 2 under accident conditions was analyzed and characterized. The U.S. TOPAZ 2 team has been working closely with the Russian specialists to understand the TOPAZ 2 system, its operational characteristics, and its response under potential accident conditions. The purpose of the technical exchange is to enable a potential launch of a TOPAZ 2 by the U.S. The information is required to integrate the system with a U.S. spacecraft and to support the safety review process. The purpose of this paper is to provide a brief overview of the system and its response under actual and postulated accident conditions. DOE

(Contract DE-FG02-85ER-53198)
(DE94-005459; DOE/ER-53198/229) Avail: CASI HC A03/MF A01

A fast and inexpensive spectrometer system has been developed to record EUV impurity spectra in a magnetic fusion research device. To simplify the vacuum system, light is passed out of the spectrometer's vacuum to the detector using a sodium-salicylate-coated fiber optic coupler. This coupler is positioned such that the focal field is nearly flat over its aperture. The system's detector is a microchannel-plate-intensified, linear, self-scanning photodiode array. The 1024-pixel array covers a bandwidth of over 80 nm and is read out once every millisecond. The readout, which is four times faster than the manufacturer's maximum rating, is fully synchronized to the experiment using a locally-designed control circuit. DOE

This program demonstrated the potential of optical techniques for superior wideband analog-to-digital (A/D) conversion. The key performance goals were a signal bandwidth of at least 1.5 GHz with precision of more than 4 bits. The approach should have potential for eventual significant extension beyond these performance levels. Signal bandwidths of more than 10 GHz, with precision of 8 bits, were long term goals. To summarize the final results, an experimental simulation of a four-channel optical analog-to-digital converter (ADC) operating at 4 GS/s with 2-GHz bandwidth was conducted. The precision obtained in the bandpass sampling mode (near 10 GHz) was 3.8 bits. For baseband signals of up to 2 GHz, the measured precision was 4.6 bits. This performance exceeded the original program goals and constitutes the best known performance obtained with an optics-based ADC approach. The optical ADC technique developed offers potential performance of 10 GHz bandwidth, 20 gigasamples/sec (GS/s) sampling rate, and precision of 6 bits or more. A secondary result from the testing was the development of a data reduction methodology that revealed a previously unreported correlation between jitter and pulse-energy fluctuations. The calculated jitter was twice as small as that derived using a commonly used power spectral density analysis that assumes no correlation between these quantities. DTIC

MODELING, ANALYSIS, AND SIMULATION OF AN OPTICAL TIME-DIVISION MULTIPLE-ACCESS NETWORK ARCHITECTURE Final Report
Michael Devetsikiotis, Quing G. Zhou, Gavin R. Cato, J. K. Townsend, and Robert M. Kolbas Nov. 1993 52 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F30602-92-C-0016)
(AD-A275847; RL-TR-93-225) Avail: CASI HC A04

An optical time-division multiple-access (OTDMA) network architecture has been proposed which has the potential of avoiding electronic processing of signals at the aggregate network bandwidth. New specifications for the optical components used in this OTDMA network architecture will be required before a practical system is realized. In this report, we present a model of the OTDMA architecture that relates parameters at the device level such as carrier mobility, physical geometry, charge trapping, and carrier-concentration to system-level performance measures such as bit error rate and noise margin. We present mathematical models of the devices in the system. These models are interconnected into a system-level Monte Carlo simulation model of the OTDMA architecture. DTIC

A NEW GUIDED WAVE LENS STRUCTURE AND ITS APPLICATION Final Report, 15 Jul. 1991 - 30 Jun. 1993
Chin C. Lee 8 Oct. 1993 15 p
(Contract MIPR-ARO-132-91)
(AD-A275541; ARO-28587.1-PH) Avail: CASI HC A03/MF A01

A low-index, lens shaped waveguide is embedded in a high-index Ga(.72)Al(.28)/Ga(.59)Al(.41)As host waveguide with an anti-reflection layer incorporated at the lens boundaries to reduce reflections. An improvement factor of 1.25 in the throughput efficiency of the lens is achieved by the inclusion of AR layer. At an f-number of 1.8 and a wavelength of 1.152 microns, a focal spot size of 2.1 microns and a sidelobe level of -13 dB were measured. The angular field of view measured in the host waveguide is 11 deg. A quadri-level photomasking technique was developed for the fabrication of the new lens structure. This technique can be applied to various integrated optics structures where reflection reduction is required between low-index and high-index waveguide regions. DTIC

ABERRATED POINT-SPREAD FUNCTIONS AND BEAM QUALITY FOR OPTICAL SYSTEMS WITH ANNULAR PUPILS M.S. Thesis
Carl F. Maes Dec. 1993 124 p
(AD-A275311; AFIT/CI/CIA-93-150) Avail: CASI HC A06/MF A02

The effect of the central obscuration of an annular pupil of an incoherent optical imaging system on its aberrated point-spread function (PSF) is discussed. A simple model is presented which approximates the aberrated PSF by an aberration-free PSF scaled by its Strehl ratio. The approximation of a PSF with rotationally symmetric aberration by an aberration-free PSF scaled by the Strehl ratio improves as the obscuration of the pupil increases. Specifically, as the obscuration approached the outer radius, the PSF of the optical systems with rotationally symmetric aberations. For the rotationally nonsymmetric aberrations of astigmatism, balanced astigmatism, and coma the aberrated PSF in its central region can also be approximated by the scaled aberration-free PSF but for large Strehl ratios. For rotationally nonsymmetric aberrations, the region or spot sizes are given for which the aberration-free encircled energy without scaling by the Strehl ratio provides better agreement with the actual aberrated encircled energy than the aberration-free encircled energy scaled by the Strehl ratio. SYNTHETIC IMAGE GENERATOR MODEL; APPLICATION OF VIEW ANGLE DEPENDENT REFLECTIVITY COMPONENTS AND PERFORMANCE EVALUATION IN THE VISIBLE REGION M.S. Thesis
Richard B. Stark Feb. 1993 68 p
(AD-A275365; AFIT/CI/CIA-93-158) Avail: CASI HC A04/MF A01

This proposal focuses on operation of the RIT Digital and Remote Sensing Lab's synthetic image generation (DIRSIG) software model within the 0.4 to 1.0 micrometer wavelength region. The approach to this study is two-fold. First, an improved method is established for modeling reflectivity effects. This will include generating the associated reflectivity database. Currently, DIRSIG permits only ideal specular or ideal diffuse behavior. In a real scene, most objects actually exhibit some mixture of specular and diffuse behavior. The proposed treatment will essentially separate the reflectance characteristics into specular and diffuse components which vary as a function of view angle. Second, the performance of DIRSIG in the visible region using the improved technique must be evaluated. This will be accomplished by collecting truth data from an actual scene and comparing it to data from a synthetically generated image of the same scene. This evaluation will also serve as a first overall assessment of the model's performance in this wavelength region. DTIC

OPTIMIZING RAY TRACING WITH VISUAL COHERENCE
Nathan Loofbourrow and Steven A. Shafer 8 Dec. 1993 20 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A275218; CMU-CS-93-209) Avail: CASI HC A03/MF A01

We present a method that directs sampling and reconstruction for image generation. This method reduces the cost of the sampling stage, allows a reconstruction of the scene to be progressively refined during the sampling process, and produces a representation of the scene that permits flexibility in the generation of images. The method employs a set of region estimators to model and evaluate the samples that are taken of the image. These models describe coherent regions of the image plane. The region estimators are used to direct the sampling process and to provide a description of the scene for reconstruction. The use of region estimators removes the dependence of the reconstruction process upon the sampling process by providing a compact and accurate representation of the sampled data. This representation permits the resolution and filter kernel to be chosen at reconstruction. An algorithm is presented to perform this reconstruction efficiently. DTIC

RECONFIGURABLE OPTICAL INTERCONNECTIONS VIA DYNAMIC COMPUTER-GENERATED HOLOGRAMS Patent Application
Hua-Kuang Liu, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) and Shaomin Zhou, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 27 Jan. 1994 26 p
(Contract NAS7-1260)
(NASA-Case-NPO-19039-1-CU; NAS 1.71:NPO-19039-1-CU; US-Patent-Appl-SN-192476) Avail: CASI HC A03/MF A01

A system is proposed for optically providing one-to-many irregular interconnections, and strength-adjustable many-to-many irregular interconnections which may be provided with strengths (weights) w(sub ij) using multiple laser beams which address multiple holograms and means for combining the beams modified by the holograms to form multiple interconnections, such as a cross-bar switching network. The optical means for interconnection is based on entering a series of complex computer-generated holograms on an electrically addressed spatial light modulator for real-time reconfigurations, thus providing flexibility for interconnection networks for largescale practical use. By employing multiple sources and holograms, the number of interconnection patterns achieved is increased greatly. NASA

OPTICAL PROPERTIES OF CADMIUM SULFIDE, ZINC SELENIDE, AND ZINC MANGANESE SELENIDE SEMICONDUCTOR FILMS Ph.D. Thesis
Rachid Dahmani 1992 203 p
Avail: Univ. Microfilms Order No. DA9315627

Optical properties of CdS, ZnSe, and (ZnMn)Se semiconductor films were investigated in the vicinity of their main absorption edge. Experimental transmission spectra of thin CdS platelets of thickness 1.2 micron were theoretically fitted using a Fabry-Perot cavity and the source of the A(sub n=1) excitonic polariton damping dispersion was identified for temperatures between 2 and 180 K. It was found that for a given temperature the damping constant Gamma(omega) is independent of frequency below the resonance frequency while it is detuning-dependent above the resonance. Below 70 K, Gamma was found to be constant below resonance due to the scattering of polaritons with defects and impurities, and increased linearly above resonance because of the scattering of polaritons with acoustical phonons. Above 70 K, the damping parameter increased exponentially both below and above resonance where it is dominated by the scattering of polaritons by optical phonons. The optical phonon and room temperature gap energies were found to be equal to 38.01 MeV and 2.451 eV, respectively. The dielectric function and the lattice misfit induced strain in ZnSe and (ZnMn)Se films grown on (001) GaAs were also investigated by room temperature spectroscopic ellipsometry. The bulk-like dielectric function of unstrained ZnSe films was first determined for energies between 1.5 and 4.5 eV. This dielectric constant was then used to study the effects of strain on the top valence band at the origin of the Brillouin zone in thin ZnSe films. It was found that because of the tetragonal deformation of the cubic lattice in the plane of the film-substrate interface the top valence band splits into light and heavy hole bands and these subbands and the spin-orbit band shift towards lower energies. The coupling between the light hole and spin-orbit band induces an additional shift and broadening of the critical points. In (ZnMn)Se films the critical thickness is smaller than that of ZnSe, and the strain becomes tensile for film thicknesses above 0.5 micron because of the difference in the thermal expansion coefficients between GaAs and (ZnMn)Se. In this case, the shift of the various bands is towards higher energies. Furthermore, the ZnSe/GaAs interface was identified as a 9 A layer of Ga2Se3. Dissert. Abstr.

AN OUTDOOR EXPOSURE TESTING PROGRAM FOR OPTICAL MATERIALS USED IN SOLAR THERMAL ELECTRIC TECHNOLOGIES
T. Wendelin and G. Jorgensen Jan. 1994 6 p Presented at the American Society of Mechanical Engineers (ASME) International Solar Energy Conference, San Francisco, CA, 27-30 Mar. 1994
(Contract DE-AC02-83CH-10093)
(DE94-000265; NREL/TP-471-5865; CONF-940326-8) Avail: CASI HC A02/MF A01

Developing low cost, durable advanced optical materials is important for making solar thermal energy technologies viable for electricity production. The objectives of a new outdoor testing program recently initiated by the National Renewable Energy Laboratory (NREL) are to determine the expected lifetimes of candidate reflector materials and demonstrate their optical durability in real-world service conditions. NREL is working with both utilities and industry in a collaborative effort to achieve these objectives. To date, simulated/accelerated exposure testing of these materials has not been correlated with actual outdoor exposure testing. Such a correlation is desirable to provide confidence in lifetime predictions based upon accelerated weathering results. This outdoor testing program will allow outdoor exposure data to be obtained for realistic environments and will establish a data base for correlating simulated/accelerated outdoor exposure data with actual outdoor exposure data. In this program, candidate reflector materials are subjected to various outdoor exposure conditions in a network of sites across the southwestern United States. Important meteorological data are continuously recorded at these sites; these data will be analyzed for possible correlations with material optical performance. Weathered samples are characterized on a regular basis using a series of optical tests. These tests provide the basis for tracking material performance and durability with exposure time in the various outdoor environments. This paper describes the outdoor testing program in more detail including meteorological monitoring capabilities and the optical tests that are performed on these materials. DOE

The application of fiber optic links and networks in safety-critical systems in the next generation of nuclear power plants, as well as in some digital upgrades in present-day plants, will mean that these links must be highly reliable and able to withstand the effect of environmental stressors present at the installation location. This paper discusses the failure modes and age-related mechanisms of fiber optic transmission components and identifies environmental stressors that could adversely affect their reliability over the long term. Some of the standards that could be used in their qualification for safety-critical applications are also discussed briefly. DOE

The dynamics of charge particle beam in a solenoid with a real distribution of magnetic field, is under consideration in this paper. In cylindrical geometry the power series expansions truncated after r(sup 3) for magnetic field component Br and Bz, is taken into account with axial field distribution B(z) either rectangular or any other type. The nonlinear equation of motion with a respect matrix formalism the chromatic and spherical aberration coefficients have been determined. The described method is realized in the code of a TRANSPORT-type program. Particle simulation, carried out with some solenoid lenses has shown full agreement with results obtained on a numerical differential method (Runge-Kutta method). Physical effects of a beam focusing and a current density distribution have been investigated. DOE

SYNCHRONIZATION OF MICROWAVE OSCILLATORS BY DIRECT OPTICAL INJECTION M.S. Thesis [SYNCHRONISATION D'OSCILLATEURS MICRO-ONDES PAR INJECTION OPTIQUE DIRECTE]
Christian Beaulieu Sep. 1993 113 p In FRENCH
(ISBN-0-315-85546-0; CTN-94-61148) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Optical methods have promise for generating a defined radiation pattern in a phased array antenna made of a plurality of small radiating elements. The technique of synchronizing microwave oscillators by direct optical injection was examined in a study of the use of field effect transistors (MESFET's) as fast photodetectors. A variable frequency microwave oscillator was designed and then synchronized by an intensity modulated optical signal. The maximum phase-following band of 5.4 MHz was measured while the reference signal was injected at the oscillator fundamental frequency of 1.7, 1.1, and 0.9 MHz respectively for the 2nd, 3rd, and 5th subharmonics. In addition, supplementary measures show that it is possible

to control the phase of the signal at the output of the oscillator over a range greater than 180 deg simply by varying the voltage at the terminals of the varactor included in the oscillator circuit. The frequency stability of the synchronized oscillator was evaluated in the time and frequency domains. At 100 kHz of the carrier, a noise to carrier ratio of -97 dBc/Hz was obtained, or an improvement of -32 dB compared to the non synchronized oscillator. CISTI

Optoelectronics and photonics hold great potential for high data-rate communication and computing. Wide use in computing applications was limited first by device technologies and now suffers due to the need for high-precision, mass-produced packaging. The use of photons as a medium of communication and control implies a unique set of packaging constraints that was not present in traditional telecommunications application. At Sandia National Laboratories, state-of-the-art optoelectronic packaging activities are increasingly being driven by microelectronic techniques that have potential for low cost and high volume manufacturing. The theoretical foundations for hybrid optics, the combination of diffractive optical elements with conventional optics (refractive and reflective elements), are discussed. The application of this theory to practical cases in several design examples, exploring also the use of computer aided optimization routines is illustrated. Particular attention is given to the correction of lens aberrations. The transfer of computer generated design information into the manufacturing of the hybrid elements is described and it is shown why the techniques such as photolithography and ion beam etching, which are already established in the semiconductor industry, may be used with excellent results. Measurement techniques appropriate to testing and characterizing the imaging performance of hybrid optic elements are described, and the results obtained by evaluating prototype samples by these techniques are presented and assessed. The material presented in the text illustrates the cross fertilization of ideas taken from existing and new fields of technology which, together with the efficient combination of resources, has logically lead to the development of hybrid optics. The future of this new optical technology, both for space and ground based applications, is both clear and promising. ESA

THE PERFORMANCE OF GLOSS METERS ON CURVING SURFACES
A. Cook and B. C. Duncan Jul. 1993 18 p
(ISSN 0959-2423)
(NPL-DMM(A)-111; ETN-94-95835) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex TW11 0LW, England)

Models for calculating the performance of gloss meters on cylindrical surfaces to correct for the geometry of the sample are presented. It is noted that although quantitative measurements of surface gloss can be made easily on flat surface using commercial gloss meters, the measurement of gloss on curved plastic mouldings is inaccurate due to the divergence of light caused by the geometrical effects. The predictions of the models are compared with the actual performance of several meters. In the appropriate orientation, no change in performance occurs from the flat surface behavior provided that the radius of curvature of the cylinder is greater than a critical value. ESA

CHARACTERIZATION OF DEFECT GEOMETRIES IN MULTILAYER OPTICAL COATINGS
R. J. Tench, R. Chow, and M. R. Kozlowski Dec. 1993 11 p Presented at the 25th Boulder Damage Symposium: Annual Symposium on Optical Materials for High-Power Lasers, Boulder, CO, 27-29 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE94-005820; UCRL-JC-114999; CONF-931054-4) Avail: CASI HC A03

Laser-induced damage in optical coatings is generally associated with micrometer-scale defects. A simple geometric model for nodule-shaped defects is commonly used to describe defects in optical coatings. No systematic study has been done, however, to prove the applicability of that model to standard optical coating deposition. Some defects are known not to have a classic nodule geometry. The present study uses atomic force microscopy (AFM) and scanning electron microscopy to characterize the topography of coating defects in a HfO2/SiO2 multilayer mirror system. Focused ion-beam cross-sectioning is then used to study the underlying defect structure. This work develops a model for defect shape such that the overall geometry of a coating defect, particularly seed size and depth, can be inferred from non-destructive evaluation measurements such as AFM. The relative mechanical stabilities of nodular defects can be deduced based on the nodule's geometry. Auger analysis showed that the seed material that causes nodular defects in HfO2/SiO2 multilayers is a hafnia oxide. Such characterization capabilities are needed for understanding the enhanced susceptibility of particular defects to laser damage and for developing improved techniques for depositing low-defect density coatings. NEW HIGH TEMPERATURE PLASMAS AND SAMPLE INTRODUCTION SYSTEMS FOR ANALYTICAL ATOMIC EMISSION AND MASS SPECTROMETRY

A. Montaser 1993 9 p

(Contract DE-FG02-93ER-14320)

(DE94-004564; DOE/ER-14320/1) Avail: CASI HC A02/MF A01

In this research, new high-temperature plasmas and new sample introduction systems are explored for rapid elemental and isotopic analysis of gases, solutions, and solids using mass spectrometry and atomic emission spectrometry. During the period January - December 1993, emphasis was placed on: analytical investigations of atmospheric-pressure helium inductively coupled plasmas (He ICP) that are suitable for atomization, excitation, and ionization of elements possessing high excitation and ionization energies; simulation and computer modeling of plasma sources to predict their structure and fundamental and analytical properties without incurring the enormous cost of experimental studies; spectroscopic imaging and diagnostic studies of high-temperature plasmas; fundamental studies of He ICP discharges and argon-nitrogen plasma by high-resolution Fourier transform spectrometry; and fundamental and analytical investigation of new, low-cost devices as sample introduction systems for atomic spectrometry and examination of new diagnostic techniques for probing aerosols. Only the most important achievements are included in this report to illustrate progress and obstacles. Detailed descriptions of the authors' investigations are outlined in the reprints and preprints that accompany this report. The technical progress expected next year is briefly described at the end of this report. DOE

PROCEEDINGS OF JAPAN-US WORKSHOP P-196 ON HIGH HEAT FLUX COMPONENTS AND PLASMA SURFACE INTERACTIONS FOR NEXT DEVICES

K. N. Wilson, ed. and T. Yamashina, ed. Mar. 1993 323 p Proceedings held in Kasuga, Japan, 17-19 Nov. 1992

(DE94-701164; NIFS-PROC-12; CONF-9211262; AD-B173696L) Avail: CASI HC A14/MF A03

The Japan-US Workshop P-196 was successfully carried out at Kyushu University, Chikushi Campus, from 17-19 Nov. The major concern was on the research and development required for the International Thermonuclear Experimental Reactor (ITER) and the Large Helical Device (LHD). Most of the discussion items were similar to that of the last workshop: PFC and PSI in the Large Device; High Heat Flux Components; Laboratory Studies; and Neutron Damage. The greatest number of presentations were concerned with the High Heat Flux Component. DOE

FLUCTUATION AND TRANSPORT REDUCTION IN A REVERSED FIELD PINCH BY INDUCTIVE POLOIDAL CURRENT DRIVE

J. S. Sarff, S. A. Hokin, H. Ji, S. C. Prager, and C. R. Sovinec Dec. 1993 15 p

(Contract DE-FG02-85ER-53198)

(DE94-005542; DOE/ER-53198/231) Avail: CASI HC A03/MF A01

An auxiliary poloidal inductive electric field applied to a reversed field pinch plasma reduces the current density gradient, slows the growth of m=1 tearing fluctuations, suppresses their associated sawteeth, and doubles the energy confinement time. Small sawteeth occur in the improved state but with m=0 precursors. By requiring a change of toroidal flux embedding the plasma, inductive poloidal current profile drive is transient, but the improvement encourages the program of RFP transport suppression using current profile control. PHOTON COUNTING SPECTROSCOPY AS DONE WITH A THOMSON SCATTERING DIAGNOSTIC

D. J. DenHartog and D. E. Ruppert Nov. 1993 48 p

(Contract DE-FG02-85ER-53198)

(DE94-005543; DOE/ER-53198/230) Avail: CASI HC A03/MF A01

The measurement and reduction of photon counting spectral data is demonstrated within the context of a Thomson scattering diagnostic. This diagnostic contains a microchannel plate (MCP) photomultiplier tube (PMT) as the photon sensing device. The MCP PMT is not an ideal photon sensor, the loss of photoelectrons at the MCP input and the broad charge pulse distribution at the output add to the uncertainty in recorded data. Computer simulations are used to demonstrate an approach to quantification of this added uncertainty and to develop an understanding of its source; the methodology may be applicable to the development of an understanding of photon detectors other than an MCP PMT. Emphasis is placed on the Poisson statistical character of the data, because the assumption that a Gaussian probability distribution is a reasonable statistical description of photon counting data is often questionable. When the count rate is low, the product of the possible number of photon counts and the probability of measurement of a single photon is usually not sufficiently large to justify Gaussian statistics. Rather, because probabilities of measurement are so low, the Poisson probability distribution best quantifies the inherent statistical fluctuations in such counting measurements. The method of maximum likelihood is applied to derive the Poisson statistics equivalent of chi(exp 2). A Poisson statistics based data fitting code is implemented using the Newton-Raphson method of multi-dimensional root finding; we also demonstrate an algorithm to estimate the uncertainties in derived quantities. NONLINEAR MAGNETOHYDRODYNAMICS

1994 12 p

(Contract DE-FG02-85ER-53194)

(DE94-005654; DOE/ER-53194/6) Avail: CASI HC A03/MF A01

Resistive MHD equilibrium, even for small resistivity, differs greatly from ideal equilibrium, as do the dynamical consequences of its instabilities. The requirement, imposed by Faraday's law, that time independent magnetic fields imply curl-free electric fields, greatly restricts the electric fields allowed inside a finite-resistivity plasma. If there is no flow and the implications of the Ohm's law are taken into account (and they need not be, for ideal equilibria), the electric field must equal the resistivity times the current density. The vanishing of the divergence of the current density then provides a partial differential equation which, together with boundary conditions, uniquely determines the scalar potential, the electric field, and the current density, for any given resistivity profile. The situation parallels closely that of driven shear flows in hydrodynamics, in that while dissipative steady states are somewhat more complex than ideal ones, there are vastly fewer of them to consider. Seen in this light, the vast majority of ideal MHD equilibria are just irrelevant, incapable of being set up in the first place. The steady state whose stability thresholds and nonlinear behavior needs to be investigated ceases to be an arbitrary ad hoc exercise dependent upon the whim of the investigator, but is determined by boundary conditions and choice of resistivity profile. ELECTRON BEAM IRRADIATION EXPERIMENTS OF MONOBLOCK DIVERTOR MOCK-UP

Kazuyoshi Satoh, Masato Akiba, Masanori Araki, Satoshi Suzuki, Kenji Yokoyama, I. Smid, A. Cardella, R. Duwe, and E. DiPietro Mar. 1993 27 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DE94-707497; JAERI-M-93-058) Avail: CASI HC A03

It is one of the key issues for ITER to develop the divertor plate. Electron beam irradiation tests were carried out on a NET divertor mock-up using JEBIS at JAERI under a collaboration between the NET team, JAERI,

and KFA Juelich. Screening tests (maximum heat flux of 23 MW/sq m) and thermal cycling tests (18 MW/sq m, 30 s, 1000 cycles) were carried out. As a result of the screening tests, the erosion caused by sublimation of C/C was observed on the surface of armor tile. No serious damage such as cracks or detachments, however, were found. As a result of the thermal cycling tests, no major damage was detected on the C/C surface. However, the cooling time constant of the divertor mock-up increased over 600 cycles. Therefore it implies that some defects would occur at the brazing interface of the divertor mock-up. DOE

EXPERIMENTAL AND ANALYTICAL STUDIES OF HIGH HEAT FLUX COMPONENTS FOR FUSION EXPERIMENTAL REACTOR
Masanori Araki Mar. 1993 142 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-707671; JAERI-M-93-073) Avail: CASI HC A07

In this report, the experimental and analytical results concerning the development of plasma facing components of ITER are described. With respect to developing high heat removal structures for the divertor plates, an externally-finned swirl tube was developed based on the results of critical heat flux (CHF) experiments on various tube structures. As the result, the burnout heat flux, which also indicates incident CHF, of 41 (+/-) 1 MW/sq m was achieved in the externally-finned swirl tube. The applicability of existing CHF correlations based on uniform heating conditions was evaluated by comparing the CHF experimental data with the smooth and the externally-finned tubes under one-sided heating condition. As the results, experimentally determined CHF data for straight tube show good agreement, for the externally-finned tube, no existing correlations are available for prediction of the CHF. With respect to the evaluation of the bonds between carbon-based material and heat sink metal, results of brazing tests were compared with the analytical results by three dimensional model with temperature-dependent thermal and mechanical properties. Analytical results showed that residual stresses from brazing can be estimated by the analytical three directional stress values instead of the equivalent stress value applied. In the analytical study on the separatrix sweeping for effectively reducing surface heat fluxes on the divertor plate, thermal response of the divertor plate was analyzed under ITER relevant heat flux conditions and has been tested. As the result, it has been demonstrated that application of the sweeping technique is very effective for improvement in the power handling capability of the divertor plate and that the divertor mock-up has withstood a large number of additional cyclic heat loads. COULOMB FIELD EFFECT ON PLASMA FOCUSING AND WAKE FIELD ACCELERATION
A. Ts. Amatuni, S. S. Elbakian, and E. V. Sekhpossian Nov. 1993 29 p Prepared for LBL
(Contract DE-AC03-76SF-00098)
(DE94-004937; LBL-34836) Avail: CASI HC A03/MF A01

It is shown that the fields generated by relativistic electron (positron) bunches moving in overdense cold plasma have two components: wake and Coulomb. The existence of the Coulomb component is caused by the absence of the Debay screening of the charge moving in plasma with the velocity greater than the thermal velocity of the plasma electrons. It is shown that at some conditions the contribution of the Coulomb component to focusing and self-focusing of the electron (positron) bunches and wake field generation could be essential. This conclusion is valid for different descriptions of cold plasma-relativistic electron bunch system. DOE

DEVELOPMENT OF LARGE AREA RF INDUCTION PLASMA FOR COST EFFECTIVE DIAMOND Quarterly Report No. 1, 20 Oct. - 20 Dec. 1993
R. A. Rudder and R. C. Hendry Oct. 1993 15 p
(Contract N00014-94-C-0030)
(AD-A275888; RTI-83U-5676) Avail: CASI HC A03/MF A01

Progress continues on the development of a large area RF induction plasma system. An early problem with a hole in the deposition pattern has been assigned to poor gas distribution. The injection port has been modified to eliminate the hole. New 30 micron films on quartz substrates were fabricated. Plasma modeling and gas modeling were initiated. A downstream process gas monitor was proven. A smaller scale system for evaluating RF power vs. rate data is under construction. Additionally, a data acquisition and process control package was identified and ordered from National Instruments. DTIC

ACTIVE ELECTRON AND ION BEAM EXPERIMENTS IN SPACE Final Report, 18 Feb. 1988 - 31 Dec. 1992
M. Ashour-Abdalla, P. L. Pritchett, and D. Schriver Feb. 1993 50 p
(Contract F19628-88-K-0011)
(AD-A275570; PL-TR-93-2112; AD-E201743) Avail: CASI HC A03/MF A01

The basic physical processes that occur during the active electron beam experiments in the ionosphere are examined using multi-dimensional particle simulations. A three-dimensional isolated-system, electrostatic model is used to establish the characteristic time scales associated with injection and to investigate the processes of spacecraft charging and the loss of coherence during beam propagation. Two-dimensional electromagnetic simulations indicate that the beam-plasma interaction leads to the formation of a current structure which acts like an antenna and emits whistler waves in a coherent manner. An ion emitter instrument which injects indium ions will be used during the Geotail and Cluster satellite missions to control the spacecraft potential to be near that of the ambient plasma. To understand the beam-plasma interaction that can occur due to the ejection of the ion beam into various regions of the Earth's magnetosphere, a linear theory study is presented to see whether particular combinations of ambient plasma parameters and ion beam emission modes exist, such that plasma instabilities may be excited. INVESTIGATION OF INTENSE XUV EMISSION OF NITROGEN-PUFF Z-PINCH WITH SMALL ENERGY INPUT
J. Raus, Ales Krejci, and V. Piffl *In its* Progress in Z-Pinch Research May 1992 p 2-7 Presented at the 9th International Conference on High-Power Particle Beams, Washington, DC, 25-29 May 1992 Sponsored by Czechoslovakian Academy of Sciences Grant Agency (For primary document see N94-29074 08-75)
(PH-23) Avail: CASI HC A02/MF A01

Light elements like nitrogen or carbon are suggested as optimum working media for small Z-pinches (several kJ energy input). It is shown that such elements can be ionized up to K-shell ionization stages not only in hot-spots, but also in the bulk plasma. The yield of nitrogen K-shell radiation (about 10 J/shot) is therefore substantially higher than that of traditionally used neon. Besides the pinch physics and radiation dynamics, such radiation could be of interest for applications in 'water window' spectral region. Author

MULTICHANNEL X RAY SPECTRAL MEASUREMENT OF HOT PLASMA EVOLUTION IN NITROGEN-PUFF Z-PINCH
Ales Krejci, J. Raus, V. Piffl, A. V. Golubev, Yu. Ya. Platonov, E. Krousky, and O. Renner *In its* Progress in Z-Pinch Research May 1992 p 8-13 Presented at the 9th International Conference on High-Power Particle Beams, Washington, DC, 25-29 May 1992 (For primary document see N94-29074 08-75)
(PH-24) Avail: CASI HC A02/MF A01

Soft x-ray emission from nitrogen plasma of gas-puff Z-pinch device (with energy input 4.3 kJ and current 160 kA) has been studied. Multilayer mirror polychromator with time-resolved registration by PIN diodes was installed and its relatively narrow spectral windows were aligned to the important parts of nitrogen spectrum between 390 and 710 eV. The Te evolution (approximately 400 eV in hot spots) was measured from a slope of recomb. continuum of He-like N. The T(sub e) of bulk plasma (approximately 100 eV) is compared with T(sub e) calculated from yields of K-shell lines. Moreover, pinhole cameras were used for better understanding the radiation phase of the pinch. Time sequences of peaks in x-ray signals corresponding to a number of bright spots on photographs, are presented. Author

X RAY EMISSION SCALING AND ENERGY BALANCE OF SMALL GAS-PUFF Z-PINCH
Ales Krejci *In its* Progress in Z-Pinch Research May 1992 p 14-20 Presented at the 19th IEEE International Conference on Plasma Science, Tampa, FL, 1-3 Jun. 1992 Sponsored by Czechoslovakian Academy of Sciences Grant Agency (For primary document see N94-29074 08-75)
Avail: CASI HC A02/MF A01

Gas-puff Z-pinch is discussed as an intensive pulsed source of soft x-rays. Measurements of total x-ray yield Y(sub T) and the yield Y(sub K) from K-shells of highly-ionized atoms of argon, neon, and nitrogen are presented. The radiation produced by small (4.3 kJ) gas-puff Z-pinch confirmed the Y(sub K) approximately equal to I(sup 4) scaling (well-known from large devices) also for pinch currents I = 120 - 200 kA. The yield Y(sub T) scales as I(exp 2). Some basic considerations about energy balance of Z-pinch as well as similarities between terawatt and gigawatt devices are expressed. Author

TRANSIENT INTERNAL PROBE Final Technical Report, 15 Sep. 1990 - 15 Oct. 1993
Thomas R. Jarboe and Arthur T. Mattick 15 Dec. 1993 58 p
(Grant AF-AFOSR-0345-90)
(AD-A275054; AFOSR-94-0022TR) Avail: CASI HC A04/MF A01

The Transient Internal Probe (TIP) diagnostic is a novel method for probing the interior of hot magnetic fusion plasmas that are inaccessible with ordinary stationary probes. A small probe of magneto-optic (Verdet) material is fired through a plasma at speeds of several km/sec, illuminated by a laser beam. The beam's polarization is rotated in the probe by the local magnetic field and retroreflection back to a polarimetry detector allows determination of the B-field profile across the diameter of a plasma at a spatial resolution of better than 1-cm and an absolute B-field resolution of a few tens of Gauss. The principal components of a TIP diagnostic system were developed and tested. A two-stage light gas gun was constructed that accelerates 30-caliber projectiles to 3 km/sec, and methods were examined for stripping a lexan sabot from a probe prior to entry into a plasma. Probes of CdMnTe and FR-5 Verdet glass were fabricated, and a polarimetry system was constructed for resolving polarization to within 0.25 deg. The diagnostic was validated by measuring a static B-field with a moving (dropped) TIP probe, and finding agreement with Hall-probe measurements to within experimental accuracy (40 Gauss). DTIC

(NIFS-267) Avail: CASI HC A03/MF A01

Radial particle transport has been experimentally studied in the low-aspect-ratio heliotron/torsatron device, CHS. A non-diffusive outward particle flow (inverse pinch) is observed in the magnetic configuration with the magnetic axis shifter inward. This change in the direction of anomalous particle flow is not due to the reversal of temperature gradient nor the radial electric field. The observation suggests that the particle pinch velocity is sensitive to the magnetic field structure. Author

FORMATION AND SELF-HEALING OF MAGNETIC ISLANDS IN FINITE-BETA HELIAS EQUILIBRIA
T. Hayashi, T. Sato, P. Merkel, J. Nuehrenberg, and U. Schwenn Jan. 1994 23 p Submitted for publication
(ISSN 0915-633X)
(NIFS-269) Avail: CASI HC A03/MF A01

The behavior of finite pressure induced magnetic islands is numerically analyzed for three dimensional magnetohydrodynamic equilibria of the Helias configuration by using a three dimensional equilibrium code. It is found that an island chain is generated on the 5/6 rational surface, when such a

surface appears in the plasma region of the finite-beta equilibrium. The island chain, however, is not so dangerous as to destroy the plasma confinement even if it appears in a vanishingly small shear region. Thus, a high beta equilibrium with clear magnetic surfaces can be realized. Moreover, it is definitely confirmed that the finite pressure effect sometimes exhibits an unexpectedly good aspect, namely, that the vacuum islands are removed as beta increases, which can be called 'self-healing' of islands. This property can be explained by the numerically discovered fact that the phases of islands induced by the finite pressure effect are always locked in the same phase regardless of beta. EFFICIENCIES OF THE ICRF MINORITY HEATING IN THE CHS AND LHD PLASMAS
S. Murakami, M. Okamoto, N. Nakajima, and T. Mutoh Jan. 1994 26 p
(ISSN 0915-633X)
(NIFS-270) Avail: CASI HC A03/MF A01

ICRF minority heatings are investigated in the plasmas of the Compact Helical System (CHS) and the Large Helical Device (LHD) by means of the orbit following Monte Carlo simulation. It is found that the heating efficiency decreases with increase in the absorption power by minority ions and depends strongly on the magnetic field strength and the field configuration. Author

LIQUID METAL MHD AND HEAT TRANSFER IN A TOKAMAK BLANKET SLOTTED COOLANT CHANNEL
C. B. Reed, T. Q. Hua, D. B. Black, I. R. Kirillov, S. I. Sidorenkov, A. M. Shapiro, and I. A. Evtushenko 1993 10 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract W-31-109-eng-38)
(DE94-004622; ANL/EP/CP-79904; CONF-931018-73) Avail: CASI HC A02/MF A01

A liquid metal MHD (Magnetohydrodynamic)/heat transfer test was conducted at the ALEX (Argonne Liquid Metal Experiment) facility of ANL (Argonne National Laboratory), jointly between ANL and NIIEFA (Efremov Institute). The test section was a rectangular slotted channel geometry (meaning the channel has a high aspect ratio, in this case 10:1, and the long side is parallel to the applied magnetic field). Isothermal and heat transfer data were collected. A heat flux of approximately 9 W/sq cm was applied to the top horizontal surface (the long side) of the test section. Hartmann Numbers to 1050 (2 Tesla), interaction parameters to 9 x 10(exp 3), Peclet numbers of 10-200, based on the half-width of the small dimension (7 mm), and velocities of 1-75 cm/sec. were achieved. The working fluid was NaK (sodium potassium eutectic). All four interior walls were bare, 300-series stainless steel, conducting walls. DOE

LARGE AMPLITUDE LANGMUIR AND ION-ACOUSTIC WAVES IN A RELATIVISTIC TWO-FLUID PLASMA
Y. Nejoh (Hachinohe Inst. of Tech., Japan.) and H. Sanuki Feb. 1994 69 p Submitted for publication
(ISSN 0915-633X)
(NIFS-271) Avail: CASI HC A04/MF A01

Large amplitude Langmuir and ion-acoustic waves in a relativistic two-fluid plasma are analyzed by the pseudo-potential method. The existence conditions for relativistic nonlinear Langmuir waves depend on the relativistic effect, the particular energy, and the ion mass to electron mass ratio. The allowable range of the normalized potential depends on the relativistic effect. It is shown that the Mach number has the significant effect for the formation of relativistic nonlinear ion-acoustic waves rather than the ratio of the ion-acoustic velocity to the velocity of light. The allowable range of the normalized potential depends on the Mach number. The present investigation predicts new findings of relativistic nonlinear Langmuir and ion-acoustic waves in plasmas in which high-speed electrons and ions coexist. Author (revised)

NONLINEAR WAVE PACKET EVOLUTION IN A DISPERSIVE PLASMA: APPLICATION TO ROTATIONAL DISCONTINUITIES Ph.D. Thesis
Bernard John Vasquez 1992 228 p
Avail: Univ. Microfilms Order No. DA9315737

This dissertation examines low frequency (approximately less than ion gyrofrequency) wave packets and rotational discontinuities (RD's) in a dispersive two-fluid plasma. A one dimensional numerical hybrid code with ion simulation particles and a massless electron fluid is used. The evolution, speed, and structure of strongly modulated wave packets, which propagate parallel to an external magnetic field, are investigated as a function of helicity, amplitude, beta(defined equal to 8 pi P/B(exp 2)), and beta(sub i)/beta(sub e) (= T(sub i)/T(sub e)). Gradients of the wave envelope are found to have a substantial influence on wave speeds and other properties. Weakly nonlinear packets show wave coupling with structuring that qualitatively resembles wave solutions of the derivative nonlinear Schrodinger (DNLS) equation for all beta and beta(sub i)/beta(sub e). Nonlinearity has its greatest impact on evolution when the initial packet speed and the linear sound speed of the plasma are equal. Strongly nonlinear Alfven (ion sense of helicity) wave packets do not undergo wave collapse, but do steepen for beta approximately less than 1 and form substantial fast (electron sense of helicity) wave regions on their leading sides. This evolution is shown to differ qualitatively from DNLS wave solutions. An extensive parameter variation on the evolution of RDs is perfromed with particular emphasis on beta, beta(sub i)/beta(sub e), theta(sub B) (the angle between the normal and total magnetic field), and the helicity of the RD. The RD structure is shown to have features in common with the evolution of both strongly modulated, nonlinear wave packets and linear dispersive wave propagation in oblique magnetic fields. For moderate theta(sub B) (approximately less than 45 deg), nonlinearity is important and strong coupling to a compressional (sonic) component can occur in the main current layer. When beta(sub i) = 0, there is a critical value of beta(sub e)(=beta(sub *)) when the intermediate wavetrain moves from the downstream side of the RD to the upstream, and is replaced on the downstream side by slow modes. This is reflected in the hodograms by a change of the wave polarization on both sides. As beta(sub i)/beta(sub e) increases, the spreading rate of the current layer increases for moderate theta(sub B). For large theta(sub B) (approximately greater than 45 deg), RDs with electron (ion) sense of rotation show increased (decreased) spreading with increasing beta(sub i)/beta(sub e). These results are applied to RDs observed in the solar wind and at the magnetopause.

In this thesis the fundamental concepts of moderately coupled plasmas, for which 2 approximately less than ln(lambda(sub b) approximately less than 10, are, for the first time, presented. This investigation is motivated because neither the conventional Fokker-Planck approximation (for weakly coupled plasmas (ln(lambda)(sub b) approximately less than 10) nor the theory of dielectric response with correlations for strongly coupled plasmas (ln(lambda)(sub b) approximately less than 1) has satisfactorily addressed this regime. Specifically, the standard Fokker-Planck operator for Coulomb collisions has been modified to include neglected terms that are directly associated with large-angle scattering. In addition, a reduced electron-ion collision operator has been calculated that, for the first time, manifests 1/ln(lambda)(sub b) corrections. Precise calculations of some relaxation rates and crude calculations of electron transport coefficients have been made. As one of major applications of the modified Fokker-Planck equation, the stopping powers and (rho)R have been calculated for charged fusion products (alpha's, H-3, He-3) and hot electrons interacting with plasmas

relevant to inertial confinement fusion. In the second major topic of this thesis, advances made in the area of laboratory x-ray sources are presented. First, and most importantly, through the use a Cockcroft-Walton linear accelerator, a charged particle induced x-ray emission (PIXE) source has been developed. Intense line x radiation (including K-, L-, M-, and N-lines) with wavelengths from 0.5 A to 111 A have been successfully produced. Second, a new high intensity electron-beam x-ray generator has also been developed, and it has been used with advantage in the soft x-ray region (less than 3 keV). Finally, a direct comparisons of both sources (PIXE and electron-beam x-ray sources) to a commercially available radioactive (alpha) fluorescent x-ray source has been made. DOE

Over two years of data from the Lockheed Plasma Composition Experiment on the ISEE 1 spacecraft, covering ion energies between 100 eV/e and about 16 keV/e, have been analyzed in an attempt to extract new information about three geophysical issues: (1) solar wind penetration of the Earth's magnetic tail; (2) relationship between plasma sheet and tail lobe ion composition; and (3) possible effects of heavy terrestrial ions on plasma sheet stability. For individual titles, see N94-30127 through N94-30128.

TAIL LOBE ION COMPOSITION AT ENERGIES OF 0.1 TO 16 keV/e: EVIDENCE FOR MASS-DEPENDENT DENSITY GRADIENTS
O. W. Lennartsson *In its* A Study of the Formation and Dynamics of the Earth's Plasma Sheet Using Ion Composition Data 20 Apr. 1994 15 p Repr. from Journal of Geophysical Research, v. 99, no. A2, 1 Feb. 1994 p 2387-2401 (For primary document see N94-30126 08-75)
(Contract NAS5-33047) (ISSN 0148-0227)
(Paper-93JA03201) Copyright Avail: CASI HC A03/MF A01

A large set of energetic (0.1 to 16 keV/e) ion composition data from the central magnetotail, obtained by the ISEE 1 spacecraft between 10 and 23R(sub E) from Earth, is sorted according to measured total ion beta value, in order to investigate whether bulk properties of different ions vary in different ways between plasma sheets and lobes, as suggested by a comparison of certain experimental and theoretical results in the literature. Despite inevitable difficulties with extracting statistically valid data at very low beta (10(exp -2) or lower), the results seem to support a recent theoretical model suggesting that lighter ions have a steeper density gradient than heavier ions, especially when comparing H(+) ions with O(+) ions. The results also indicate that ion velocity distributions are fairly isotropic even at low beta, at least those of H(+) ions, although field-aligned flows are common. The results are evaluated in the context of plasma transport and are found to lend some support to the notion that tail lobe convection may be directed inward from the dawn and dusk flanks. EXPERIMENTAL INVESTIGATION OF POSSIBLE GEOMAGNETIC FEEDBACK FROM ENERGETIC (0.1 TO 16 keV) TERRESTRIAL O(+) IONS IN THE MAGNETOTAIL CURRENT SHEET
O. W. Lennartsson, D. M. Klumpar, E. G. Shelley, and J. M. Quinn *In its* A Study of the Formation and Dynamics of the Earth's Plasma Sheet Using Ion Composition Data 20 Apr. 1994 12 p Repr. from Journal of Geophysical Research, v. 98, no. A11, 1 Nov. 1993 p 19443-19454 (For primary document see N94-30126 08-75)
(Contracts NAS5-30565; NAS5-33047) (ISSN 0148-0227)

Data from energetic ion mass spectrometers on the ISEE 1 and AMPTE/CCE spacecraft are combined with geomagnetic and solar indices to investigate, in a statistical fashion, whether energized O(+) ions of terrestrial origin constitute a source of feedback which triggers or amplifies geomagnetic activity as has been suggested in the literature, by contributing a destabilizing mass increase in the magnetotail current sheet. The ISEE 1 data (0.1-16 keV/e) provide in situ observations of the O(+) concentration in the central plasma sheet, inside of 23 R(sub E), during the rising and maximum phases of solar cycle 21, as well as inner magnetosphere data from same period. The CCE data (0.1-17 keV/e) taken during the subsequent solar minimum all within 9 R(sub E). provide a reference for long-term variations in the magnetosphere O(+) content. Statistical correlations between the ion data and the indices, and between different indices. all point in the same direction: there is probably no feedback specific to the O(+) ions, in spite of the fact that they often contribute most of the ion mass density in the tail current sheet. HIGHER ORDER COLLISIONLESS BALLOONING MODE IN TOKAMAKS
A. Hirose and L. Zhang Feb. 1994 12 p
(PPL-143; CTN-94-61140) Avail: CASI HC A03/MF A01

Kinetic stability analysis of general electromagnetic modes in tokamaks has revealed the existence of a higher order ballooning mode which is not subject to second stabilization. This collisionless mode is characterized by broad eigenfunctions in the ballooning space. The first stability boundary revealed from the kinetic analysis is significantly smaller than predicted from the ideal magneto hydrodynamic analysis. In particular, at large shear, the threshold for electromagnetic modes vanishes, and the modes are expected to be unstable in the region well below the ideal magneto hydrodynamic limit. The ion temperature gradient provides the dominant destabilization mechanism. Author (CISTI)

PLASMA TURBULENT BREMSSTRAHLUNG
Osamu Ishihara and Akira Hirose Feb. 1994 9 p
(PPL-144; CTN-94-61141) Avail: CASI HC A02/MF A01

Turbulent bremsstrahlung is a radiation mechanism of high frequency plasma modes produced by the scattered electrons due to the effective turbulent collisions associated with low frequency fluctuations. The mechanism of turbulent bremsstrahlung is examined, taking into account quasilinear effects. A collisionless, unmagnetized plasma is considered in which low frequency ion acoustic fluctuations are excited by, for example, current driven instability. A simple dispersion relation for the ion acoustic mode is assumed, and a test Langmuir wave is launched in the model analysis. It is shown that if the spontaneous emission term is retained in the quasilinear evolution of the distribution function, the test Langmuir waves become unstable in the presence of ion acoustic turbulence. Electrons resonating with ion acoustic waves are scattered by the low frequency fluctuations and emit Langmuir waves. The upconversion of the low frequency ion acoustic modes to high frequency Langmuir modes may occur in a collisionless plasma even when the system is closed. The proposed theory of turbulent bremsstrahlung seems to explain various plasma phenomena both in the laboratory and in space, such as the generation of long wavelength Langmuir waves by low frequency magnetospheric turbulence and the pulsed acceleration of electrons in solar flares. EIGENMODE ANALYSIS OF THE DESTABILIZED ION ACOUSTIC MODE

IN TOKAMAKS

A. Hirose and L. Zhang Jan. 1994 12 p
(PPL-142; CTN-94-61142) Avail: CASI HC A03/MF A01

Ballooning eigenmode analysis is presented of the destabilized ion acoustic mode (or long wavelength drift mode) in tokamaks. Destabilization of the ion acoustic transit mode previously predicted within local or semi-local approximation has been confirmed. The eigenfunction resembles the trial function used in the semi-local analysis and thus supports the eigenvalues obtained from the same approximation. The absence of ion Landau damping prevails, particularly in the long wavelength region. Author (CISTI)

BETA ENHANCEMENT OF THERMAL DIFFUSIVITY IN TOKAMAKS

A. Hirose and A. I. Smolyakov Aug. 1993 12 p
(PPL-141; CTN-94-61143) Avail: CASI HC A03/MF A01

Electromagnetic corrections to the quasilinear anomalous thermal diffusivity due to long wavelength electrostatic modes in tokamaks are investigated in terms of the semi-local kinetic dispersion relation. The diffusivity increases with beta (the ratio of plasma to magnetic pressure) almost linearly, even though the dispersion relation and thus the field polarization remain predominantly electrostatic. The enhancement in thermal conduction is largely due to resonant interaction of untrapped electrons with a fluctuating magnetic field. Author (CISTI)

RESISTIVE BALLOONING MODE IN A GAS-DYNAMIC TRAP

Yu. A. Tsidulko 1992 22 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608328; IYaF-92-10) Avail: CASI HC A03 (US Sales Only)

MGD instability (resistive ballooning mode) is considered, which is developed in a gas-dynamic trap due to: plasma finite conductivity. The consideration is carried out with the account for resonance effects. Two varieties of the resistive ballooning mode (fast and slow) are determined. The first one appears only in the case when the plasma conductivity in the mirror range is less some threshold value. The slow resistive mode has a positive increment at any high conductivity. A qualitative comparison with experimental data is fulfilled. DOE

LANGMUIR WAVES IN THE ELECTRON-POSITRON PLASMA

N. S. Buchelnikova and E. P. Matochkin 1992 31 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608330; IYaF-92-27) Avail: CASI HC A03 (US Sales Only)

The numerical experiments (PIC-method) were made to study the evolution of the travelling Langmuir waves in the one-dimensional nonrelativistic electron-positron plasma. If the initial wave amplitudes are not high the main process is the selfconversion of the wave. This process leads to the generation of the modes and to the development of the modulational instability as a secondary process. The damping of the electric field is due to the trapping of the electrons and positrons and to the development of the large-scale stochasticity. If the initial wave amplitudes are high the essential role plays the electron and positron nonlinearity and the trapping of the electrons and positrons by the main wave ('kinetic' effect) and the steapening and the breaking of the wave ('hydrodynamic' effect). The electron-positron plasma can be considered as a model of the equal mass positive and negative ions plasma. DOE

MAGNETIC FIELD GENERATION BY CIRCULARLY POLARIZED LASER LIGHT AND INERTIAL PLASMA CONFINEMENT IN A MINIATURE MAGNETIC BOTTLE INDUCED BY CIRCULARLY POLARIZED LASER LIGHT Ph.D. Thesis

E. Kolka Jul. 1993 71 p In HEBREW Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608353; IA-1480) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

A new concept of hot plasma confinement in a miniature magnetic bottle induced by circularly polarized laser light is suggested in this work. Magnetic fields generated by circularly polarized laser light may be of the order of a megagauss. In this configuration, the circularly polarized laser light is used to get confinement of a plasma contained in a good conductor vessel. The poloidal magnetic field induced by the circularly polarized laser and the efficiency of laser absorption by the plasma are calculated in this work. The confinement in this scheme is supported by the magnetic forces and the Lawson criterion for a DT plasma might be achieved for number density n = 5*10(exp 21)cm(exp -3) and confinement time tau = 20 nsec. The laser and the plasma parameters required to get an energetic gain are calculated. DOE

EXPERIMENTS ON THE TWO-STAGE DENSE PLASMA HEATING ON THE GOL-3 DEVICE

A. V. Burdakov, S. G. Voropaev, and A. F. Guber et al 1992 56 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608356; IYaF-92-12) Avail: CASI HC A04 (US Sales Only)

The experimental results on heating of a dense plasma by electron beam (1 MeV, 40 kA, 4 micro-sec) on the GOL-3 device are presented. The relativistic electron beam is injected into a (7-meter long plasma column of a mirror machine). The beam deposits about 20-30% of its energy into 'hot' (1-10 keV) plasma electrons in the homogeneous part of plasma (n - 10(exp 15) cm(exp -3), T approximately = 1 keV). These electrons are slowed down in a 0.5-3 meter long gas cloud of a density of 10(exp 16)-10(exp 17)cm(exp -3) (so-called two-stage heating scheme). The 'hot' electrons ionize the cloud, create a plasma which is heated due to binary collisions. The resulting total energy of the cloud is 2-4 times greater than the instantaneous energy content of the lower density homogeneous plasma. The shock waves were observed in the plasma. Temperature distribution along the plasma cloud was measured and was used to estimate the average energy of 'hot' electrons. The experiment demonstrates a high efficiency of the two-stage scheme of a dense plasma heating. DOE

PECULIARITIES OF HEAT TRANSFER IN THE EXPERIMENTS OF BEAM INJECTION HEATING OF A PLASMA AT THE GOL-3 DEVICE

A. V. Burdakov and V. V. Postupaev 1992 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608357; IYaF-92-9) Avail: CASI HC A03 (US Sales Only)

The dynamics is discussed of the heat redistribution in plasma, heated by microsecond relativistic electron beam in the GOL-3 facility. The electron temperature dependence on time and distance up to beam injection point are compared with heat transfer calculations. At the stage of plasma cooling, the time dependence of the plasma temperature is well described by the classical electron heat conduction on the facility buttends. At the same time, the dynamics of the observed electron temperature increase and its distribution in the facility length during beam injection time can not be explained by the classical electron heat conduction. DOE

IRRADIATION-INDUCED STRUCTURE AND PROPERTY CHANGES IN TOKAMAK PLASMA-FACING, CARBON-CARBON COMPOSITES

T. D. Burchell 1994 14 p Presented at the 39th International Symposium of the Society for the Advancement of Material and Process Engineering and Exhibition, Anaheim, CA, 11-14 Apr. 1994
(Contract DE-AC05-84OR-21400)
(DE94-006046; CONF-940412-3) Avail: CASI HC A03/MF A01

Carbon-carbon composites are an attractive choice for fusion reactor plasma-facing components because of their low atomic number, superior thermal shock resistance, and low neutron activation. Next generation plasma fusion reactors, such as the International Thermonuclear Experimental

Reactor (ITER), will require advanced carbon-carbon composite materials possessing high thermal conductivity to manage the anticipated severe heat loads. Moreover, ignition machines such as ITER will produce large neutron fluxes. Consequently, the influence of neutron damage on the structure and properties of carbon-carbon composite materials must be evaluated. Data from two irradiation experiments are reported and discussed here. Carbon-carbon composite materials were irradiated in target capsules in the High Flux Isotope Reactor (HFIR) at Oak Ridge National Laboratory (ORNL). A peak damage dose of 4.7 displacements per atom (dpa) at 600 C was attained. The carbon materials irradiated included unidirectional, two-directional, and three-directional carbon-carbon composites. Dimensional changes are reported for the composite materials and are related to single crystal dimensional changes through fiber and composite structural models. Moreover, the irradiation-induced dimensional changes are reported and discussed in terms of their architecture, fiber type, and graphitization temperature. The effect of neutron irradiation on thermal conductivity of two three-directional, carbon-carbon composites is reported and the recovery of thermal conductivity due to thermal annealing is discussed. DOE

A REVIEW OF THE ABLATIVE STABILIZATION OF THE RAYLEIGH-TAYLOR INSTABILITY IN REGIMES RELEVANT TO ICF
J. D. Kilkenny, S. G. Glendinning, S. W. Haan, B. A. Hammel, J. D. Lindl, D. Munro, B. A. Remington, S. V. Weber, J. P. Knauer, and C. P. Verdon Dec. 1993 34 p Presented at the Fall Meeting of the Plasma Physics Division of the American Physical Society, St. Louis, MO, 1-5 Nov. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE94-005809; UCRL-JC-115537; CONF-931132-1) Avail: CASI HC A03

It has been recognized for many years that the most significant limitation of ICF is the Rayleigh-Taylor (R-T) instability. It limits the distance an ablatively driven shell can be moved to several times its initial thickness. Fortunately material flow through the unstable region at velocity v(sub A) reduces the growth rate to the square root of (kg/1+kL) minus (beta)kv(sub A) with (beta) from 2-3. In recent years experiments using both x-ray drive and smoothed laser drive to accelerate foils have confirmed our understanding of the R-T instability. The growth of small initial modulations on the foils is measured for growth factors up to 60 for direct drive and 80 for indirect drive. For x-ray drive large stabilization is evident. After some growth, the instability enters the non-linear phase when mode coupling and saturation are also seen and compare well with modeling. Normalized growth rates for direct drive are measured to be higher, but strategies for reduction by raising the isentrope are being investigated. For direct drive, high spatial frequencies are imprinted from the laser beam and amplified by the R-T instability. Modeling shows an understanding of this laser imprinting. DOE

MODELLING EROSION DAMAGE FROM LOW-ENERGY PLASMA GUN SIMULATIONS OF DISRUPTIONS
D. A. Ehst and A. Hassanein Oct. 1993 41 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-31-109-eng-38)
(DE94-005196; ANL/FPP/TM-268) Avail: Issuing Activity (Department of Energy (DOE))

Energy transfer to material surfaces is dominated by photon radiation through low temperature plasma vapors if tokamak disruptions are due to low kinetic energy particles (approximately less than 100 eV). Simple models of radiation transport are derived and incorporated into a fast-running computer routine to model this process. The results of simulations are in good agreement with plasma gun erosion tests on several metal targets. DOE

We have performed quantum molecular dynamics simulations of hot, dense plasmas of hydrogen over a range of temperatures (0.1 to 5 eV) and densities (0.0625 to 5 g/cc). We determine the forces quantum mechanically from density functional, extended Huckel, and tight binding techniques and move the nuclei according to the classical equations of motion. We determine pair-correlation functions, diffusion coefficients, and electrical conductivities. We find that many-body effects predominate in this regime. We begin to obtain agreement with the OCP and Thomas-Fermi models only at the higher temperatures and densities. DOE

(DE94-005150; DOE/ER-53281/T3) Avail: CASI HC A03/MF A01

This paper describes progress in the following six areas: unified description of radiative and dielectronic recombination; calculations of specific dielectronic satellite transitions; modeling of K(sub alpha) dielectronic satellite spectra; effects of electron collisions and electric fields; density-sensitive dielectronic satellite lines; and polarization of atomic radiative emission in crossed electric and magnetic fields. Also discussed are proposed investigations and coordination with current tokamak observations. DOE

THE IMPACT OF IMPROVED PHYSICS ON COMMERCIAL TOKAMAK REACTORS
J. D. Galambos, L. J. Perkins, S. Haney, and J. Mandrekas Jan. 1994 51 p
(Contract DE-AC05-84OR-21400)
(DE94-006103; ORNL/TM-12483) Avail: CASI HC A04/MF A01

Improvements in the confinement and beta capability of tokamak devices have long been a goal of the fusion program. We examine the impact of improvements in present day confinement and beta capabilities on commercial tokamak reactors. We characterize confinement with the achievable enhancement factor (H) over the ITER89 Power scaling confinement time and beta by the Troyon coefficient g. A surprisingly narrow range of plasma confinement and beta are found to be useful in minimizing the cost of electricity for a tokamak reactor. Improvements in only one of these quantities is not useful beyond some point, without accompanying improvements in the other. For the plasma beta limited by a Troyon coefficient (g) near 4.3 (%mT/MA), confinement levels characterized by H factor enhancements of only 2 are useful for our nominal steady-state driven tokamak. These confinement levels are similar to those observed in present day experiments. If the permissible Troyon beta coefficient is near 6, the useful H factor confinement range increases to 2.5, still close to present day confinement levels. Inductively driven, pulsed reactors have somewhat increased useful ranges of confinement, relative to the steady-state cases. For a Troyon beta limit coefficient g near 4.3, H factors up to 2.5 are useful, and for g near 6, H factors up to 3 are useful. DOE

ADVANCED STEADY-STATE OPERATING SCENARIOS
W. M. Nevins, R. H. Bulmer, L. D. Pearlstein, S. W. Haney, and J. Manickam 2 Dec. 1993 8 p
(Contract W-7405-eng-48)
(DE94-004810; UCRL-ID-115904) Avail: CASI HC A02/MF A01

The goal for advanced steady-state operation in ITER should be to demonstrate the operation of the plasma core for a steady-state fusion reactor. To accomplish this the authors must develop steady-state operating scenarios at high beta for high fusion power density, low auxiliary power requirements (Q(sub CD) greater than or = 25, where Q(sub CD) congruent to P fusion/P(sub CD) and P(sub DC) is the power required for sustaining the plasma current) for low recirculating power requirements, and at moderate safety factor (q(sub psi)) less than or = 4.5) to minimize the cost for the tokamak core of a steady-state demonstration power reactor based on the operating modes demonstrated in ITER. The key to achieving steady-state operation at high fusion power in ITER will be the development of operating scenarios with very high bootstrap current fractions (f(sub BS) greater than or = 90%) in which the radial profile of the bootstrap current density is well aligned with that of the total plasma current density, and for which

the MHD beta-limit exceeds beta(sub n)(sup *) = 0.05 T - m/MA. They are in the process of developing such operating modes for ITER. In section 1, they propose two advanced steady-state operating points: a preliminary operating point that was the basis for the MHD studies reported in section 2, and a second operating point that has been optimized based on the authors studies to date. In section 2 they present calculations indicating that the initial operating point is stable to MHD ballooning and low-n kink modes (with a conducting wall at r = 1.25a) up to beta(sub n)(sup *) approximately = 6 x 10(exp -2) T - m/MA. In section 3, they present a free-boundary MHD equilibrium, and show that advanced steady-state operating modes are compatible with the ITER poloidal field system and diverter. DOE

APPLICATION OF DIVERTOR CRYOPUMPING TO H-MODE DENSITY CONTROL IN DIII-D
M. A. Mahdavi, J. R. Ferron, A. W. Hyatt, R. J. LaHaye, G. L. Laughon, M. Leh, R. Maingi, M. M. Menon, P. K. Mioduszewski, and K. M. Schuabel et al Nov. 1993 7 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contracts DE-AC03-89ER-51114; DE-AC05-84OR-21400)
(DE94-004859; GA-A-21501; CONF-931018-75) Avail: CASI HC A02/MF A01

In this paper, we describe the method and the results of experiments where a unique in-vessel cryopump-baffle system was used to control density of H-mode plasmas. We were able to independently regulate current and density of ELMing H-mode plasmas, each over a range of factor two, and measure the H-mode confinement scaling with plasma density and current. With a modest pumping speed of approximately 40 kl/s, particle exhaust rates as high as 2 x 10(exp 22) atom/s(exp -1) have been observed. DOE

MAGNETIC FLUX RECONSTRUCTION METHODS FOR SHAPED TOKAMAKS Ph.D. Thesis
Chi-Wa Tsui Dec. 1993 173 p
(Contract DE-AC02-78ET-51013)
(DE94-005827; PFC/RR-93-05; DOE/ET-51013/304) Avail: CASI HC A08/MF A02

The use of a variational method permits the Grad-Shafranov (GS) equation to be solved by reducing the problem of solving the two dimensional nonlinear partial differential equation to the problem of minimizing a function of several variables. This high speed algorithm approximately solves the GS equation given a parameterization of the plasma boundary and the current profile (p' and FF' functions). The current profile parameters are treated as unknowns. The goal is to reconstruct the internal magnetic flux surfaces of a tokamak plasma and the toroidal current density profile from the external magnetic measurements. This is a classic problem of inverse equilibrium determination. The current profile parameters can be evaluated by several different matching procedures. Matching of magnetic flux and field at the probe locations using the Biot-Savart law and magnetic Green's function provides a robust method of magnetic reconstruction. The matching of poloidal magnetic field on the plasma surface provides a unique method of identifying the plasma current profile. However, the power of this method is greatly compromised by the experimental errors of the magnetic signals. The Casing principle provides a very fast way to evaluate the plasma contribution to the magnetic signals. It has the potential of being a fast matching method. The performance of this method is hindered by the accuracy of the poloidal magnetic field computed from the equilibrium solver. A flux reconstruction package has been implemented which integrates a vacuum field solver using a filament model for the plasma, a multilayer perception neural network as an interface, and the volume integration of plasma current density using Green's functions as a matching method for the current profile parameters. The flux reconstruction package is applied to compare with the ASEQ and EFIT data. DOE

RESPONSE OF GaAs CHARGE STORAGE DEVICES TO TRANSIENT IONIZING RADIATION
D. L. Hetherington, J. F. Klem, R. C. Hughes, and H. T. Weaver 1993 5 p Presented at the International Semiconductor Device Research Symposium, Charlottesville, VA, 5-8 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-005273; SAND-93-2311C; CONF-931230-1) Avail: CASI HC A01/MF A01

Charge storage devices in which non-equilibrium depletion regions represent stored charge are sensitive to ionizing radiation. This results since the radiation generates electron-hole pairs that neutralize excess ionized dopant charge. Silicon structures, such as dynamic RAM or CCD cells are particularly sensitive to radiation since carrier diffusion lengths in this material are often much longer than the depletion width, allowing collection of significant quantities of charge from quasi-neutral sections of the device. For GaAs the situation is somewhat different in that minority carrier diffusion lengths are shorter than in silicon, and although mobilities are higher, we expect a reduction of radiation sensitivity as suggested by observations of reduced quantum efficiency in GaAs solar cells. Dynamic memory cells in GaAs have potential increased retention times. In this paper, we report the response of a novel GaAs dynamic memory element to transient ionizing radiation. The charge readout technique is nondestructive over a reasonable applied voltage range and is more sensitive to stored charge than a simple capacitor. DOE

LOW FREQUENCY DYNAMICS OF CO/Cu-BREAKDOWN OF BORN-OPPENHEIMER APPROXIMATION
C. Hirschmugl (Yale Univ., New Haven, CT.), G. P. Williams, and Y. J. Chabal 1993 14 p Presented at the 40th National Symposium of the American Vacuum Society, Orlando, FL, 15-19 Nov. 1993
(Contract DE-AC02-76CH-00016)
(DE94-005508; BNL-49777; CONF-9311104-16) Avail: CASI HC A03/MF A01

Synchrotron infrared studies of adsorbates on surfaces offer the possibility of probing low frequency vibrational modes and dynamics at high resolution (1 cm(exp -1), 125 (mu)eV). Extensive experiments have been performed for ordered submonolayers of CO on low index Cu surfaces (((radical)3 x (radical)3)R30 degree CO/Cu(111), c(2 x 2) CO/Cu(100) and (1 x 2) CO/Cu(110)), in the 100-2500 cm(exp -1) (approximately 12.5-312.5 MeV) range. These are the first IR experiments to directly probe the adsorbate-substrate vibrations for this system. In addition, however, several surprising features are observed including the dipole-forbidden hindered rotation and an unexpected broadband absorption. Two theories have been motivated by this work, and will be compared to our experimental results. The first theory is a cluster calculation by Head-Gordon and Tully, which takes into account the breakdown of the Born-Oppenheimer approximation and predicts lifetimes and frequencies of the vibrational modes for CO/Cu(100). Another Drude-based theory, proposed by Persson, considers the coupling of the conduction electron current to the vibrations of the adsorbates, accounting for the observation of both the broad-band absorption and dipole-forbidden peak. ON THE PREDICTION OF HAZ GRAIN SIZE USING MONTE CARLO SIMULATION
B. Radhakrishnan and T. Zacharia 1993 9 p Presented at the American Welding Society International Conference on Modeling and Control of Joining Processes, Orlando, FL, 8 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-005465; CONF-931234-4) Avail: CASI HC A02/MF A01

The Monte Carlo (MC) technique has been widely used to simulate the evolution of grain structures during recrystallization and curvature-driven grain growth processes. However, one of the drawbacks of the simulations is that a one-to-one correlation between the simulated and the experimental results of grain structures cannot be obtained. This is because the two important quantities, grain size and time, have been represented in the simulations as dimensionless quantities. The paper outlines a methodology by which a one-to-one correlation can be obtained between the simulated and experimental measures of grain size and time, so that the technique can be readily applied to quantitatively predict the microstructural evolution in real materials when they are subjected to complicated thermal cycles, such as in welding. ENERGY GAP STRUCTURE OF LAYERED SUPERCONDUCTORS
S. H. Liu (Oak Ridge National Lab., TN.) and R. A. Klemm Nov. 1993 17 p Presented at the Superconducting Superlattices and Multilayers and Oxide Superconductory Physics and Nanoengineering, Los Angeles, CA, 23-28 Jan. 1994
(Contracts W-31-109-eng-38; DE-AC05-84OR-21400)
(DE94-005132; ANL/MSD/CP-80230; CONF-940121-1) Avail: CASI HC A03/MF A01

We report the energy gap structure and density-of-states (DOS) of a model layered superconductor with one superconducting layer and one normal layer in a unit cell along the c-axis. In the physically interesting parameter range where the interlayer hopping strengths of the quasiparticles are comparable to the critical temperature, the peaks in the DOS curve do not correspond to the order parameter (OP) of the superconducting layer, but depend on the OP and the band dispersion in the c-direction in a complex manner. In contrast to a BCS superconductor, the DOS of layered systems have logarithmic singularities. Our simulated tunneling characteristics bear close resemblance to experimental results. DOE

HYSTERESIS PHENOMENA AT SPIN-FLOP TRANSITION INDUCED BY THE PULSED MAGNETIC FIELD
D. Georgiev, V. V. Nitts, and A. P. Sirotin 1992 8 p In JAPANESE Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-606851; JINR-R-14-92-401) Avail: CASI HC A02 (US Sales Only)

The experimental results of neutron diffraction on single crystals of Cr2O3 and alpha-Fe2O3 in which spin-flop transition is induced by the pulsed magnetic field are presented. The dynamic hysteresis arises in the measurements of the dependence of neutron scattering intensity on a field value; it is connected with the fact that the process of reaching equilibrium for sublattices magnetizations lags behind the change of the magnetic field. At a relatively high amplitude of field pulses, providing high rate of change of the field at phase transition, the hysteresis loop takes a limiting value and form. The dependences of phase reorientation on sample temperature correspond to the distinctions of phase diagrams of these substances. DOE

DEVELOPMENT OF ULTRA-LOW NOISE, HIGH PERFORMANCE 3 -5 QUANTUM WELL INFRARED PHOTODETECTORS (QWIPs) FOR FOCAL PLANE ARRAY STARING IMAGE SENSOR SYSTEMS Quarterly Progress Report, 1 Nov. 1993 - 31 Jan. 1994
Sheng S. Li 6 Feb. 1994 55 p
(AD-A275745) Avail: CASI HC A04/MF A01

During this reporting period (11-01-93 to 01-31-94) we have continued to make significant progress towards the program goals. We have developed a new normal incidence p-type strained-layer InGaAs/InAlAs quantum well infrared photodetectors (QWIP's) grown on InP by MBE. This PSL QWIP has achieved an ultra-low dark current and very high detectivity at 8.1 micrometers and 77 K. The detector is under background limited performance (BLIP) for T less than 100 K, which is the highest BLIP temperature ever reported for a QWIP. A dark current density of 7x10(exp -8) A/sq cm and BLIP detectivity of 5.9x10(exp 10) Jones were obtained for this QWIP at 77 K. Other tasks performed during this period include: (1) Design, fabrication and characterization of a new two-color stacked BTM and BTC QWIP for 3-5 and 8-12 micrometers IR detection, (2) design and fabrication and characterization of a normal incidence p-type compressive strained-layer InGaAs/GaAs QWIP grown on GaAs, and (3) theoretical and experimental studies of parameter optimization for an InGaAs BTM QWIP. Detailed results and accomplishments are described in this report. DTIC

CRYSTAL STRUCTURE OF La(2-x)Ba(x)CuO4
Susumu Katano, Satoru Funahashi, J. A. Fernandez-Baca, Nobuo Mori, Yutaka Ueda, and Kei-ichi Koga Jul. 1993 50 p
(DE94-707688; JAERI-M-93-131) Avail: CASI HC A03/MF A01

The crystal structure of La(2-x)Ba(x)CuO4 (0.03 less than or equal to x less than or equal to 0.24) have been studied at 115 K and 15 K by high-resolution neutron powder diffraction experiments. The variations in the Cu-O bond lengths refined by profile analysis suggest importance of the apical O(2) as well as that of the planar O(1) for the charge transfer. The compound with x = 0.125 at 15 K exhibits changes of the Cu-O bonds accompanied by the structural phase transition to the low-temperature tetragonal (LTT) phase. These results are discussed in terms of correlations with the superconducting properties of the system. Furthermore, to clarify a correlation between structural phase transitions and superconductivity, the crystal structure of the compound with x = 0.125 has been investigated under pressures up to 0.7 GPa. The transition to the LTT phase, observed at around 80 K at ambient pressure, decreases greatly at the rate of about -135 K/GPa. The bulk superconductivity, on the other hand, enhances under high pressure when the LTT phase disappears. These results show a strong relationship between the crystal structure and superconductivity in this system. DOE

INNOVATIVE OPTOELECTRONIC MATERIALS AND STRUCTURES USING OMVPE Annual Report, 1 Jan. - 31 Dec. 1993
James R. Shealy 14 Feb. 1994 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1311)
(AD-A275811) Avail: CASI HC A03

An advanced organo-metallic vapor phase epitaxy (OMVPE) process is being developed for the deposition of 3-5 semiconductor materials and structures. There are important optoelectronic device structures which cannot be realized be conventional means. The new OMVPE apparatus combines the multichamber reaction cell with deep UV photo-assisted growth and modulation flow epitaxial techniques. Using a combination of such processes, the-growth temperature requirements for 3-5 alloys can be substantially reduced. Selective growth on a sub-micron scale will be attempted with in-situ interference holography. The materials and techniques developed in this research program will result in significant simplifications to the fabrication sequence required to realize complex integrated optoelectronic circuits. SPUTTERING OF SINGLE CRYSTALS: EXPERIMENTAL EVIDENCE OF THE EJECTION PROCESS
N. Winograd Feb. 1994 34 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1410)
(AD-A275819; TR-70) Avail: CASI HC A03

The objective of this review is to summarize recent experimental evidence of the sputtering of atoms from single crystal targets. The information is extracted primarily from literature published within the last 10 years and is meant to compliment other recent reviews on single crystal sputtering. The emphasis of the discussion is on experiments that are performed on well characterized surfaces obtained under low-dose conditions. Because of this restriction, most of the experiments utilized laser post-ionization as the detection scheme. The discussion of experimental results is focused mainly toward comparison with results of molecular dynamics computer simulations. The review includes a discussion of experimental techniques, a sampling of results obtained at normal incidence with keV Ar(+) ions, and others obtained at variable incident angles. In addition, energy and angular distributions of ground-state and excited-state sputtered atoms are compared in detail. DTIC

ION CHANNELING PECULIARITIES IN YBa2Cu3 O7 MONOCRYSTAL
A. S. Borovik, A. A. Epifanov, V. S. Malyshevskij, and D. A. Korneev 1992 18 p In RUSSIAN
(DE94-606885; JINR-R-14-92-396) Avail: CASI HC A03/MF A01 (US Sales Only)

The approach was developed in the frame of the diffusion model. It permits the description of the fast light ions channeling process for the near-surface region of multicomponent low-symmetry crystals. Theoretical analysis of channeling in a thin film monocrystal YBa2Cu3O7 showed that the given structure has peculiarities of angle-dependent yield of scattered ions which is not specific for one-component crystals. The developed approach permits increasing the abilities of an experimental data interpretation, the aim of which is to extract details of the depth dependence of structural and dynamical properties of a thin monocrystal film of YBaCuO. MOCVD GROWTH OF GaN, AlN AND AlGaN FOR UV PHOTODETECTOR APPLICATIONS
Manijeh Razeghi 1993 144 p
(Contract N00014-93-1-0235)
(AD-A275078) Avail: CASI HC A07/MF A02

For the growth of III-V nitrides, three main problems hinder the production of device quality materials. They are large lattice mismatch between nitride films and substrates, high n-type background concentration, and difficulty in p-type doping. In the past year, we focused on the first problem, the lattice mismatch. Different substrates and different orientations of the substrates have been used in order to find a suitable substrate for the nitride growth. An atmospheric horizontal-type metalorganic chemical vapor deposition (MOCVD) reactor was used for the growth of aluminum nitride, gallium nitride and ternary Al(x)Ga(1-x)N. DTIC

InTlSb FOR LONG-WAVELENGTH INFRARED PHOTODETECTORS AND ARRAYS Annual Report
Manijeh Razeghi 1993 23 p
(Contracts N00014-92-J-1951; N00014-93-1-0409)
(AD-A275079) Avail: CASI HC A03/MF A01

The objective of this research program is to grow InTlSb alloys by low-pressure metalorganic chemical vapor deposition and to investigate their physical properties, in order to demonstrate the feasibility of long-wavelength infrared detectors based on these materials. Ab initio theoretical calculations indicate that InTlSb is a potential alternative to HgCdTe, with the added metallurgical and processing advantages offered by III-V technology. TlSb has been predicted to be a semimetal with a bandgap of -1.5 eV. Therefore, it should be possible to cover the whole infrared spectrum by alloying InSb with TlSb. In addition, TlSb is expected to remain lattice-matched to InSb within two percent, which is an advantage for the growth of device-quality InTlSb alloys. Even though TlSb was expected to favor the Cs-Cl-type structure, InTlSb alloy was estimated to exhibit a stable zinc-blend structure up to 15 to 20 percent Tl. DTIC

SILICON GERMANIUM CARBON HETEROEPITAXIAL GROWTH ON SILICON Final Technical Report, 15 Jul. 1992 - 14 Oct. 1993
James W. Mayer 14 Oct. 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0420)
(AD-A275197; AFOSR-94-0028TR) Avail: CASI HC A02

This project represents the initiation of band-gap engineering of Si-based devices at Arizona State University by James W. Mayer. While at Cornell, he directed the Microscience and Technology program supported by the Semiconductor Research Corporation. His Work on heteoepitaxy of SiGe on silicon convinced him that heteroepitaxy on Si was a viable technique for forming smaller band gap layers on silicon but the requirement was for larger energy-gap materials. In the fall of 1991, James Mayer visited Tom Picraux of Sandia National Laboratories and Clarence Tracy of Motorola Semiconductor Products to discuss the possibility of a joint program to investigate Silicon Germanium Carbon Heteroepitaxial Growth on Silicon. This represented a new research and development initiate for band gap engineering. DTIC

HIGH RESISTIVITY BUFFER LAYERS BY OXYGEN DOPING Final Report, 1 Sep. 1991 - 31 Aug. 1993
Marek Skowronski 31 Oct. 1993 52 p
(Grant AF-AFOSR-0373-91)
(AD-A274986; AFOSR-94-0023TR) Avail: CASI HC A04/MF A01

The goal of this project was to study the effects of GaAs doping with dimethyl aluminum methoxide (DMAIMO) during OMVPE growth. Incorporation of both aluminum and oxygen was analyzed as a function of growth conditions (growth temperature, V/III ratio, reactor pressure, growth rate, and DMAIMO mole fraction) by secondary ion mass spectroscopy. The aluminum content changed only slightly with deposition parameters but oxygen incorporation exhibited thermally activated behavior with the activation energy of 2.0 eV. At temperatures below 500 C oxygen content approached that of aluminum indicating that Al-O is incorporated as a pair into GaAs. The oxygen concentrations were as high as 5 x 10(exp 19)/cu cm without degrading surface morphology. Layers with high oxygen content exhibited short carrier lifetime (very weak near-band-edge photoluminescence) and high resistivity as determined by C-V profiles and Hall effect measurements. Localized vibrational mode spectroscopy proved that aluminum and oxygen atoms remain bonded as pairs in the volume of the epilayer. DTIC

PREPARATION, CHARACTERIZATION, AND FACILE THERMOLYSIS OF (X2GaP(SiMe3)2) (X = Br, I) AND (Cl3Ga2P)n; NEW PRECURSORS TO NANOCRYSTALLINE GALLIUM PHOSPHIDE
Steven R. Aubuchon, Andrew T. McPhail, Richard L. Wells, Julia A. Giambra, and James R. Bowser 18 Jan. 1994 25 p
(Contract N00014-89-J-1545)
(AD-A275019; DU/DC/TR-38) Avail: CASI HC A03/MF A01

(Br2GaP(SiMe3)2)2 and (I2GaP(SiMe3)2)2 were prepared by the 1:1 mole ratio reaction of the corresponding gallium(III) halide with (Me3Si)3P. Direct introduction probe mass spectrometry indicates that the former product is dimeric in the gas phase; single crystal x ray analysis reveals that it is also dimeric in the solid state and it is isostructural with (Cl2GaP(SiMe3)2)2, but the crystals are not isomorphous. (Br2GaP(SiMe3)2)2 crystallizes in the orthorhombic system, space group Pbca, with a = 13.803(2), b = 16.652(2), c = 13.636(2) A, V = 3134(1) A(exp 3), and D(sub calc) = 1.725 g/cu cm for Z = 4; the mean Ga-P bond length in the planar Ga-P-Ga-P core is 2.386 A. Also described is the synthesis of (Cl3Ga2P)(n) via the 2:1 mole ratio reaction of GaCl3 and (Me3Si)3P. All of the title compounds undergo thermolysis at relatively low temperature to yield nanocrystalline GaP. Thermolysis has been studied by thermal gravimetric analysis, and the resultant air-stable powders have been characterized by x ray diffraction and elemental analysis. DTIC

The use of alternative group 13 and group 15 compounds to fabricate traditional 13-15 materials has received great attention over the past decade. Indeed, fundamental chemistry involving the structure, bonding, and reactivity of such species has been of primary concern in our laboratory for some time. It is our belief, that through these investigations a better understanding can be obtained as to the factors that influence and dictate the reactivity of these species. Herein we report the solid-state structures of (Me3SiCH2)2InCl2 (I) and (Me3SiCH2)InCl2 (infinity) (II) which have been found to be dimeric and polymeric, respectively. DTIC

ATOMIC AND MAGNETIC STRUCTURE OF YBa2(Cu(1-x)Fe(x))3O(6+y) AT 0.05 LESS THAN OR EQUAL TO x LESS THAN OR EQUAL TO 0.30, y IS APPROXIMATELY EQUAL TO 1 AND y IS APPROXIMATELY EQUAL TO 0.5
A. M. Balagurov and I. S. Lyubutin 1992 24 p In RUSSIAN
(DE94-606852; JINR-R-14-92-579) Avail: CASI HC A03/MF A01 (US Sales Only)

The system YBa2Cu(1-x)Fe(x)3O(6+y) was studied by neutron diffraction and Mossbauer spectroscopy in the wide interval of iron concentration, 0.05 less than or = x less than or = 0.30, in both oxygen saturated, y approx. = 1, and oxygen deficient, y approx. = 0.5, compositions. The very detailed data about the atomic structure and magnetic state were obtained for all the samples and compared with the Y123-Cu/Co system. A marked difference in magnetic phase diagrams of Fe and Co systems was established. DOE

X RAY STANDING WAVE STUDIES OF UNDERPOTENTIALLY DEPOSITED METAL MONOLAYERS
G. M. Bommarito, D. Acevedo, J. F. Rodriguez, H. D. Abruna, and T. Gog 1992 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275409) Avail: CASI HC A03

The x-ray standing wave technique has been employed in the study of the structure of underpotentially deposited (UPD) copper on an iodine covered platinum surface and of copper on a Au(100) single crystal electrode. For Cu UPD on Pt, surface coverage isotherms derived from both electrochemical and x-ray measurements are compared. The growth mode of the copper ad-layer appears to be strongly influenced by the electrode's surface morphology. For Cu UPD on Au(100), the coherence of the adlayer is strongly dependent on the mode of deposition. DTIC

Epitaxial heterojunctions formed between high temperature superconductors and metallic or semiconducting oxide barrier layers are provided. Metallic perovskites such as LaTiO3, CaVO3, and SrVO3 are grown on electron-type high temperature superconductors such as Nd(1.85)Ce(0.15)CuO(4-x). Alternatively, transition metal bronzes of the form A(x)MO(3) are epitaxially grown on electron-type high temperature superconductors. Also, semiconducting oxides of perovskite-related crystal structures such as WO3 are grown on either hole-type or electron-type high temperature superconductors.

NONADIABATIC EFFECTS IN THE QUANTUM HALL REGIME Ph.D. Thesis
Douglas Arthur Page 1992 319 p
Avail: Univ. Microfilms Order No. DA9314373

In considering the effect of uniform external fields on the behavior of independent electrons in a two dimensional crystal, the relationship of transport properties to Berry's phase, in the limit of weak electric field, is examined. A numerical algorithm, based on the effective Hamiltonian formalism, is developed to study the magnetic subbands corresponding to an isolated Bloch band. This algorithm involves a matrix diagonalization at only three points in the magnetic Brillouin zone, and allows the effects of

varying bandstructure to be included. Results for the spectrum and quantized Hall conductivities are presented for two simple forms of band dispersion, over a range of magnetic field strengths. The effects of a finite electric field are treated in a time dependent formalism, in which the electric and magnetic fields appear symmetrically. In addition to a wave vector k, the states are characterized by a frequency omega specifying their behavior under time translations through a fundamental period. The effective Hamiltonian formalism is again employed to obtain concrete results. An isolated Bloch band is found to break up into 'frequency' subbands, each characterized by a frequency dispersion omega(k). A method of obtaining the transport properties of the system is outlined. This method is shown to be consistent with known results for the weak field limit, as well as a more conventional approach in the time independent gauge. Numerical results for a model system are presented over a range of electric field strengths. A transition between strong and weak field regimes is seen, with level repulsions between the frequencies playing an important role. These results show how the magnetic subband structure and the corresponding integer Hall conductivities emerge as the electric field becomes weaker. In this regime, the behavior can be understood by comparison to the predictions of the adiabatic approximation. The origin of deviations from the weak field predictions is identified. Dissert. Abstr.

STUDY OF IRON EXCHANGED ZEOLITES BY MOESSBAUER EFFECT AND ELECTRON SPIN RESONANCE SPECTROSCOPY Ph.D. Thesis [ESTUDIO DE ZEOLITAS DE HIERRO POR EL EFECTO MOESSBAER Y LA RESONANCIA PARAMAGNETICA ELECTRONICA]
C. E. AguirreCampuzano 1993 76 p In SPANISH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-605138; INIS-mf-13718) Avail: CASI HC A05 (US Sales Only)

Crystalline iron exchanged NaY zeolites, prepared from aqueous solutions and calcined at atmospheric conditions, have been studied and characterized by XRD, Moessbauer and EPR spectroscopies and TGA analysis. Three iron sites are clearly distinguished from Moessbauer and EPR measurements. Firstly, characteristic Moessbauer and EPR spectra may arise from framework sites, suggesting that Fe has substituted Al. It is also found that their spectroscopic signals are not intensity affected by thermal treatments. Secondly, a Moessbauer doublet which may arise from octahedral sites in the large cavity of the zeolite, shows however, that this doublet and its EPR signal are intensity temperature affected. An additional line broadening is observed on the low velocity line of this doublet. Thirdly, characteristic Moessbauer and EPR signals, which are also intensity temperature dependent have been associated to accluded material, where the Moessbauer doublet presents the line broadening effect before mentioned. Such line broadening effect may be due to perturbing signals from iron ions in tetrahedral sites. Finally, it has been observed that during calcination of the FeY zeolites, the three characteristic EPR signals for the three iron sites, do not increase at the expenses of the other. A result that may suggest a strong bonding between Fe-site of the Y zeolite, irrespective of the iron source. DOE

Research at the National Renewable Energy Laboratory (NREL) has demonstrated that fullerenes can be produced using highly concentrated sunlight from a solar furnace. Since they were first synthesized in 1989, fullerenes have been the subject of intense research. They show considerable commercial potential in advanced materials and have potential applications that include semiconductors, superconductors, high-performance metals, and medical technologies. The most common fullerene is C60, which is a molecule with a geometry resembling a soccer ball. Graphite vaporization methods such as pulsed-laser vaporization, resistive heating, and carbon arc have been used to produce fullerenes. None of these, however, seems capable of producing fullerenes economically on a large scale. The use of concentrated sunlight may help avoid the scale-up limitations inherent in more established production processes. Recently, researchers at NREL made fullerenes in NREL's 10 kW high flux solar furnace (HFSF) with a vacuum reaction chamber designed to deliver a solar flux of 1200 W/sq cm to a graphite pellet. Analysis of the resulting carbon soot by mass spectrometry and high pressure liquid chromatography confirmed the existence of fullerenes. This paper presents the method, experimental apparatus, and results of fullerene production research performed with the HFSF. DOE

NANODISLOCATION STRUCTURES GENERATED IN SHOCKED CRYSTALS Ph.D. Thesis
Faris Afif Bandak 1993 172 p
Avail: Univ. Microfilms Order No. DA9313332

Dislocation structures proposed to model plastic deformation at a shock front are analyzed. The creation and glide movement of the dislocations are considered. Glide-type movement violates the condition of one-dimensional strain except if dislocation dipoles with Burgers vectors parallel and antiparallel to the shock propagation direction are directly generated by alternating shear stresses as in a punching action. The stress, strain and dilatation characteristics are presented for a dislocation structure originally proposed by Armstrong, Miller and Sandusky (AMS) to give a residual one-dimensional strain state. The AMS dislocation structure is related to independent results from a molecular dynamics description of shear displacements in a shocked triangular lattice and is used as a basis for estimating the extent of post-shock strengthening levels. The shock strengthening predictions are in reasonable agreement with post-shock deformation measurements. Molecular dynamics calculations are conducted to investigate several aspects of the AMS dislocation model. The evolution of dislocations from the shock compression of a vacancy cluster in a body centered cubic lattice is studied using molecular dynamics. Detailed calculations have revealed the atomic displacements by which the clustered vacancies collapse. The energetics of the process were also monitored in detail. Stable (100) and (111) Burgers vector dislocations have been identified in dipole configurations. The post-shock stability of the AMS dipole nanostructure was also evaluated on a molecular dynamics basis and the stress/strain behaviors of the crystal for the pre- and post-shock compression conditions were compared. Dissert. Abstr.

(DE94-006428; PNL-8670) Avail: CASI HC A05

This collection of benchmark timings represents a snapshot of the hardware and software capabilities available for ab initio quantum chemical calculations at Pacific Northwest Laboratory's Molecular Science Research Center in late 1992 and early 1993. The 'snapshot' nature of these results should not be underestimated, because of the speed with which both hardware and software are changing. Even during the brief period of this study, we were presented with newer, faster versions of several of the

codes. However, the deadline for completing this edition of the benchmarks precluded updating all the relevant entries in the tables. As will be discussed below, a similar situation occurred with the hardware. The timing data included in this report are subject to all the normal failures, omissions, and errors that accompany any human activity. In an attempt to mimic the manner in which calculations are typically performed, we have run the calculations with the maximum number of defaults provided by each program and a near minimum amount of memory. This approach may not produce the fastest performance that a particular code can deliver. It is not known to what extent improved timings could be obtained for each code by varying the run parameters. If sufficient interest exists, it might be possible to compile a second list of timing data corresponding to the fastest observed performance from each application, using an unrestricted set of input parameters. Improvements in I/O might have been possible by fine tuning the Unix kernel, but we resisted the temptation to make changes to the operating system. Due to the large number of possible variations in levels of operating system, compilers, speed of disks and memory, versions of applications, etc., readers of this report may not be able to exactly reproduce the times indicated. Copies of the output files from individual runs are available if questions arise about a particular set of timings. DOE

AGGREGATION EQUILIBRIA IN ARSENIC DOPED SILICON
M. Derdour, G. Furlan, and D. Nobili Aug. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-607269; IC-93/265) Avail: CASI HC A02 (US Sales Only)

Carrier density profile determinations are reported which confirm that a mass action relation holds between the ionized and the inactive mobile As in silicon. Experiments were performed under equilibrium conditions at temperatures in the range 780-885 C. The carrier density n vs. the dopant concentration N(sub T) exhibits a very pronounced saturation behavior which is compared with the one expected in well known cluster models. These results complement the recent finding that the inactive As can exist in equilibrium with the monoclinic SiAs. From this information and previous SAXS, TEM, and EXAFS results one can conclude that a pre-precipitation phenomenon, with its inherent cluster distribution, is responsible for the inactive As. DOE

ECR PLASMA SYNTHESIS OF SILICON NITRIDE FILMS ON GaAs AND InSb
J. C. Barbour, M. L. Lovejoy, C. I. H. Ashby, A. J. Howard, J. S. Custer, and R. J. Shul 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-005575; SAND-93-1662C; CONF-931108-47) Avail: CASI HC A02/MF A01

Growth of high-quality dielectric films from Electron Cyclotron Resonance (ECR) plasmas provides for low-temperature surface passivation of compound semiconductors. Silicon nitride (SiN(x)) films were grown at temperatures from 30 to 250 C on GaAs substrates. Stress in films was measured as a function of bias applied during growth (varied from 0 to 200 V), and of sample annealing treatments. Composition profiles of the samples were measured using ion beam analysis. The GaAs photoluminescence (PL) signal after SiN(x) growth without an applied bias (ion energy congruent to 30 eV) was twice as large as the PL signal from the cleaned GaAs substrate. The PL signal from samples biased at -50 and -100 V indicated that damage degraded the passivation quality, while atomic force microscopy of these samples showed a threefold increase in rms surface roughness relative to unbiased samples. The sample grown with a bias of -200 V showed the largest reduction in film stress but also the smallest PL signal. DOE

CONVECTIVE FLOW EFFECTS ON PROTEIN CRYSTAL GROWTH
Semiannual Progress Report No. 2, 1 Aug. 1993 - 31 Jan. 1994
Franz Rosenberger and Lisa A. Monaco 31 Jan. 1994 34 p
(Grant NAG8-950)
(NASA-CR-195785; NAS 1.26:195785) Avail: CASI HC A03/MF A01

The long-term stability of the interferometric setup for the monitoring of protein morphologies has been improved. Growth or dissolution of a crystal on a 100 A scale can now be clearly distinguished from dimensional changes occurring within the optical path of the interferometer. This capability of simultaneously monitoring the local interfacial displacement at several widely-spaced positions on the crystal surface with high local depth resolution, has already yielded novel results. We found with lysozyme that (1) the normal growth rate is oscillatory, and (2) the mean growth step density is greater at the periphery of a facet than in its center. The repartitioning of Na(+) and Cl(-) ions between lysozyme solutions and crystals was studied for a wide range of crystallization conditions. A nucleation-growth-repartitioning model was developed to interpret the large body of data in a unified way. The results strongly suggests that (1) the ion to lysozyme ratio in the crystal depends mostly on kinetic rather than crystallographic parameters, and (2) lysozyme crystals possess a salt-rich core with a diameter on the order of 10 microns. The computational model for diffusive-convective transport in protein crystallization (see the First Report) has been applied to a realistic growth cell geometry, taking into account the findings of the above repartitioning studies. These results show that some elements of a moving boundary problem must be incorporated into the model in order to obtain a more realistic description. Our experimental setup for light scattering investigations of aggregation and nucleation in protein solutions has been extensively tested. Scattering intensity measurements with a true Rayleigh scatterer produced systematically increased forward scattering, indicating problems with glare. These have been resolved. Preliminary measurements with supersaturated lysozyme solutions revealed that the scatterers grow with time. Work has begun on a computer program for the unified evaluation of simultaneously obtained, multi-angle static and dynamic light scattering data. Author

NEW EVIDENCE FOR FLUX CUTTING IN TYPE II SUPERCONDUCTORS M.S. Thesis
David Leblanc 1992 75 p
(ISBN-0-315-85830-3; CTN-94-61168) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

New evidence is presented for cross flow and cutting of nonparallel flux lines in type-II superconductors. A dramatic reversal is observed in the evolution of the axial flux density in the cavity of a hollow cylinder when the magnitude of a helical magnetic field is increased or decreased along the cylinder surfaces. Measurements of the concurrent evolution of the axial flux density threading the cylinder wall complement the above data. These two phenomena are explained, based on the ideas of two way traffic of sublattices of nonparallel flux lines traversing each other via flux line cutting processes. The classical critical state concept is reviewed and the essential features of the flux cutting process, cross traversal of flux line sheets, and attendant breathing modes are outlined. A generalized critical state model incorporating a phenomenological framework based on Maxwell's equations, standard physical constraints, and two separate energy dissipation mechanisms is summarized. Data curves are presented and it is shown in qualitative detail that the observed behavior demonstrates that flux line cutting occurs and associated breathing in and out of nonparallel flux lines takes places across the surface of type-II superconductors subjected to a varying helical magnetic field. INFLUENCE OF DOPING ON THE ELECTRONIC STRUCTURE OF (La, Sr)2CuO4
R. H. Howell, M. J. Fluss, P. A. Sterne, and J. H. Kaiser 23 Aug. 1993 15 p Presented at the Physics and Chemistry of Molecular and Oxide Superconductors, Eugene, OR, 27-31 Jul. 1993
(Contract W-7405-eng-48)
(DE94-006383; UCRL-JC-114155; CONF-930710-5) Avail: CASI HC A03/MF A01

High statistics, (greater than 4 x 10(exp 8) counts), room temperature measurements of the electron-positron momentum density of La(2-x)Sr(x)CuO4 have been performed for samples with Sr concentrations of x - 0.0, 0.1, 0.13 and 0.2. These spectra have been analyzed in conjunction with theoretical calculations of the electron-positron momentum density. The metallic samples show features consistent with the presence of a Fermi surface, but its evolution with increasing Sr concentration does not follow the predictions of band theory. These results may indicate the effects of electron-electron correlation on the electron momentum distribution in the Cu-O plane. DOE

ATOMIC-SCALE STRUCTURE AND CHEMISTRY OF INTERFACES BY Z-CONTRAST IMAGING AND ELECTRON ENERGY LOSS SPECTROSCOPY IN THE STEM
M. M. McGibbon, N. D. Browning, M. F. Chisholm, S. J. Pennycook, V. Ravikumar, and V. P. Dravid Dec. 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-006563; CONF-931108-69) Avail: CASI HC A02/MF A01

The macroscopic properties of many materials are controlled by the structure and chemistry at grain boundaries. A basic understanding of the structure-property relationship requires a technique which probes both composition and chemical bonding on an atomic scale. The high-resolution Z-contrast imaging technique in the scanning transmission electron microscope (STEM) forms an incoherent image in which changes in atomic structure and composition can be interpreted intuitively. This direct image allows the electron probe to be positioned over individual atomic columns for parallel detection electron energy loss spectroscopy (EELS) at a spatial resolution approaching 0.22nm. In this paper we have combined the structural information available in the Z-contrast images with the bonding information obtained from the fine structure within the EELS edges to determine the grain boundary structure in a SrTi3 bicrystal. STRONG OVERLAP AND TRANSMISSION IN TRIPLE BARRIER RESONANT STRUCTURES
R. Romo (Centro de Investigacion Cientifica y de Educacion Superior de Ensenada, Mexico.) and G. Garcia-Calderon Aug. 1993 22 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608103; IC-93/274) Avail: CASI HC A03 (US Sales Only)

The transition from two unity peaks into a single under-unity peak in the transmission coefficient T in symmetrical triple barrier resonant structures, as the width of the central barrier is increased, is analyzed in terms of a resonance formalism in a Breit-Wigner fashion to show that the above situation is due to strong overlap between the two resonance states of the corresponding miniband, i.e., T = T(sub 1) + T(sub 2) + T(sub 12). Results contradict a recent claim that the under-unity transmission peak corresponds to a singlet resonance state. We discuss the implications of strong overlap on the current-voltage characteristics of these triple barrier structures. DOE

ELECTRONIC STRUCTURE OF Zn-BASED QUANTUM WELLS
B. A. Camacho Aug. 1993 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608104; IC-93/279) Avail: CASI HC A03 (US Sales Only)

The electronic structure of recently demonstrated laser active heterostructures based on ZnSe quantum wells has been calculated within a tight-binding framework. A Green function method, appropriate to consider layered systems, is applied to obtain the main features of energy spectrum and density of states and spatial probability distribution of valence states. The formalism allows strain effects to be taken into account in a very natural way. In addition, atomic orbital composition of the uppermost valence bands as a function of the quantum well width are easily obtained. Hopping parameters are scaled according to Harrison's d(exp 2) law. Since the quantum well itself is a ternary compound, we describe it within the virtual crystal approximation (VCA). A systematic study of the effects of well width in these structures is presented. VIBRATIONAL PROPERTIES OF HOMOPOLAR AND HETEROPOLAR SURFACES AND INTERFACES OF THE CdTe/HgTe SYSTEM
R. Rey-Gonzales, B. A. Camacho, and L. Quiroga Aug. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608105; IC-93/280) Avail: CASI HC A03 (US Sales Only)

We present results of calculations for the density of vibrational modes for (001) and (111) homopolar as well as for (011) heteropolar free surfaces of CdTe and HgTe. A rigid-ion model with a dynamical matrix parametrization including force constants up to second neighbors is used. We report on the existence of highly localized surface resonant modes at the top of the acoustic branch for CdTe and the bottom of the optical branch for HgTe. A different behavior in the three directions analyzed is found. The interface atomic planes show themselves as phonon gapless layers. The contribution of in-plane and out-of-plane vibration is analyzed for both the surface and interface cases. DOE

II-VI WIDE BAND GAP SEMICONDUCTORS UNDER HYDROSTATIC PRESSURE
R. Baquero, R. DeCoss, and D. Olguin Aug. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608106; IC-93/281) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

We set an analytical expression for the gap as a function of hydrostatic deformation, E(sub g)(epsilon), by diagonalizing in Gamma the corresponding empirical tight-binding Hamiltonian (ETBH). In the ETBH we use the well known d(exp -2) Harrison scaling law (HSL) to adjust the TB parameter (TBP) to the changes in interatomic distances. We do not consider cation-anion charge transfer. We calculate E(sub g)(epsilon) for wide band gap II-VI semiconductors with zincblende crystal structure for deformations under pressure up to -5 percent. Results are in good agreement with experiment for the compounds of lower ionicity but deviate as the ionicity of the compound increases. This is due to the neglect of charge transfer which should be included self-consistently. Within the approximation we always find a positive second derivative of E(sub g)(epsilon) with respect to epsilon, independent of the material. Furthermore, the inclusion of deviations from HSL appear to be unimportant to this problem. DOE

The properties of metal cluster (MC) are discussed. The MC representing the bound systems of atoms of some metals have recently been discovered to possess shells of the same type as in atoms and nuclei. Subsequent investigation has shown the striking similarities of many features of MC and nuclei: shells, quadrupole deformation, fission, and giant resonances. As a result, a lot of ideas and methods (first of all the theoretical ones) of nuclear structure may be applied after some modification in the MC field. MC have also their own very specific properties, such as supershells, the opportunity to form very large clusters with the number of atoms up to 20000, mixed clusters and etc. DOE

DISLOCATION LOOPS IN SPINEL CRYSTALS IRRADIATED SUCCESSIVELY WITH DEEP AND SHALLOW ION IMPLANTS
Rebecca X. Ai, Elizabeth A. Cooper, Kurt E. Sickafus, Michael Nastasi, Nicole Bordes, and R. C. Ewing 1993 6 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract W-7405-eng-36)
(DE94-005083; LA-UR-93-4464; CONF-931108-34) Avail: CASI HC A02/MF A01

This study examines the influence of microstructural defects on irradiation damage accumulation in the oxide spinel. Single crystals of the compound MgAl2O4 with surface normal (111) were irradiated under cryogenic temperature (100 K) either with 50 keV Ne ions (fluence 5.0 x 10(sup 12)/cm(sup 2)), 400 keV Ne ions (fluence 6.7 x 10(sup 13)/cm(sup 2)) or successively with 400 keV Ne ions followed by 50 keV Ne ions. The projected range of 50 keV Ne ions in spinel is approximately 50 mn ('shallow') while the projected range of 400 keV Ne ions is (approximately)500 mn ('deep'). Transmission electron microscopy (TEM) was used to examine dislocation loops/defect clusters formed by the implantation process. Measurements of the dislocation loop size were made using weak-beam imaging technique on cross-sectional TEM ion-implanted specimens. Defect clusters were observed in both deep and shallow implanted specimens, while dislocation loops were observed in the shallow implanted sample that was previously irradiated by 400 keV Ne ions. Cluster size was seen to increase for shallow implants in crystals irradiated with a deep implant (size approximately 8.5 nm) as compared to crystals treated only to a shallow implant (size approximately 3.1 nm). MuSR MEASUREMENT OF THE MAGNETIC PENETRATION DEPTH AND COHERENCE LENGTH IN THE HIGH-Tc SUPERCONDUCTOR YBa2Cu3O(6.95) Ph.D. Thesis

Tanya Maria Riseman May 1993 248 p
(ISBN-0-315-85385-9; CTN-94-61154) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The temperature dependence and anisotropy of the magnetic penetration depth L and the Ginzburg Landau parameter K in a high temperature Y-Ba-Cu-O superconductor was studied using muon spin rotation (MSR) measurements of the local field inhomogeneity produced by the vortex state. The anisotropy of L leads to variation in the measured field inhomogeneity as a function of the angle between the applied field and the c-axis of the crystal. If the applied field is not parallel to one of the superconductor's principal axes, an attractive force between vortices along one direction arises when the superconductor is cooled in a constant and low field. When the net intervortex repulsion exceeds the forces pinning the vortices in place, the aspect ratio of the isoceles triangle defining the vortex lattice will change. The degree of disorder makes it impossible to determine the low temperature aspect ratio of the Y-Ba-Cu-O superconductor using MSR. In the vortex lattice, the maximum field is reached at the vortex core. In the low and moderate field regimes, the core occupies a very small percentage of the lattice's unit cell, so the maximum field is not observable by MSR. In the high field regime, the core results in a high field cutoff in the distribution of local fields, which can be observed directly in the Fourier transform of MSR data. Author (CISTI)

PHOTOELECTRONIC STUDY OF GaAs EPILAYERS AND In(x)Ga(1-x)As/GaAs QUANTUM WELLS M.S. Thesis
Ye Wang 1992 165 p
(ISBN-0-315-85756-0; CTN-94-61162) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The photo electromagnetic (PEM) effect was used to perform experiments on photocarrier transport properties in GaAs substrates and epitaxial layers. For the undoped semi-insulating substrate, the carrier mobility at 77 K was measured by the PEM effect method, giving a value of 40,000 sq cm/volt/second. It was found that the carrier diffusion length is 0.27 micrometers at 300 K and 0.44 micrometers at 77 K. For the 3.4 micrometer thick epitaxial layer grown by metal organic chemical vapor deposition, the carrier diffusion length was measured to be 2.6 micrometers at 300 K, 3.1 micrometers at 77 K, and 3.5 micrometers at 5 K. A photocurrent spectroscopy study of In(x)Ga(1-x)As/GaAs quantum wells on Cr-doped and undoped substrates was also performed. Several well-resolved structures related to inter-subband transitions are observed in the photo conductivity spectra at both 300 K and 77 K, and they are in good agreement with calculations taking into account the strain induced splitting of the bands. Both Cr-doped and undoped substrates have been found to influence the results, as shown by optical quenching techniques.

ELECTROOPTICAL AND OPTICAL EVALUATION OF Pb(Zr,Ti)O3 THIN FILMS USING WAVEGUIDE REFRACTOMETRY
B. G. Potter, Jr., M. B. Sinclair, D. Dimos, B. A. Tuttle, and R. W. Schwartz 1993 21 p Presented at the 1st Meeting of the Pacific Rim Ceramic Societies, Honolulu, HI, 7-10 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-006374; SAND-93-0974C; CONF-931142-7) Avail: CASI HC A03/MF A01

Prism-coupled, waveguide refractometry was utilized to independently monitor electric field-induced changes in the extraordinary and ordinary refractive indices of a Pb(Zr(0.53)Ti(0.47))O3(PZT 53/47) thin film. Under an electric field, applied normal to the film plane and corresponding to saturation of the electric polarization, ratio of the extraordinary to ordinary refractive index change ((Delta)n(sub e)/(Delta)n(sub o)) is found to be (minus)4/1, contributing to a net birefringence change ((Delta)n(sub e)-n(sub o)) of -0.021. The technique, thus, accesses both diagonal and off-diagonal elements of the electrooptic response tensor describing the macroscopic behavior of the polycrystalline film. In addition, the widths of waveguide mode reflectivity minima were sensitive to variation in the microstructure of several PZT (40/60) films, indicating that the refractometry technique can provide information helpful in evaluating optical quality in these films.

The influence of in-situ electronic perturbations on defect generation during 150-keV proton implantation into biased silicon p-n junctions has been investigated. The concentration and spatial distribution of the deep traps were characterized using a modification of the double corRelation deep level transient spectroscopy technique (D-DLTS). With the in-situ electric field applied, a decrease in concentration of vacancy-related, as well as H-related, traps was observed. 500 keV He(+) implantation was also performed to supplement the above studies and to differentiate any passivation effects due to hydrogen. A model based on the charge states of hydrogen and vacancies was used to explain the observed behavior.

DENSIFICATION AND CRYSTALLIZATION OF ZIRCONIA THIN FILMS PREPARED BY SOL-GEL PROCESSING
R. W. Schwartz, J. A. Voigt, C. D. Buchheit, and T. J. Boyle 1993 28 p Presented at the 1st Meeting of the Pacific Rim Ceramic Societies, Honolulu, HI, 7-10 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-005573; SAND-93-0975C; CONF-931142-5) Avail: CASI HC A03/MF A01

We have investigated the effects of precursor nature and heat treatment schedule on the densification and crystallization behavior of sol-gel derived zirconia thin films. Precursor solutions were prepared from n-propanol, zirconium (IV) n-propoxide, and either acetic acid, or 2,4-pentanedione (acac) and water additions. By controlling the ligand type and ligand-to-metal ratio, we were able to prepare films which displayed significant differences in densification behavior. We attribute the dissimilarity in densification to variations in the nature of the as-deposited films, as influenced by ligand type and concentration. While the acac-derived film was a physical gel, (i.e., a physical aggregation of the oligomeric species), the acetic acid-derived film, which exhibited less consolidation, was a chemical gel that could not be redissolved in the parent solvent. Films prepared with large acac/metal ratios and small water additions exhibited minimal crosslinking at 25 C, displayed the greatest consolidation (approximately 86% shrinkage) and the highest refractive index (n = 2.071) when heat treated. These results indicate the importance that M-O-M bonds (crosslinks) formed at low temperature can have on densification behavior. We also report on the effects of heat-treatment schedules and ramp rates on densification behavior. All of the films of the present study crystallized into the cubic phase, at temperatures ranging from approximately 400 C to greater than 700 C, depending on the heating rate.

(DE94-005576; SAND-93-1483C; CONF-931108-48) Avail: CASI HC A01/MF A01

We have grown InAs(1-x)Sb(x)/In(1-y)Ga(y)As strained-layer superlattice (SLS) semiconductors lattice matched to InAs using a variety of conditions by metal-organic chemical vapor deposition. The V/III ratio was varied from 2.5 to 10 at 475 C, at pressures of 200 to 660 torr and growth rates of 3-5 angstrom/s and layer thicknesses ranging from 55 to 152 angstrom. Composition of InAsSb ternary can be predicted from the input gas molar flow rates using a thermodynamic model. At lower temperatures, the thermodynamic model must be modified to take account of the incomplete decomposition of arsine and trimethylantimony. Diodes have been prepared using Zn as the p-type dopant and undoped SLS as the n-type material.

The diode was found to emit at 3.56 (mu)m. These layers have been characterized by optical microscopy, SIMS, x-ray diffraction, and transmission electron diffraction. The optical properties of these SLS's were determined by infrared photoluminescence and absorption measurements. DOE

BUTTERFLY AND SCALING LAW IN YBa2Cu4O8
Ming Xu, D. K. Finnemore, K. Zhang, B. Dabrowski, G. W. Crabtree, and D. G. Hinks 1994 4 p Presented at the 7th IWCC International Workshop on Critical Currents in Superconductors, Alpbach, Austria, 24-27 Jan. 1994
(Contracts W-7405-eng-82; W-31-109-eng-38)
(DE94-006037; IS-M-779; CONF-940122-1) Avail: CASI HC A01/MF A01

Magnetization hysteresis loops have been studied over a wide range of field and temperature for a single crystal of Y-124 in order to look for scaling in characteristic fields of the loops. A multivalued magnetization curve in the shape of 'butterfly' is observed with characteristic minimum fields, H(sub min), and maximum fields, H(sub max), that change systematically with temperature. H(sub max) varies as (1-T/T(sub c))(exp alpha) where alpha is close to 1.5. On a reduced scale, H(sub max) for this Y-124 sample is very similar to several Y-123 samples, suggesting that the origin of this effect is the same in these two systems. H(sub min) is exponential in temperature. DOE

STRAIN RELAXATION AND SURFACE ROUGHNESS AS A FUNCTION OF GROWTH TEMPERATURE IN LINEARLY GRADED In(x)Al(1-x)As (x = 0.05 TO 0.25) BUFFERS
J. A. Olsen (California Univ., Santa Barbara.), E. L. Hu (California Univ., Santa Barbara.), S. R. Lee, I. J. Fritz, A. J. Howard, B. E. Hammons, and J. Y. Tsao 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-94AL-85000)
(DE94-005430; SAND-93-1462C; CONF-931108-57) Avail: CASI HC A02

The relation of relaxation to surface morphology in linearly-graded InAlAs was examined as a function of growth temperature using x-ray diffraction and atomic force microscopy (AFM). Samples were grown at temperatures ranging from 370 to 550C. Weak diffraction features for samples grown at 370 and 420C limited determination of the extent of their relaxation. The fractional relaxation of samples grown between 470 to 550C was essentially identical (approximately 77%) and symmetric in orthogonal (110) directions. The character of the surface morphology changed from random small scale roughness to a roughness more periodic in nature as the growth temperature increased. Although no asymmetry was observed in the relaxation, the roughness developed an asymmetry at higher growth temperatures with more prominent ridges along (-1 1 0) - (1 -1 0). DOE

INVESTIGATION OF THE PHASE EQUILIBRIA AND PHASE TRANSFORMATIONS ASSOCIATED WITH THE Bi2Sr2CaCu2O(y) SUPERCONDUCTOR Ph.D. Thesis
T. Holesinger Dec. 1993 172 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-82)
(DE94-004889; IS-T-1631) Avail: CASI HC A08

The solid solution region and reaction kinetics of the Bi2Sr2CaCu2O(sub y) (2212) superconductor were examined as a function of temperature and oxygen partial pressure. Crystallization studies from the glassy and molten states were undertaken to determine the phase transformation and kinetics associated with the formation of 2212 and other competing phases. Crystallization of nominal 2212 glasses was found to proceed in two steps with the formation of Bi2Sr(sub 2-x)Ca(sub x)CuO(sub y) (2201) and Cu2O followed by Bi2Sr(sub 3-x)Ca(sub x)O(sub y), CaO, and SrO. The 2212 phase converts from the 2201 phase with increasing temperatures. However, its formation below 800 C was kinetically limited. At 800 C and above, a nearly full conversion to the 2212 phase was achieved after only one minute although considerably longer anneal times were necessary for the system to reach equilibrium. In low oxygen partial pressures, the solidus is reduced to approximately 750 C. Solidification studies revealed an eutectic structure separating the incongruently melting 2212/2201 phases at high oxygen partial pressures from the congruently melting Bi2Sr(sub 3-x)Ca(sub x)O(sub y) (23x) and Bi2Sr(sub 2-x)Ca(sub x)O(sub y) (22x) phases present at low oxygen partial pressures. During solidification in various oxygen partial pressures, the separation of CaO in the melt and the initial crystallization of alkaline-earth cuprates leaves behind a Bi-rich liquid from which it is impossible to form single-phase 2212. Hence, significant amounts of 2201 were also present in these samples. These problems could be reduced by melt processing in inert atmospheres. Bulk 2212 material produced in this manner was found to possess high transition temperatures, high intergranular critical current densities below 20K, and modest critical current densities at 77K. GIANT MAGNETORESISTANCE AND MICROSTRUCTURAL CHARACTERISTICS OF EPITAXIAL Fe-Ag AND Co-Ag GRANULAR THIN FILMS
N. Thangaraj, C. Echer, K. M. Krishnan, R. F. C. Farrow, R. F. Marks, and S. S. P. Parkin Oct. 1993 14 p Presented at the 38th Annual Conference on Magnetism and Magnetic Materials, Minneapolis, MN, 15-18 Nov. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC03-76SF-00098)
(DE94-006287; LBL-34587; CONF-931133-7) Avail: CASI HC A03

The microstructure and magnetic properties of phase-separated Fe-Ag and Co-Ag granular alloy films, grown epitaxially on NaCl (001) substrates and exhibiting giant magnetoresistance (GMR), have been investigated. Surprisingly, two Fe-Ag films of similar composition grown under identical conditions are found to have substantially different microstructures yet display similar GMR. The microstructure of these films is characterized by Fe-rich or Co-rich regions respectively, 350 to 700 nm in extent, surrounded by a Ag-rich matrix. Within the Ag-rich regions, the Fe concentration varies from 20 to 25 atomic percent and the Co concentration is approximately equal to 16 atomic percent. Within these regions essentially pure fcc Co particles and bcc Fe particles are in parallel and rotated epitaxial alignment respectively with the fcc silver matrix. The Co and Fe particles are approximately 15 to 25 A in diameter. It is these small particles which most likely account for the giant magnetoresistance exhibited by these alloys. This suggests that a size distribution of magnetic particles, sharply peaked at the optimum size with limited bulk segregation, might give rise to larger GMR values. DOE

FULLERENES AS PRECURSORS FOR DIAMOND FILM GROWTH WITHOUT HYDROGEN OR OXYGEN ADDITIONS
D. M. Gruen, S. Liu, A. R. Krauss, J. Luo, and X. Pan Oct. 1993 14 p
(Contract W-31-109-eng-38)
(DE94-004582; ANL/CHM/PP-81072) Avail: CASI HC A03/MF A01

Diamond films are predominantly grown using one percent or so of a hydrocarbon precursor in hydrogen gas. Hydrogen is generally believed to be necessary for the diamond thin film growth process. However, hydrogen in varying amounts is inevitably incorporated in the growing diamond lattice, leading to structural defects. The authors report here for the first time the successful growth of diamond films using fullerene precursors in an argon

microwave plasma, a unique development achieved without the addition of hydrogen or oxygen. It is speculated that collisional fragmentation of C60 to give C2 could be responsible for the high growth rate of the very fine grained diamond films. DOE

D. W. Yarbrough, R. K. Williams, and D. R. Shockley 1993 15 p Presented at the 22nd International Thermal Conductivity Conference, Tempe, AZ, 7-10 Nov. 1993
(Contract DE-AC05-84OR-21400)
(DE94-004796; CONF-9311131-2) Avail: CASI HC A03/MF A01

Thermal conductivities, electrical resistivities, and Seebeck coefficients of three polycrystalline YBa2Cu3O(7-x) specimens have been measured over the temperature range 80 to 300 K in a longitudinal-heat-flow apparatus. Smoothed values for thermal conductivity, and electrical resistivity have been obtained for temperatures above the superconducting transition temperature of 90 K. The thermal conductivity values decreased as the temperature was increased, a trend which is inconsistent with the results of some other investigators. The thermal conductivities were less than previously published values and it is suggested that these differences are due to radiative heat loss in the published values. This effect is especially important for linear heat flow measurements on low thermal conductivity materials. The electrical and thermal conductivities of the specimens varied with Ba content and this variation was used to separate the thermal conductivity into lattice and electronic components are significant. The phonon component exhibits the expected temperature variation and an analysis indicates that the electron-phonon interaction is unusually strong. DOE

IONIC CONDUCTION MECHANISMS IN CaF2 AND CaF2-Al2O3 NANOCOMPOSITE FILMS ON Al2O3 SUBSTRATES
F. A. Modine, D. Lubben, and J. B. Bates Nov. 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-004792; CONF-931108-40) Avail: CASI HC A02/MF A01

Thin films of pure CaF2 and nanocomposite mixtures of Al2O3 with CaF2 were sublimated on Al2O3 substrates. Interdigital electrodes allowed in situ measurements of the electrical conduction vs thickness, deposition rate, composition, time, and temperature. Conductivity in pure CaF2 adjacent to an Al2O3 interface sometimes exceeded the bulk CaF2 conductivity (i.e., value at more than 50 nm distance) by as much as a factor of 6700 at 200 C. The high conductivity is characterized by an activation energy of 0.6 +/- 0.1 eV, significantly lower than about 1.0 eV for bulk conduction. However, this high conductivity is thermally unstable and diminishes in time. A high but stable conductivity was obtained in CaF2 films containing about 10 mole percent Al2O3 as a dispersed second phase. At 200 C, a 2-phase film gave a factor of 360 enhancement over the measured bulk CaF2 conductivity and a factor of 7 improvement over the best previously reported conductivity for CaF2-Al2O3 composite materials. The origin of enhanced conduction in CaF2 is attributed to ion transport along dislocations. Dislocations anneal with a characteristic log of time dependence that is recognizable in the annealing behavior of the electrical conductivity. Presumably, the addition of a dispersed second phase of Al2O3 to CaF2 serves both to generate and to pin dislocations; the electrical conductance is thereby enhanced and stabilized. DOE

NONLINEAR OPTICS RESPONSE OF SEMICONDUCTOR QUANTUM WELLS UNDER HIGH MAGNETIC FIELDS
D. S. Chemla Jul. 1993 28 p Presented at the International School of Physics Enrico Fermi Conference, Varenna, Italy, 20-30 Jul. 1993
(Contract DE-AC03-76SF-00098)
(DE94-003244; LBL-34434; CONF-9307156-1) Avail: CASI HC A03/MF A01

Recent investigations on the nonlinear optical response of semiconductor quantum wells (QW's) in a strong perpendicular magnetic field, H, are reviewed. After some introductory material, the evolution of the linear optical properties of GaAs QW's as a function of H is discussed; an examination is made of how the magneto-excitons (MX) extrapolate continuously between quasi-2D QW excitons (X) when H = 0, and pairs of Landau levels (LL) when H (yields) (infinity). Next, femtosecond time resolved investigations of their nonlinear optical response are presented; the evolution of MX-MX interactions with increasing H is stressed. Finally, as the dimensionality is reduced by application of H, the number of scattering channels is limited and relaxation of electron-hole pairs is affected. How nonlinear optical spectroscopy can be exploited to access the relaxation of angular momentum within magneto-excitons is also discussed. DOE

NUCLEAR MAGNETIC RELAXATION STUDIES OF SEMICONDUCTOR NANOCRYSTALS AND SOLIDS Ph.D. Thesis
J. R. Sachleben (California Univ., Berkeley.) Sep. 1993 145 p
(Contract DE-AC03-76SF-00098)
(DE94-006301; LBL-34884) Avail: CASI HC A07/MF A02

Semiconductor nanocrystals, small biomolecules, and C-13 enriched solids were studied through the relaxation in NMR spectra. Surface structure of semiconductor nanocrystals (CdS) was deduced from high resolution H-1 and C-13 liquid state spectra of thiophenol ligands on the nanocrystal surfaces. The surface coverage by thiophenol was found to be low, being 5.6 and 26% for nanocrystal radii of 11.8 and 19.2 angstrom. Internal motion is estimated to be slow with a correlation time greater than 10(exp -8) s(exp -1). The surface thiophenol ligands react to form a dithiophenol when the nanocrystals were subjected to O2 and ultraviolet. A method for measuring (N-14)-(H-1) J-couplings is demonstrated on pyridine and the peptide oxytocin; selective 2D T(sub 1) and T(sub 2) experiments are presented for measuring relaxation times in crowded spectra with overlapping peaks in 1D, but relaxation effects interfere. Possibility of carbon-carbon cross relaxation in C-13 enriched solids is demonstrated by experiments on zinc acetate and L-alanine. DOE

MAGNETOTRANSPORT MEASUREMENTS IN MAGNETIC FIELDS UP TO 50T IN SmB6 AND FeSi
A. Lacerda, T. Graf, J. L. Sarrao, D. Mandrus, M. F. Hundley, J. D. Thompson, Z. Fisk, and L. VanBockstal 31 Dec. 1993 9 p Presented at the Strongly Correlated Electron Materials, Los Alamos, NM, 15-18 Dec. 1993
(Contract W-7405-eng-36)
(DE94-006227; LA-UR-94-40; CONF-931247-6) Avail: CASI HC A02/MF A01

We have measured the transverse magnetoresistance in high-quality single-crystalline samples of SmB6 and FeSi at 4K in applied magnetic fields to 50T and in the temperature range 4K less than T less than 150K in magnetic fields to 18T. The magnetoresistance in SmB6 at 4K decreases quadratically and reaches about -45% at 50T. The compound FeSi reveals three distinct features in the magnetoresistance: a negative magnetoresistance for fields below 5T, a kink at around 10T, and a broad maximum near 30T. DOE

CALCULATING THE J(c), B, T SURFACE FOR COMMERCIAL NIOBIUM TIN CONDUCTORS USING A REDUCED STATE MODEL
M. A. Green Jul. 1993 7 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract DE-AC03-76SF-00098)
(DE94-006296; LBL-35001; CONF-930703-44) Avail: CASI HC A02/MF A01

This report presents a method for calculating the J(sub c), B, T critical surface for commercial grade niobium tin given an effective (Tc) and B(sub c2) and J(sub c) over a range of magnetic inductions B. Given the effective (Tc) and B(sub c2) and J(sub c), one can estimate the J(sub c) over a range of magnetic inductions from 0.1 T to 0.8 times effective B(sub c2) and a range of temperatures from 1.5 K to about 14 K. The effects of conductor strain can also be estimated using the method. A comparison between calculated values of J(sub c) and measurements is illustrated for a number of cases. The method presented in this report can be used to estimate the performance of niobium tin in magnets at temperatures different

from those where measured data is available. The method of calculating the J(sub c) can also be used to estimate the effects of superconductor magnetization on the field quality at low fields. DOE

SYNTHESIS OF (SiC)3N4 THIN FILMS BY ION IMPLANTATION
C. Uslu, D. H. Lee, Y. Berta, B. Park, N. N. Thadhani, and D. B. Poker 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC05-84OR-21400)
(DE94-006311; CONF-931108-74) Avail: CASI HC A02/MF A01

We have investigated the synthesis of carbon-silicon-nitride compounds by ion implantation. In these experiments, 100 keV nitrogen ions were implanted into polycrystalline (beta)-SiC (cubic phase) at various substrate temperatures and ion doses. These thin films were characterized by x-ray diffraction with a position-sensitive detector, transmission electron microscopy with chemical analysis, and Rutherford backscattering spectroscopy. The as-implanted samples show a buried amorphous layer at a depth of 170 nm. Peak concentration of nitrogen saturates at approximately 45 at. % with doses above approximately 9.0 times 10(sup 17) N/sq cm at 860 C. These results suggest formation of a new phase by nitrogen implantation into (beta)-SiC. DOE

A SOLID-ON-SOLID INVASION PERCOLATION MODEL FOR SELF-AFFINE INTERFACES
C. M. Arizmendi (La Plata Univ., Argentina.), H. O. Martin, and J. R. Sanchez Aug. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608102; IC-93/273) Avail: CASI HC A02 (US Sales Only)

The scaling properties of the interface of a new growth model are studied. The model is based on the standard invasion percolation without trapping in which the solid-on-solid condition is imposed. The local correlation between points of the interface can be controlled through a parameter. The self-affine properties of the interface show strong dependence on the existence of the local correlation. The dependence of the relevant exponents of the interface with the correlation is analyzed. DOE

Development of damage structure produced in (100) GaAs/Al(0.6)Ga(0.4)As/GaAs by 1 MeV Kr(+) ion irradiation at 77 and 293 K was investigated by RBS channeling and cross-sectional high-resolution TEM techniques. Following an implantation to a dose of 10(exp 14) ions CM(sup -2) at 77 K, RBS channeling spectra indicate that the Al(0.6)Ga(0.4)AS layer contained a high defect density and was possibly amorphous. Warming to room temperature resulted in a change in the channeling spectrum, which indicated that the damage in the Al(0.6)Ga(0.4)As layer had partially recovered. The degree of recovery was greatest at the GaAs/Al(0.6)Ga(0.4)As interface, and decreased with increasing depth. TEM observations show the damage in the Al(0.6)Ga(0.4)As to be comprised of planar defects, the density of which increases with depth, and an amorphous layer at the bottom interface. This difference in the damage distribution is consistent with the asymmetry in the channeling spectrum. A model based on the depth variation of cascade density is proposed to account for the observations. DOE

Zintl compounds of lead and tin with the heavier alkali metals are semiconductors with surprising and unusual properties in both solid and liquid states. These are ascribed to the formation of tetrahedral complex anions arising from charge transfer and covalent bonding around the polyvalent metal ions. The tetrahedra exhibit both rotational and translational order, leading to a variety of complex dynamical behaviors in both solid and liquid phases. The changes in order have dramatic effects on electrical transport properties. DOE

INTRA- VERSUS INTERLAYER PAIRING IN THE COPPER OXIDE SUPERCONDUCTORS: RESPONSE TO A MAGNETIC FIELD
R. A. Klemm and Samuel H. Liu Jan. 1994 14 p Presented at the Superconducting Superlattices and Multilayers and Oxide Superconductory Physics and Nanoengineering, Los Angeles, CA, 23-28 Jan. 1994
(Contracts W-31-109-eng-38; DE-AC05-84OR-21400)
(DE94-005475; ANL/MSD/CP-78012; CONF-940121-2) Avail: CASI HC A03/MF A01

We have investigated the response of layered superconductors to an external magnetic field using the semiclassical phase approximation. The linearized-gap equations have been derived, and solved numerically to calculate the upper critical field H(sub c2)(T) for layered superconductors with one or two layers per unit cell for both s-wave and interlayer BCS-like pairing mechanisms. In the weak-hopping limit the equations reduce to the Lawrence-Doniach form, and for general hopping the appropriate gap equations are derived and numerically analyzed. One encounters the familiar dimensional crossover in the H(sub c2)(parallel)(T) curve for weak hopping. A different type of dimensional crossover can occur in the two-layer case with unequal intralayer or interlayer coupling strengths, such that at the dimensional crossover temperature, the magnetic field suppresses the superconductivity in the weakly coupled layers while leaving the strongly coupled layers superconducting. The effect is enhanced by unequal hopping strengths. The flux lattice consists of alternating superconducting and normal layers. DOE

RHEED STUDIES OF THE NUCLEATION, GROWTH, AND MOBILITY OF Ag ATOMS ON THE Si(111)7 X 7 SURFACE Ph.D. Thesis
K. R. Roos Jul. 1993 98 p
(Contract W-7405-eng-82)
(DE94-005551; IS-T-1664) Avail: CASI HC A05/MF A02

The low temperature and flux dependent growth of ultrathin Ag films on the Si(111)7x7 surface is studied with Reflection High-Energy Electron Diffraction (RHEED). The grazing incidence geometry of RHEED allows for an incident molecular beam normal to the surface and makes it an ideal surface probe for studying ultrathin film growth in real time. Short-lived oscillations in the diffracted intensity are observed during Ag deposition at 150 K, indicating quasi-layer-by-layer growth mediated by adatom mobility. When the 150 K growth is performed over a wide range of deposition rates F, the peak intensity is observed to scale, i.e. I(Ft) depends only on the total amount deposited, which implies thermally activated diffusion is absent at 150 K. Scaling is not obeyed at higher temperatures (T greater than or equal to 473 K) for the growth of the particular superstructure. Testing for scaling of the diffracted intensity constitutes a new experimental method which can be applied generally to determine if thermal diffusion is active at a particular temperature. Scaling is consistent with a constant diffusion length R(sub 0), independent of substrate temperature and deposition rate. The presence of a non-thermal diffusion mechanism is confirmed by monitoring the flux dependence of the (radical)3 superstructure growth during deposition at T greater than or equal to 473 K. At these temperatures the total diffusion length R is given by R = R(sub 0)+(4Dt)(sup 1/2), where (4Dt)(sup 1/2) is the thermal component. A non-zero intercept R(sub 0) is found by plotting the peak intensity I(sub p)(exp 1/2) vs. deposition rate F(exp -1/2) (F(exp -1) is proportional to the available diffusion time). From the FWHM of a low coverage (0.2 ML) (radical)3 spot, an estimation of 50 (angstrom) is made for a lower bound of the magnitude of R(sub 0). DOE

INFLUENCE OF SURFACE DEFECTS AND LOCAL STRUCTURE ON OXYGENATE REACTION PATHWAYS OVER METAL OXIDE SURFACES
D. F. Cox Jul. 1993 10 p
(Contract DE-FG05-90ER-14129)
(DE94-005680; DOE/ER-14129/3) Avail: CASI HC A02/MF A01

Complete thermal desorption and photoemission studies of seven molecules (methanol, formaldehyde, formic acid, isopropanol, acetone, water, and carbon monoxide) were completed on four different SnO2(110) surfaces (stoichiometric, reduced, slightly-defective, and highly-defective). Initial thermal desorption studies of acetic acid and propene were also done. Results indicate that different initial surface conditions can dramatically affect: (1) probability for heterolytic dissociation of Bronsted acids, (2) reaction kinetics for unimolecular decomposition of oxygenated surface intermediates, and (3) product selectivity. (DE94-606342; JINR-E-5-92-395) Avail: CASI HC A03 (US Sales Only)

An abstract infinite-dimensional Hamiltonian system recently introduced by M. Grillakis, J. Shatah and W.A. Strauss is considered. A lot of nonlinear evolution equations of the mathematical physics may be represented in that form. The aim of the paper is the construction of an invariant measure for this system. This measure has many applications in the theory of dynamical systems. In particular, the conditions for the finiteness of the constructed measure are presented. It makes it possible to apply the Poincare recurrence theorem which explains the well-known Fermi-Past-Ulam phenomenon of the return of any solution to its initial data with time with an arbitrary accuracy. THE INFLUENCE OF WALL CONDUCTIVITY OF FILM CONDENSATION WITH INTEGRAL FIN TUBES M.S. Thesis
Robert L. Cobb 23 Sep. 1993 263 p
(AD-A275503) Avail: CASI HC A12/MF A03

Heat transfer performance of steam condensing on horizontal finned tubes made of copper, aluminum, copper nickel (90/10), and stainless steel (316) was studied using a condenser test rig at both vacuum and atmospheric conditions. Integral fin tubes included conventional rectangular shaped fins as well as rectangular fins having a radiussed root geometry (i.e., a fillet radius equal to half the fin spacing). All finned tubes had inner and outer diameters of 12.70 mm and 15.88 mm respectively, and had a fin thickness of 1.0 mm and a fin spacing of 1.5 mm. The overall heat transfer coefficient, U(sub o), was determined experimentally and the outside heat transfer coefficient, h(sub o), was obtained utilizing a modified Wilson plot procedure. Results indicate that the performance of a finned tube was strongly dependent on the tube material and weakly dependent on fin geometry. Radiussing the fin root to remove condensate between fins in the unflooded portion (i.e., top portion) of a finned tube reduced the heat transfer performance compared to a conventional rectangular shaped integral fin. Experimental data were compared to the models of Beatty and Katz as well as to a modified model of Rose. DTIC

THE PROPER FIELD OF CHARGES AND GAUGE-INVARIANT VARIABLES IN ELECTRODYNAMICS
S. V. Shabanov 1992 18 p
(DE94-606405; JINR-E-2-92-136) Avail: CASI HC A03/MF A01 (US Sales Only)

According to Dirac it follows from the gauge invariance requirement for physical dynamical variables in electrodynamics that charges are created and annihilated together with their proper (Coulomb) field that induces the static (Coulomb) interaction of charges. It is shown that in electrodynamics there is an infinite number of ways to determine gauge-invariant variables. The proper field configuration of charges depends on the choice of these variables and may differ from the Coulomb one. DOE

THREE FORMS OF RELATIVITY
V. N. Streltsov 1992 6 p
(DE94-606338; JINR-D-2-92-63) Avail: CASI HC A02/MF A01 (US Sales Only)

The physical sense of three forms of relativity is discussed. The first, instant form, corresponds to the traditional approach based on the concept of instant distance. The normal form corresponds to the radar formulation which is based on the light or retarded distances. The front form in the special case is characterized by 'observable' variables, and the known method of k-coefficient is its obvious expression. DOE

TWISTOR-LIKE TYPE 2 SUPERSTRING AND BOSONIC STRING
V. V. Chikalov and A. I. Pashnev 1992 11 p
(DE94-606339; JINR-E-2-92-337) Avail: CASI HC A03/MF A01

The superfield formulation of type 2 Green-Schwarz superstring with n = (1,0) world-sheet supersymmetry is constructed. It is shown that the inclusion of the second spinor coordinate in the target superspace leads to the possibility of the reparametrization invariant description of the superstring in the absence of any field from the two-dimensional supergravity multiplet. The twistor-like action of Chern-Simons type for bosonic string in D = 3, 4, 6, 10 is deduced from the superstring action. DOE

THE MAXIMUM ENTROPY APPROACH APPLIED TO ENERGY EXCHANGE, CHEMICAL REACTIONS AND IONISATION IN THE DIRECT SIMULATION MONTE CARLO METHOD FOR RAREFIED HYPERSONIC FLOWS

Michael A. Gallis and John K. Harvey Jul. 1993 28 p
(ISSN 0308-7247)
(IC-Aero-93-01; ETN-94-95508) Avail: CASI HC A03/MF A01

The Maximum Entropy (ME) method, pioneered for use by chemists, was applied to the direct simulation Monte Carlo method for rarefied hypersonic ionized flow. The method was used to model the reaction rates and the disposal of post collision energy for the predominant reactions occurring in a nitrogen/oxygen flow. Unlike the commonly used Borgnakke and Larsen approach the ME method does not assume equilibrium for the distribution of energy states before or after the collisions but it calculates the most probable distribution based on the entropy associated with each distribution. Two flow field examples are presented: a plane shock wave and the axisymmetric flow about spherically blunted cone. These examples illustrate the application of the ME model for reaction between neutral and ionized species in situations of high chemical and thermodynamic nonequilibrium. ESA

COHERENT STATES OF SU(L,1) GROUPS

D. M. Gitman (Sao Paulo Univ., Brazil.) and A. L. Shelepin (MIRA, Moscow, Russia.) Jul. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-603654; IC-93/212) Avail: CASI HC A03 (US Sales Only)

This work can be considered as a continuation of our previous one (J. Phys., 26 (1993) 313), in which an explicit form of coherent states (CS) for all SU(N) groups was constructed by means of representations on polynomials. Here we extend that approach to any SU(l,1) group and construct explicitly corresponding CS. The CS are parametrized by dots of a coset space, which is, in that particular case, the open complex ball CD(sup l). This space together with the projective space CP(sup l), which parametrizes CS of the SU(l + 1) group, exhaust all complex spaces of constant curvature. Thus, both sets of CS provide a possibility for an explicit analysis of the quantization problem on all the spaces of constant curvature. That is a reason why CS of the SU(N) and SU(l,1) groups are of importance in connection with the quantization theory. The CS constructed form an overcompleted system in the representation space and, as quantum states, possess of a minimum uncertainty, they minimize an invariant dispersion of the quadratic Casimir operator. The classical limit is investigated in terms of symbols of operators; the limit of the so called star commutator of the symbols generates the Poisson bracket in CD(sup l), the latter plays the role of the phase space for the corresponding classical mechanics. ANOMALOUS ALGEBRAIC STRUCTURES IN QUANTUM FIELD THEORIES Ph.D. Thesis

Wen-Xin Jiang 1992 84 p
Avail: Univ. Microfilms Order No. DA9315219

In this thesis we will investigate the anomalous algebraic structures (the Schwinger terms and their equivalents) in quantum field theories, especially those with higher than two space time dimensions. The universal behavior of the c-number Schwinger terms in higher than two dimensional conformal field theories are discussed, for both the current algebra and the stress-energy tensor algebra. Operational extensions for spatial diffeomorphisms and gauge transformations in the physical space time are also discussed. We also use the anomalous Ward identities to establish a relation between the consistent gravitational anomaly and the Schwinger terms for the gravitational constraint algebras. Dissert. Abstr.

A SEMICLASSICAL STUDY OF QUANTUM MAPS Ph.D. Thesis

Yin Guo 1992 127 p
Avail: Univ. Microfilms Order No. DA9315647

The study of the behavior of quantum systems whose classical limit exhibits chaos defines the problem of quantum chaos. Because of some strongly contrasting properties exhibited by classical and quantum theories, one would naturally ask how quantum mechanics approaches the classical limit h = 0, and how the chaotic motion in classical systems manifests itself in the corresponding quantum counterparts. Semiclassical mechanics is the bridge between these two fundamental frameworks: quantum mechanics and classical mechanics. For studying the quantum mechanics corresponding to generic classical motion it is desirable to use the simplest possible model. The model system we use is the kicked rotator, which is one of the most studied model systems due to its simplicity and generic features. Detailed computations of both classical and quantum mechanics are feasible for this system. The relationship between invariant classical phase space structures and quantum eigenfunctions has been the focus of recent semiclassical studies. We study the eigenstates of the quantum standard map associated with both integrable and nonintegrable regions in classical phase space. The coherent-state representation is used to make the correspondence between the quantum eigenstates and the classical phase space structure. The importance of periodic orbits in the quantum eigenstates of classically chaotic Hamiltonians has become a popular topic in study of semiclassical limits of the systems. It is well known that periodic orbits arise without any assumption in the trace formula developed by Gutzwiller. We calculate the semiclassical coherent-state propagator. Since computing all the complex stationary orbits is not practical, we make a further assumption which we call the periodic point dominance (PPD). We present arguments and evidence to show that the PPD approximation works well in hard chaos regions where the full semiclassical approximation is not practical to use. The method fails in some boundary regions where both stable and unstable points are present, but the full semiclassical approximation is not a much better method than the PPD in many of this kind of situations. Dissert. Abstr.

ON CHAOS IN QUANTUM MECHANICS: THE TWO MEANINGS OF SENSITIVE DEPENDENCE

R. L. Ingraham (New Mexico State Univ., Las Cruces.) and G. A. Luna-Acosta Aug. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608069; IC-93/270) Avail: CASI HC A02 (US Sales Only)

Sensitive dependence on initial conditions, the most important signature of chaos, can mean failure of Lyapunov stability, the primary meaning adopted in dynamical systems theory, or the presence of positive Lyapunov exponents, the meaning favored in physics. These are not equivalent in general. We show that there is sensitive dependence in quantum mechanics in the sense of violation of Lyapunov stability for maps of the state vector like /A/ involving unbounded operators A. This is true even for bounded quantum systems, where the corresponding Lyapunov exponents are all zero. Experiments to reveal this sensitive dependence, a definite though unfamiliar prediction of quantum mechanics, should be devised. It may also invalidate the usual assumption of linear response theory in quantum statistical mechanics in some cases. DOE

It is shown what perturbation is required to variate the normalizing constants of the chosen levels and to shift separate energy levels in the rectangular well for the finite-difference Schroedinger eq. Peculiarities are found of the discrete case in comparison with the equation of motion with the continuous coordinate. The ordinary potential parameters v(sub n) (diagonal) determine the shape of the lower boundary of the allowed zone, and the u(sub n) on the neighbor diagonals determine the width of the zone. The different influence of v(sub n) and u(sub n) on the shifts of the energy levels in the rectangular well is clarified. The v pushes in one direction the levels symmetrically posed according to the middle of the spectrum, and u(sub n) pushes them in opposite directions. DOE

EXCLUSIVE MANY-PARTICLE DIFFUSION IN DISORDERED MEDIA AND CORRELATION FUNCTIONS FOR RANDOM VERTEX MODELS
G. Schuetz and S. Sandow May 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608134; WIS-PH-93-46) Avail: CASI HC A03 (US Sales Only)

We consider systems of particles hopping stochastically on d-dimensional lattices with space-dependent probabilities. We map the master equation in a Fock space where the dynamics are given by a quantum Hamiltonian (continuous time) or a transfer matrix (discrete time). We show that under certain conditions the time-dependent two-point density correlation function in N-particle steady state can be computed from the probability distribution of a single particle moving in the same environment. Focusing on exclusion models where the lattice site can be occupied by at most one particle, we discuss as an example for such a stochastic process a generalized Heisenberg antiferromagnet where the strength of the spin-spin coupling is space-dependent. In discrete time one obtains for one dimensional systems the diagonal-to-diagonal transfer matrix of the two dimensional six vertex model with space dependent vertex weights. For a random distribution of the vertex weights one obtains a version of the random barrier model describing diffusion of particles in disordered media. We derive exact expressions for the average two-point density correlation function in the presence of weak, correlated disorder. DOE

CURVED-SPACE QUANTIZATION, AND DIRAC VERSUS REDUCED QUANTIZATION OF POINCARE GAUGE THEORIES Ph.D. Thesis
Richard J. Epp Nov. 1993 161 p
(ISBN-0-315-85990-3; CTN-94-61176) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

It is well known that the difference between Dirac and reduced quantization of gauge theories can be understood in terms of factor ordering ambiguities. The presence of symmetries such as Poincare invariance leads to restrictions on the possible factor orderings. Scalar electrodynamics is considered: its reduced field space is curved, which amplifies the van Hove obstructions and obscures the correct factor ordering of the Poincare generators. In Dirac quantization, however, the initial field space on which the quantum operators are defined, is flat. It is shown that the natural factor ordering automatically realizes the Poincare algebra on physical states. This result is generalized to a broader class of observables and gauge theories. Kaluza Klein-like geometric methods are applied to determine what if anything makes the Dirac factor ordering special. Unlike reduced quantization, remarkable similarities are discovered between Dirac quantization on the physical state space and other curved space quantization schemes. Nevertheless, the Dirac factor ordering retains some dependence on the gauge structure of the theory; it could not have been guessed working strictly within the classical reduced theory. This sheds new light on the Dirac versus reduced quantization debate, as well as curved space quantization in general. Author (CISTI)

THEORY OF FUNDAMENTAL INTERACTIONS
A. B. Pestov 1992 52 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608126; JINR-E-2-92-537) Avail: CASI HC A04 (US Sales Only)

The theory of fundamental interactions is derived in a systematic way from the first principles. In the developed theory, there is no separation between space-time and internal gauge space. Main equations for basic fields are derived. In is shown that the theory satisfies the correspondence principle and gives rise to new notions in the considered region. In particular, the conclusion is made about the existence of particles which are characterized not only by the mass, spin, charge but also by the moment of inertia. These are rotating particles, the particles which represent the notion of the rigid body on the microscopical level and give the key for understanding strong interactions. The main concepts and dynamical laws for these particles are formulated. The basic principles of the theory may be examined experimentally not in the distant future. DOE

PROCEDURES FOR BASIC INVERSE PROBLEMS: BLACK BODY RADIATION PROBLEM AND PHONON DENSITY OF STATES PROBLEM M.S. Thesis
Lixin Dou 1992 96 p
(ISBN-0-315-85757-9; CTN-94-61163) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The regularization method and the maximum entropy method are investigated and developed to solve some basic inverse problems in theoretical physics. Both of these numerical procedures are applied to the inverse black body radiation problem, concerned with the determination of the area temperature distribution of a black body source from spectral measurements of its radiation, and the inverse phonon density of states problem, which is defined to be the determination of the phonon density of states function from the measured lattice specific heat function at constant volume. These problems are ill-posed and can be expressed as a Fredholm integral equation of the first kind. It appears that both the regularization method and the maximum entropy method are successful in solving the two ill-posed problems. Generally, the two procedures can be applied to any inverse problem which belongs to the class of the Fredholm integral

equation of the first kind. A comparison with the two procedures to the Laplace transform method demonstrates the superiority of the regularization and maximum entropy methods. Author (CISTI)

THERMODYNAMICS OF COMPUTATION AND INFORMATION DISTANCE
Charles H. Bennett (International Business Machines Corp., Yorktown Heights, NY.), Peter Gacs (Boston Univ., MA.), Ming Li (Waterloo Univ., Ontario.), Paul M. R. B. Vitanyi (Amsterdam Univ., Netherlands.), and Wojciech H. Zurek (Los Alamos National Lab., NM.) Jun. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract NF-62-376; NSF CCR-90-02614; NSERC-OGP-046506; NSERC-ISE-0046203) (ISSN 0169-118X)
(CWI-CS-R9341; ETN-94-95683) Copyright Avail: CASI HC A03

Intuitively, the minimal information distance between x and y is the length of the shortest program for a universal computer to transform x into y and y into x. This measure is shown to be, up to a logarithmic additive term, equal to the maximum of the conditional Kolmogorov complexities E(sub 1)(x,y) = max(K(y/x), K(x/y)). Any reasonable distance to measure similarity of pictures should be an effectively approximable, symmetric, positive function of x and y satisfying a reasonable normalization condition and obeying the triangle inequality. It turns out that E(sub 1) is minimal up to an additive constant among all such distances. Hence it is a universal 'picture distance', which accounts for any effective similarity between pictures. A third information distance, based on the ideal that the aim should be for dissipationless computations, and hence for reversible ones, is given by the length E(sub 2)(x,y) = KR(y/x) = KR(x/y) of the shortest reversible program that transforms x into y and y into x on a universal reversible computer. It is shown that also E(sub 2) = E(sub 1), up to a logarithmic additive term. It is remarkable that three so differently motivated definitions turn out to define one and the same notion. Another information distance, E(sub 3), is obtained by minimizing the total amount of information flowing in and out during a reversible computation in which the program is not retained, in other words the number of extra bits (apart from x) that must be irreversibly supplied at the beginning, plus the number of garbage bits (apart from y) that must be irreversibly erased at the end of the computation to obtain a 'clean' y. This distance is within a logarithmic additive term of the sum of the conditional complexities, E(sub 3)(x, y) = K(y/x) + K(x/y). Using the physical theory of reversible computation, the simple difference K(x) - K(y) is shown to be an appropriate (universal, antisymmetric, and transitive) measure of the amount of thermodynamic work required to transform string x into string y by the most efficient process. AN INVESTIGATION INTO CERTAIN GEOMETRICAL AND VARIATIONAL PROPERTIES OF THE P(4) THEORY OF GRAVITATION AND ELECTROMAGNETISM Ph.D. Thesis
Jimmie Herbert Chilton 1993 140 p
Avail: Univ. Microfilms Order No. DA9326983

We propose a Lagrangian for the P(4) theory of gravitation and electromagnetism which is a straightforward generalization of the Einstein Lagrangian of general relativity. A constrained Palatini variation of this Lagrangian yields the Einstein-Maxwell affine field equations. The Lagrangian is extended to account for electric, magnetic and matter sources. Also examined are the conservation laws arising from the invariance properties of the Lagrangian. A generalization of this Lagrangian of the Born-Infeld type is proposed with the goal of producing a P(4) theory of the classical electron which avoids the infinite self-energy problem. The attempt is successful but in the process the analogy between the electromagnetic and gravitational sectors of the Lagrangian is weakened and a mild restriction is placed on the assumption that classical charged particles follow affine 4-momentum geodesics. The Bianchi identities for the P(4) theory are decomposed into the standard O(1, 3) Riemannian Bianchi identity plus an additional R(sup 4*) component. When combined with the Einstein-Maxwell affine field equations the R(sup 4*) component implies conservation of magnetic charge and the standard wave equation for the Maxwell field strength in a curved space time. We show that our development is the analog of the manner in which the Riemannian Bianchi identity when combined with Einstein's field equation imply conservation of stress-energy-momentum and the wave equation for the Lanczos H-tensor. The analog between the Lanczos H-tensor and the Maxwell field strength is examined in more detail by the P(4) generalization of the variational principle from which the Lancros H-tensor first arose. We construct by analogy additional terms for the Lanczos Lagrangian which are thought of as comprising the electromagnetic sector of the total Lagrangian. Variation of the total Lagrangian leads to simultaneous creation of alternative potential structures for both the gravitational and electromagnetic sectors in terms of the Lagrange multipliers which multiply the constraints to the O(1, 3) and R(sup 4*) components of the P(4) Bianchi identity. THE SEVENTH ANNUAL NATIONAL CONFERENCE OF BLACK PHYSICS STUDENTS Summary Report
Gerard M. Crawley 1993 44 p Conference held in East Lansing, MI, 12-13 Feb. 1993
(Grant NAGw-3214)
(NASA-CR-195735; NAS 1.26:195735) Avail: CASI HC A03/MF A01

The National Conference of Black Physics Students began in 1986 when several Black physics graduate students at MIT and Harvard decided to address the 'pipeline problem' of African Americans in physics by organizing a conference for Black physics undergraduates. The goals of the conference were: (1) to develop a network within the Black physics community, (2) to make Black students in physics, particularly at graduate level, aware of academic and professional opportunities and (3) to bring important issues and developments in the field to the attention of these students. We are pleased to announce the Seventh Annual National Conference of Black Physics Students held February 12 and 13, 1993 served the largest population of students so far. The largest conference previous to this one hosted 150 students. We registered and prepared for 240 students with 210 actually attenting. We received so many qualified abstracts for technical talks by students that instead of NCBPS's tradition of 3-4 student presentations, we ran 4 parallel sessions in different rooms with 4-5 presentations in each room. In response to comments from previous conferences, the program contained 3 workshop/discussion sessions. The topics for the interactive discussion workshops were: 'Getting Ready for Graduate School,' 'How to Succeed in Graduate School,' and 'Issues Facing Black Scientists.' Derived from text

RISK-BASED PRIORITIZATION: A COMPARISON OF APPROACHES
R. S. Strait Oct. 1993 6 p Presented at the 2nd Probabilistic Safety Assessment and Management Conference (PSAM), San Diego, CA, 20-24 Mar. 1994

(Contract W-7405-eng-48)
(DE94-003368; UCRL-JC-115244; CONF-940312-47) Avail: CASI HC A02/MF A01

The use of analytical techniques for risk-based prioritization, both quantitative and non-quantitative, is becoming much more wide spread and organizations are tailoring analytical techniques for risk management to their particular needs. This has led to the use of different techniques for different applications within the same organization, and correspondingly, the need for management to reconcile the process and results of different risk-based prioritization approaches. Different risk-based prioritization methods may be used to prioritize different types of activities, but eventually these prioritizations may need to be integrated to allocate organizational resources at a higher level or to develop an overall organizational budget. This paper focuses on comparing and contrasting the different risk-based approaches. The objective is to help management understand the different approaches, choose the best approach for their needs, and reconcile different approaches. DOE

SOLID-STATE, ACTIVE-PHASED ARRAYS: SOME ASPECTS OF RECEIVER DESIGN Final Report
Joseph D. Harrop Feb. 1994 142 p
(AD-A275893; NSWCDD/TR-93249) Avail: CASI HC A07/MF A02

The Navy's use of solid-state transmitter technology has been limited to communication equipment or other uses requiring relatively low power, low frequency, or both. It has now become necessary to address some of the issues and tradeoffs involved in the design of transmit/receive modules so that active phased-array characteristics can be fully understood. The analytical work performed here determines the general relationship among the system noise figure and the third-order intercept requirements of phased-array receivers and the effect on noise figure of adding receive-attenuation to implement weighting (taper) of the array elements. EFFECTS OF WORKLOAD ON COMMUNICATION PROCESSES IN DECISION MAKING TEAMS Final Report
Julie M. Urban, Clint A. Bowers, Ben B. Morgan, Jr., and Susan D. Monday 14 Dec. 1993 90 p
(AD-A275894; TR-93-01) Avail: CASI HC A05/MF A01

This report is a continuation of the research first described by Bowers and his colleagues and attempts to investigate those variables which, according to a broad model of team performance, might contribute to a more thorough understanding of team decision making. While the goal of the previous study was to determine the relative effects of two different team structures and two workload levels on team processes and performance, the current investigation incorporated a third structure into the previously employed design. The team structure that was simulated in the current study is a structure that is prevalent in organizations and operational environments, and hence, enhances generalizability to operational teams. Therefore, this report describes the evaluation of the relative performance effectiveness of these three structures under two levels of workload, as well as the identification of team coordination processes associated with effective decision making within these groups. THE MANAGEMENT ISSUES OF IMPLEMENTING TELECOMMUTING: A CASE STUDY M.S. Thesis
Chuck H. Bane, Jr. Sep. 1993 95 p
(AD-A275267) Avail: CASI HC A05/MF A01

This thesis is a case study of the implementation of telecommuting by CalComp at the Telecommuting Workcenter of Riverside County and is a real life example of the management issues that surround telecommuting. The issues brought forth in this study will enable those responsible for implementing a telecommuting program to better understand the impact of this change on their organization and how a telecommuting center may be used in their program. Using this study as background, the military use of telecommuting for U.S. Navy detailers will be developed. Developing a peace time telecommuting program could help train Navy personnel to function as a remote staff member for a Battle Group or Joint Commander. A conceptual application of telecommuting for the Department of the Navy (DON) could be to allow selected officer and enlisted detailers to telecommute up to three days a week. This insight, properly used, will help program managers avoid problems that other programs have experienced during their transition to telecommuting. This insight, properly used, will help the program managers avoid problems other programs have had during the transition to telecommuting. Recommendations for further research and use of telecommuting for the Department of the Navy are provided. DTIC

EVALUATING THE ANALYTIC HIERARCHY PROCESS AND RECOMMENDED MODIFICATIONS FOR ITS USE IN MULTI-ATTRIBUTE DECISION MAKING M.S. Thesis
William H. McQuail Sep. 1993 80 p
(AD-A275065) Avail: CASI HC A05/MF A01

The Combined Arms Analysis Directorate of the Training and Doctrine Analysis Command (TRAC) uses the Analytic Hierarchy Process (AHP) to evaluate the contribution of modernization initiatives to U.S. Army capabilities. This thesis identifies several problems with using AHP. Most significantly, AHP can cause rank reversal of alternatives if a new alternative is considered, even if the new alternative has the same attribute levels as one of the previous alternatives. This thesis proposes several modifications that would improve results when AHP is used. It contains a different method of weight fitting that appears to provide alternative weights that are more accurate than the traditional AHP eigenvalue method. This thesis has two proposals for improving the nine point integer scale by which pairwise comparisons are made. Most significantly, this thesis proposes a modification to AHP that will maintain a ratio scale and avoid rank reversals. This last improvement requires the decision maker to establish and maintain units of measurement. Additionally, the decision maker must make comparisons of attributes to establish a meaningful scale not sensitive to the abundance or lack of alternatives considered. If units are maintained and the decision maker is consistent in the pairwise comparisons, there will be no rank reversals. DTIC

TRIPLE DIAGONAL MODELING: A MECHANISM TO FOCUS PRODUCTIVITY IMPROVEMENT FOR BUSINESS SUCCESS
L. O. Levine and L. D. Villareal Sep. 1993 7 p Presented at the 2nd International Symposium on Productive and Quality Improvement with a Focus on Government, Washington, DC, 8-10 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC06-76RL-01830)
(DE94-004309; PNL-SA-21413; CONF-9309168-2) Avail: Issuing Activity (Department of Energy (DOE))

Triple Diagonal (M) modeling is a technique to help quickly diagnose an organization's existing production system and to identify significant improvement opportunities in executing, controlling, and planning operations. TD modeling is derived from ICAM Definition Language (IDEF 0)-also known as Structured Analysis and Design Technique. It has been used successfully at several Department of Defense remanufacturing facilities trying to accomplish significant production system modernization. TD has several advantages over other modeling techniques. First, it quickly does 'As-Is' analysis and then moves on to identify improvements. Second, creating one large diagram makes it easier to share the TD model throughout an organization, rather than the many linked 8 1/2 x 11 inch drawings used in traditional decomposition approaches. Third, it acts as a communication mechanism to share understanding about improvement opportunities that may cross existing functional/organizational boundaries. Finally, TD acts as a vehicle to build a consensus on a prioritized list of improvement efforts that hangs together as an agenda for systemic changes in the production system and the improved integration of support functions. BENCHMARKING FOR COST IMPROVEMENT
Sep. 1993 88 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-002276; DOE/EM-0106P) Avail: CASI HC A05

The U.S. Department of Energy's (DOE) Office of Environmental Restoration and Waste Management (EM) conducted the Benchmarking for Cost Improvement initiative with three objectives: pilot test benchmarking as an EM cost improvement tool; identify areas for cost improvement and recommend actions to address these areas; and provide a framework for future cost improvement. The benchmarking initiative featured the use of four principal methods (program classification, nationwide cost improvement survey, paired cost comparison, and component benchmarking). Interested parties contributed during both the design and execution phases. The benchmarking initiative was conducted on an accelerated basis. Of necessity, it considered only a limited set of data that may not be fully representative of the diverse and complex conditions found at the many DOE installations. The initiative generated preliminary data about cost differences and it found a high degree of convergence on several issues. Based on this convergence, the report recommends cost improvement strategies and actions. This report describes the steps taken as part of the benchmarking initiative and discusses the findings and recommended actions for achieving cost improvement. The results and summary recommendations, reported below, are organized by the study objectives.

NASA SPACE AND EARTH SCIENCE DATA ON CD-ROM
Syed S. Towheed Aug. 1993 29 p
(NASA-TM-109709; NAS 1.15:109790; NSSDC-WDC-A-R/S-93-27) Avail: CASI HC A03/MF A01

The National Space Science Data Center (NSSDC) is very interested in facilitating the widest possible use of the scientific data acquired through NASA spaceflight missions. Therefore, NSSDC has participated with projects and data management elements throughout the NASA science environment in the creation, archiving, and dissemination of data using Compact Disk-Read Only Memory (CD-ROM). This CD-ROM technology has the potential to enable the dissemination of very large data volumes at very low prices to a great many researchers, students and their teachers, and others. This catalog identifies and describes the scientific CD-ROM's now available from NSSDC including the following data sets: Einstein Observatory CD-ROM, Galileo Cruise Imaging on CD-ROM, International Halley Watch, IRAS Sky Survey Atlas, Infrared Thermal Mapper (IRTM), Magellan (MIDR), Magellan (ARCDR's), Magellan (GxDR's), Mars Digital Image Map (MDIM), Outer Planets Fields & Particles Data, Pre-Magellan, Selected Astronomical Catalogs, TOMS Gridded Ozone Data, TOMS Ozone Image Data, TOMS Update, Viking Orbiter Images of Mars, and Voyager Image.

SIMULATION NETWORKING/TRAINING REQUIREMENTS RELATIONAL DATABASE: USER'S GUIDE Final Report, Aug. 1990 - Mar. 1993
Larry L. Meliza Nov. 1993 53 p
(AD-A275634; ARI-RP-94-01) Avail: CASI HC A04/MF A01

The Simulation Networking/Training Requirements Relational Database was developed to support analyses and training research projects for applying networked simulators to collective training. The collective tasks, subtasks, and standards described in armor platoon-, company team-, and battalion task force-level Mission Training Plan (MTP) documents form the core of the database. This core is supplemented with three types of data on each of over five thousand collective performance standards. The first type of data rates the extent to which the unit can perform the activities associated with each standard in the current simulation networking (SIMNET) environment. The second type of data provides information on how each of 41 potential enhancements to SIMNET would change the extent to which units can perform activities associated with each standard. This type of data ensures the utility of the database as new generations of network simulators are fielded. The third type of data identifies the source or sources of the data required to assess whether a unit meets performance standards in the networked simulator training environment. These data sources include data broadcast over the simulation network, unit plans for performing the mission, terrain data, tactical communications, and direct observation of behavior.

SECURITY ASPECTS OF COMPUTER SUPPORTED COLLABORATIVE WORK M.S. Thesis
George V. Haroutunian, Jr. Sep. 1993 88 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275638) Avail: CASI HC A05

Computer Supported Collaborative Work (CSCW) is a topic of considerable academic inquiry and rapid commercial development. Meeting Room Systems, Conferencing Systems, Co-authoring and Argumentation Systems, Message Systems, and Autonomous Agents which support group collaboration currently exist; however, Department of Defense (DoD) computer security requirements, as they impact CSCW system design, have received little attention. This thesis describes CSCW systems and relates group dynamic issues to predict the form of the sophisticated CSCW which will probably become commonplace in the future. Next the Trusted Computer Security Evaluation Criteria (TCSEC), with which all DoD systems must comply, are synopsized. An extension of the Bell-LaPadula model underlying the TCSEC requirements is proposed which would allow 'Functionally Trusted CSCW' (FT-CSCW), CSCW which would meet many but not all of the TCSEC requirements. Possible first order (efficiency) effects of FT-CSCW, including the effect of sparse group domains, the breakdown of compartmentation, and organizational stratification are discussed. Second order (social) effects are also discussed, as are possible FT-CSCW problems (unstable group membership, attempts to implement

Quality Improvement Circles, inter-group CSCW and the effect of visitors). Finally, some suggestions are made for future FT-CSCW research. DTIC

TOWARD A MODEL OF EXPERT KNOWLEDGE STRUCTURE AND THEIR ROLE IN COGNITIVE TASK PERFORMANCE Final Report, Nov. 1989 - Jun. 1993
Richard Koubek 1 Nov. 1993 90 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1153)
(AD-A275641) Avail: CASI HC A05

This project addressed the role of knowledge structure in skilled cognitive task performance. In particular, efforts focused on four areas: identification of attributes affecting the development of knowledge structures, derivation of theoretical dimensions for the knowledge structure construct, mapping the impact of knowledge structure on task performance, and derivation of automated knowledge structure measures. This project has provided information useful for the selection and training of personnel suggesting a focus on selecting and training individuals to develop the appropriate knowledge structure. Both the type of knowledge structures and examples of effective training methods are provided. Key unanswered questions include the following: (1) the development of a comprehensive matching algorithm between particular task features and the type of knowledge structure which is best suited for these task attributes, and (2) identification of individual difference characteristics which influence the type of knowledge structure developed. A SURVEY OF GEOGRAPHICAL INFORMATION SYSTEMS APPLICATIONS FOR THE EARTH SCIENCE AND APPLICATIONS DIVISION, SPACE SCIENCES LABORATORY, MARSHALL SPACE FLIGHT CENTER
D. Rickman, K. A. Butler, and C. A. Laymon Feb. 1994 40 p
(NASA-TM-108438; NAS 1.15:108438) Avail: CASI HC A03/MF A01

The purpose of this document is to introduce Geographical Information System (GIS) terminology and summarize interviews conducted with scientists in the Earth Science and Applications Division (ESAD). There is a growing need in ESAD for GIS technology. With many different data sources available to the scientists comes the need to be able to process and view these data in an efficient manner. Since most of these data are stored in vastly different formats, specialized software and hardware are needed. Several ESAD scientists have been using a GIS, specifically the Man-computer Interactive Data Access System (MCIDAS). MCIDAS can solve many of the research problems that arise, but there are areas of research that need more powerful tools; one such example is the multispectral image analysis which is described in this document. Given the strong need for GIS in ESAD, we recommend that a requirements analysis and implementation plan be developed using this document as a basis for further investigation. Author

A PORTING METHODOLOGY FOR PARALLEL DATABASE SYSTEMS M.S. Thesis
Stanley H. Watkins Sep. 1993 97 p
(AD-A275256) Avail: CASI HC A05/MF A02

The Multibackend Database Supercomputer (MDBS) pioneered in the Naval Postgraduate School Laboratory for Database Systems Research offers an elegant solution to the four most pressing problems associated with the traditional approach to very large database management systems: capacity growth, performance improvement, data sharing, and resource consolidation. The purpose of this thesis is to develop a theory of system software portability for this large and complex network application which will facilitate others in the installation and utilization of MDBS. The first challenge is the almost total lack of documentation about MDBS software of use to system porters. A second set of issues revolves around the use of hardware by MDBS, particularly the use of mass storage devices for the storage and manipulation of base- and meta-data. A third challenge concerns the portability of system calls, shell programs, and the C language implementation. A final set of portability issues arises from the extensive use of inter-process and inter-machine communications by MDBS. DTIC

AN EVALUATION OF TECHNIQUES FOR RANKING ACADEMIC INFORMATION SYSTEMS JOURNALS M.S. Thesis
TeddiAnn S. Hayes and Winnie L. Huskey 23 Sep. 1993 68 p
(AD-A275179) Avail: CASI HC A04/MF A01

In an evolution from academic journal prestige ranking procedures used in economics, marketing, sociology and previous efforts in information systems (IS), this study developed prestige weights for IS journals based on a probability sample of 400 IS faculty in the United States and Canada. The weights are derived from subjective rankings by survey questionnaire. In addition to developing a master schedule of journal prestige weights, differences in prestige ranking are examined according to location of respondents' employing school, respondents' academic specialties within IS, types of degrees held by the respondents, and years in which respondents earned terminal degree at a graduate school with a national ranking. Characteristics of respondents are compared to nonrespondents to test the hypothesis the respondents are representative of the sample frame. Implications of the procedure developed here are discussed in terms of its application to evaluation of research productivity in DOD laboratories. DTIC

OPERATION SEMANTICS WITH READ AND WRITE FRAMES
J. C. Bicarregui Dec. 1993 21 p
(PB94-138138; RAL-93-098) Avail: Issuing Activity (National Technical Information Service (NTIS))

The read and write 'externals' clauses in VDM implicit operation definitions play two distinct roles. On the one hand, they bind the free variables that appear in the preconditions and postconditions, whilst on the other hand, they can be understood to indicate the sets of state variables that an implementation of the operation can be permitted to 'read' and 'write'. However, in the case of the read frame, existing semantic models for VDM give no formal interpretation to this latter role. This paper investigates an extension to the denotational model of operations which captures this informal understanding of the read frame. It interprets the read frame via an extra constraint on the semantics of operations which formalizes the idea that the behavior of an operation should not depend on the variables outside the read frame. This semantics is shown to justify a new formalization of the satisfiability obligation and to yield a property of non-interference between operations with sufficiently disjoint frames.

However, some difficulties remain with this approach as a means of justifying algorithm refinement with read frames the resolution of which would require more substantial changes to the semantic model. NTIS

TOWARDS AN INFORMATION MODEL AND MECHANISMS FOR DESIGN RATIONALE CAPTURE AND USE M.S. Thesis
Debra A. Morris and Tina M. Paco Sep. 1993 89 p
(AD-A275060) Avail: CASI HC A05/MF A01

Every year the Department of Defense's (DoD) expenditures on software alone amount to almost ten billion dollars, with maintenance costs comprising the majority of this figure. Recent studies have indicated that an effective solution to help curtail the large maintenance cost is by capturing the rationale which was used to create the systems requirements and designs and using this information throughout the life cycle. However, various models proposed by current research for capture of design rationale address only some specific aspects of the design process rather than the entire design process. This thesis identifies the important components of a comprehensive design rationale information model, proposes mechanisms to facilitate their capture, and identifies the generic functionalities of a design rationale management tool to use the rationale in various systems development activities. NPSNET: INTEGRATION OF DISTRIBUTED INTERACTIVE SIMULATION (DIS) PROTOCOL FOR COMMUNICATION ARCHITECTURE AND INFORMATION INTERCHANGE M.S. Thesis
Steven R. Zeswitz Sep. 1993 79 p
(AD-A275061) Avail: CASI HC A05/MF A01

The Computer Science Department at the Naval Postgraduate School in Monterey, California has developed a low-cost, real-time interactive network based simulation system, known as NPSNET, that uses Silicon Graphics workstations. NPSNET has used non-standard protocols which constrains its participation in distributed simulation. DIS specifies standard protocols and is emerging as the international standard for distributed simulation. This research focused on the development of a robust, high-performance implementation of the DIS Version 2.0.3 protocol to support graphic simulation systems (e.g. NPSNET). The challenge was to comply with the standard and minimize network latency thereby maintaining the time and space coherence of distributed simulations. The resulting DIS Network Library consists of an application program interface (API) to low level network routines, a host of network utilities, and a network harness that takes advantage of multiprocessor workstations. The library was successfully tested on our local network and two configurations of a T-I based internet, the Defense Simulation Internet (DSI), with the Air Force Institute of Technology and Advanced Research Projects Agency. The testing confirmed that the semantics and syntax of the DIS protocol is properly implemented and the latency incurred by the network does not adversely effect the simulation application. DTIC

THE COVERING PROPERTY OF THE OBJECT-ORIENTED DATA MODEL: DESIGN AND IMPLEMENTATION ISSUES M.S. Thesis
Todd G. Estes and Eric M. Mueller Sep. 1993 120 p
(AD-A275048) Avail: CASI HC A06/MF A02

Inheritance is a necessary condition for construction of an object-oriented data model (OODM), but it is not sufficient. This is because inheritance applies to only one hierarchy. The covering construct meets this deficiency because covering maps an object in one hierarchy to a class of objects in another hierarchy. To date, covering has not been implemented into an existing OODM application. This thesis implements the covering construct into a functioning object-oriented database environment. Implementation was achieved through modification of data constructs and the creation of a user-defined relation linking two or more hierarchies. Using the Multi-model Multi-lingual Database Supercomputer (MDBS), a sample, working application is described illustrating real world applications. The results of this thesis show that the covering property can be implemented into an existing OODM without sacrificing the integrity of the data model. The cross-hierarchical mapping afforded by covering is a powerful construct that expands the capabilities of the model beyond pure inheritance. This makes the OODM suitable for a far wider range of applications. Together, inheritance and covering meet the necessary and sufficient conditions of the OODM. DTIC

BATCH UPDATES AND CONCURRENCY IN B-TREES
K. Pollari-Malmi, E. Soisalon-Soininen, and T. Yloenen 1993 19 p Prepared for Suomen Akatemja, Helsinki
(PB94-136835; TKO-B106) Avail: CASI HC A03/MF A01

In many applications it is important to be able to insert (or delete) keys into a B-tree as a batch, instead of inserting them one by one. Moreover, it may be necessary to search the B-tree concurrently with the batch update. An example of this is a text database system supporting a newspaper house: all words (keys) of each article obtained from a news agency should be inserted at once, and, at the same time, searches should be allowed as efficiently as possible. We have designed two solutions to the problem of concurrent batch update. The first solution--implemented in our commercial text database system--optimizes the speed of the batch update, and the second solution optimizes the average search time during the batch update. (PB94-136934; TKO-B109) Avail: CASI HC A03

The implementation of an engineering document management system (EDMS) is described. The system models CAD drawings and other engineering documents as objects, which can be composed of subdocuments and have multiple versions and representations. Documents contain user-defined attributes and the actual data for separate CAD tools. The documents are accessed with a server program, which stores document contents and attributes in a repository built on top of a relational database. The server accepts service requests from various client programs, including a graphical user interface. Document approval and release procedures can be described by means of user-defined state graphs. Access rights are controlled in a flexible manner with an authorization program. Attributes can be treated as active data by means of procedures which enforce dependencies between attribute values. NTIS

INFORMATION ENGINEERING IMPLEMENTATION AND ACCEPTANCE Ph.D. Thesis
Michael Abellera Sobremonte 1992 81 p
Avail: Univ. Microfilms Order No. DA9311966

The purpose of this study is to determine if difficulties in Information Engineering (IE) implementation and its acceptance in an Information Systems (IS) environment are a result of inaccurate expenditure reporting, lack of top-level management support, and ineffective personnel culture change. In addition, the study aims to provide an in-depth review of the IE approach, its methodology, techniques, and tools. According to the study, inaccurate expenditure reporting is not a problem that contributes to the difficulties in implementing IE. Lack of top-level management support hinders IE implementation and acceptance indicated by 81 percent of the respondents. Culture change, or lack thereof, contributes to the difficulty in implementing IE as indicated by 94 percent of the sample population. In addition, most of the respondents from all categories have indicated their interest to train and participate in future IE workshops, seminars, and forums. Respondents acknowledged that IE is a disciplined approach to Information Systems design and development, based on stable data models and structures. IE aims to ensure correct user requirements identification at all levels of an organization and to guarantee that these requirements can be implemented in an integrated, cost-justified system. IE provides concepts that can be applied both at the corporate level to support long-range information systems planning and at the systems architecture level to develop effective computer-based systems. These IE concepts and principles make IE an effective Information Systems development approach. The in-depth IE review may help project managers better explain the IE approach to top-level management -- the risk involved, the initial high cost of investment, and the potential benefits for implementing IE. The study stresses the importance of strong and on-going high level management support and the need for adequate culture change from end users in order to support an effective and successful IE implementation. The findings may assist IS practitioners and IE experts in developing new strategies for implementing IE more effectively. Ultimately, the study may lead to a wider acceptance of IE in the IS environment. Dissert. Abstr.

ON CONCEPTUAL DESIGN OF ACTIVE DATABASES Ph.D. Thesis
Asterio Kiyoshi Tanaka 1992 182 p
Avail: Univ. Microfilms Order No. DA9315916

An active database management system (DBMS) is a system with full database functionality plus the additional capabilities of monitoring the state of the database and executing some predefined actions when appropriate events are detected. Although this is a well-established research area, and a few commercial relational DBMS's already support some active capabilities, no support for conceptual modeling and design of active database behavior is currently provided to take advantage of the new capabilities. The current database design methodology forces the user to defer major modeling decisions concerning the active behavior of the database to late stages of the design process, where the semantics of the real-world situations are obscured by the intricacies of the implementation model. This research addresses the conceptual design problem by incorporating active database behavior into the Entity-Relationship (ER) model, in the form of events and rules. The resulting Entity-Relationship Event-Rule (ER)(exp 2) model provides an extended architecture of tools for assisting the database designer in the task of specifying, analyzing, and translating active behavior into executable data definition statements in specific relational DBMS's. Meta-behaviors are identified that automatically enforce invariant properties of the model, along with user-defined integrity constraints. A high-level Petri net, e/r-net, whose places are events, transitions are rules, and net inscriptions are (ER)(exp 2) schema definitions is proposed as an analysis tool for validating the active behavior design. A prototype implementation of the extended architecture is described that takes advantage of the meta-data about the design process generated during the schema translation. The following benefits result from the extended data modeling and database design methodology: reduced database design and application development effort with the automatic generation of meta-behavior and translation of active behavior into executable DBMS language constructs; better control of the development of database applications by introducing precision in the specification of active behavior; and better quality of the overall design, with an interactive environment capturing the knowledge of application experts and automatically dealing with the DBMS constraints.

Dissert. Abstr.

THE EFFECTS OF INHERITANCE ON THE PROPERTIES OF PHYSICAL STORAGE MODELS IN OBJECT-ORIENTED DATABASES Ph.D. Thesis
Mary Jane Willshire 1992 132 p
Avail: Univ. Microfilms Order No. DA9315922

An important aspect of OODB is the concept of inheritance of properties down the class hierarchy. This thesis is the first to originate and name four data storage models for inherited instance variables: the repeat class, RC, implementing the logical view; the home class, HC, storing the data only once; the split instance, SI, splitting instances based on the class of origin; and the value triple, VT, using value triples and string pairs. We create a simulation and also generate a formal mathematical analysis to measure the performance of the models. For any set of parameter values, the numerical results are identical whether obtained from the simulation or by calculation. RC duplicates data which facilitates retrievals but is shown to result in high storage overhead and expensive writes. Thus RC is suitable for stable applications where space is not an issue. HC is a horizontal partitioning of the database and has no duplication. This facilitates write operations and reduces storage but complicates retrievals. This thesis shows that HC should be a good choice for a dynamic, general purpose application. SI is a vertical partitioning of the database with minor duplication. It is shown to have higher storage overhead than HC and the retrieval and write algorithms are more complicated because multiple classes are involved. Nevertheless, SI is also a good general purpose model. VT does not partition the database. VT requires the generation and storage of multiple identifiers and thus higher storage overhead. If clustering is enforced, then VT has good performance. But without clustering, this model is the worst of the four and should only be used in limited applications. In a parallel execution environment both HC and SI are shown to exhibit good speedup. However, HC is more limited and will not scale. SI maintains speedup over the range tested and will scale better than HC. We generated data allocation methods and parallel transaction algorithms, then tested the models under a mixed transaction load. This research provides the foundation for an OODB benchmark and demonstrates parallel execution benefits for an OODBMS.

DESIGN AND ANALYSIS OF CONCURRENCY CONTROL SCHEMES FOR HETEROGENEOUS DATABASE SYSTEMS Ph.D. Thesis
Heon Young Yeom 1992 125 p
Avail: Univ. Microfilms Order No. DA9315168

In Heterogeneous Database Systems (HDBS), concurrency control presents a new problem since serializability at the local level does not guarantee serializability at the global level. Several approaches have been proposed to solve the concurrency control problem in HDBS. However, most of the approaches either require some modification of the existing DBMS or put some restrictions on execution of the global transactions. The performance of these schemes are not studied very well. We propose a new scheme based on two phase processing of global transactions. In the first phase, the global transaction obtains all the locks for the data items to be accessed. The actual processing is performed in the second phase. Global locking is wed to resolve direct conflicts between the global transactions and indirect conflicts are handled by controlling the subtransactions using static locking for all the locking sites. Subtransactions are submitted to the timestamping sites only when other subtransactions for the locking site get all necessary locks. When lock predeclaration is possible, our scheme shows superior performance compared to other schemes. Even for the cases when locks cannot be predeclared, our scheme shows better performance if the DBMS provides enough database cache space. In addition to a detailed simulation model for the concurrency control performance, we present an analytic model for our scheme.

OBJECT-ORIENTED DATABASE SUPPORT FOR SCIENTIFIC DATA MANAGEMENT: A SYSTEM FOR EXPERIMENTATION Ph.D. Thesis
Hitomi Ohkawa 1993 210 p
Avail: Univ. Microfilms Order No. DA9320330

Scientific data management has recently become a critical research issue due to computerization and automation of scientific research procedures and the resulting explosion of electronic data. For proper

management of scientific data, adequate data types must be provided for representing the semantics of scientific data directly. Issues such as large data volume and data evolution are common among scientific applications, so traditional database support, such as storage management, are also beneficial to them. Current approaches such as standardized data formats and adoption of traditional databases do not accommodate the data support requirements of existing scientific applications well. Object-oriented databases, on the other hand, seem to hold promise, by combining flexible data models with traditional database support. In this dissertation, we constructed an experimental platform for exploring the design space for a scientific data management system. With this experimental approach, we could dynamically examine possible architectures for data support against actual instances of scientific data and typical operations executed on them. As many of the dynamic features of existing scientific applications, such as data access patterns, are yet to be discovered, the platform also provides an opportunity to explore such features. Based on the observed potential of object-oriented databases for scientific data management, the GemStone object-oriented database management system was chosen for the baseline data management architecture of the platform. Among scientific applications where better data support is desired, a scientific persistent language and data analysis environment called 'NewS' and applications using it were selected as a target for the study. Connecting NewS with GemStone provided a cost effective experimental platform where we could investigate a variety of scientific applications with single implementation. We incorporated GemStone into the NewS environment in such a manner that we could use existing NewS applications without modifications for experiments. We describe the design and implementation of our platform, GemStone-based NewS, and experiments performed on the platform. At the end, we describe primary contributions of the work, and assess whether or not our approach was a productive initial step toward improved scientific data management. Dissert. Abstr.

EVALUATION OF THE RESOURCE LIBRARY SYSTEM IN FINLAND

E. Toernudd 1993 60 p

(PB94-137734; OTA-KIRJASTO-A17) Avail: CASI HC A04/MF A01

The Finnish Council for Scientific Information and Research Libraries decided at its meeting on April 24, 1991 to have an inquiry made of the resource library system. The study was to examine the goals formulated for the system and their accomplishment with special reference to the use of the findings in the system of operating cost budgeting and in the development of LINNEA, the national network of research libraries using the American Virginia Tech Library System (VTLS) automation system. The integrated automated data processing system adopted by all major research libraries in the country greatly improves the opportunities to utilize the resource libraries. NTIS

SCIENTIFIC AND TECHNICAL INFORMATION TRANSFER: PROMOTING INFORMATION ACQUISITION IN THE SAUDI ARABIAN INDUSTRIAL SECTOR Ph.D. Thesis

Sulaiman Ibn Saleh Alogla 1993 240 p

Avail: Univ. Microfilms Order No. DA9323225

The availability of scientific and technical information (STI) resulting from adequate information acquisition on as broad a scale as possible is indispensable to maintaining the vitality and international competitiveness of industry. This study therefore investigates the current status of STI transfer to the industrial sector in Saudi Arabia. The study has both a broad and an immediate purpose: The study's broad purpose is to contribute to efforts made by Saudi scholars in planning for development of a comprehensive national Saudi network system for STI; and its immediate purpose is to propose a methodology based on the concept of information transfer that can aid in transmitting information quickly and efficiently from information producers to ultimate users in Saudi industry. In order to accomplish the above purposes, the study examined the general characteristics of STI flow to Saudi industrial companies, acquisition patterns among various industries, and factors affecting information flow to the industrial sector. The study's variables were examined using a self-administered mail questionnaire supplemented by field visits to Saudi industries. A purposive sample of Saudi industries was taken by selecting those industries possessing libraries or information centers. Descriptive statistics were used for the study's data analysis. Based on the study's findings, it was found that Saudi industries acquired a large amount of information in one year, 1991. In acquiring information, Saudi industries used original producer nodes for domestic information and distributor nodes for foreign resources. Information most often was transferred directly from originating sources to industrial information centers, and the second most common means of transfer was through the use of one intermediary. Also based on the study's findings, there appeared to be many barriers affecting information transfer in the Saudi industrial sector, for instance, shortage of skilled Saudi information specialists, absence of acquisition tools, absence of professional industrial information centers, lack of cooperation between the public and industrial sectors, and lack of scientific impact on the highest levels of industrial management. These barriers can be minimized by the study's proposed information transfer system. The system presents ways in which Saudi industrial companies acquire information quickly and efficiently from foreign and domestic sources, and thus links information producers to ultimate users in Saudi industries. The system can be used by Saudi industries to improve and facilitate information service to their community users. Dissert. Abstr.

HUMAN AND INSTITUTIONAL FACTORS IN GIS IMPLEMENTATION BY LOCAL GOVERNMENTS Ph.D. Thesis

Zorica D. Budic 1993 391 p

Avail: Univ. Microfilms Order No. DA9324002

Large numbers of local governments in the U.S. engage in acquisition and implementation of geographic information systems (GIS). Among other factors, the human and the institutional factors appear as major obstacles to successful implementation of GIS technology and thus are very important determinants of adoption of the technology. Influence of personal and institutional factors on the adoption of GIS technology in local governments is the main focus of this research. It examines the process of GIS diffusion in local government and GIS management as it affects the implementation of GIS technology. The research employs case study and survey methodology. A multiple case study was conducted on four agencies in a county government setting. A mail survey was administered in 140 local government agencies located in North Carolina, on a sample of 627 employees, with 55.7 percent return rate. The research has dual units of analysis, local government agencies and individual employees within those agencies. It studies the relationship between people, organizations, and technology as the prime determinant of GIS implementation success. Founded on the theory of diffusion of innovations and research on organizational computing, this research achieves three objectives. First, it tests propositions that advance the perceptions, experience, attitudes, and communication behavior of current and prospective GIS users as they affect the employees' decisions to adopt or reject the GIS technology. Perceived relative advantage from using the technology and computer experience are found to strongly impact the adoption. Secondly, it isolates the major elements of GIS management, organizational environment, and organizational internal context which foster or impede the adoption of GIS technology in local government settings. Among those factors, provision of incentives for prospective users, GIS training, political support for GIS, organizational conflicts, stability of organizational internal environment, availability of resources, and motivation for incorporation of the technology are found to exert significant influence on the success of GIS implementation. And thirdly, it gains considerable insight into the process of diffusion of GIS technology within local governments. Complexity, dynamism, and idiosyncrasy are three major attributes that describe the process.

ENHANCING PERFORMANCE OF FULL-TEXT RETRIEVAL SYSTEMS USING RELEVANCE FEEDBACK Ph.D. Thesis

Sung Been Moon 1993 208 p

Avail: Univ. Microfilms Order No. DA9324078

The primary purpose of the study is to improve the low precision often found in full-text retrieval systems. In order to enhance the low precision of full-text retrieval while retaining its high recall, relevance feedback mechanisms based on probabilistic retrieval models (binary independence model and two-Poisson independence model) were employed. This study investigates the performance of full-text retrieval systems before and after the incorporation of relevance feedback. Main effects and interaction effects

of three independent variables ((A) types of document representation, (B) term distribution models, and (C) incorporating relevance feedback) were examined using three repeated measures of ANOVA. It was observed that the tests of the main effect on A and C were significant, but the test of the main effect on B was not significant. There was no significant three-way interaction, but there were two-way interactions between the variables. The pattern of the interaction (between A and B) revealed that the retrieval effectiveness of using abstracts and titles deteriorated when moving from the BI model to the TPI model, while the retrieval effectiveness of full-texts improved. The pattern of the interaction (between B and C) indicated that the incorporation of relevance feedback gained more with the TPI model than the BI model. The analysis of the overall performance (average precision at 0.25, .50, and 0.75 recall levels), averaged over all 83 queries, showed that retrieval using abstracts and titles with the BI model outperformed the others, both with and without relevance feedback. On the other hand, it was found that retrieval performance of full-texts significantly improved after the incorporation of relevance feedback. In particular, the analysis of the retrieval performance of the seven queries having large numbers of relevant documents, after the incorporation of relevance feedback, revealed that the precision at relatively high recall levels of full-text retrieval exceeded that of retrieval using abstracts and titles. The findings of this study suggest that the use of abstracts/titles is better for retrieval than full-texts, and that relevance feedback be incorporated in full-text retrieval systems to enhance the low precision. A UNIFIED FRAMEWORK FOR RETRIEVAL IN IMAGE DATABASES Ph.D. Thesis
Venkat Naidu Gudivada 1993 170 p
Avail: Univ. Microfilms Order No. DA9324600

Image Retrieval (IR) problem is concerned with retrieving images that are relevant to users' requests from a large collection of images, referred to as the image database. Since the image database application areas are very diverse, the features of the existing image database systems have essentially evolved from domain specific considerations. In order to provide a generic approach to the IR problem, we have introduced a unified framework for retrieval in image databases. The framework supports four generic retrieval types: Retrieval by Browsing (RBR), Retrieval by Non-semantic Attributes (RNA), Retrieval by Spatial Constraints (RSC), and Retrieval by Semantic Attributes (RSA). To support these generic retrieval types, we have proposed an image data model referred to as AIR. AIR data model employs multiple logical representations. The logical representations can be viewed as abstractions of physical images at various levels and help toward achieving domain independence. We identify and provide solutions to the following three major research issues that arise in the context of AIR data model: algorithms for processing RSC queries, methods for the identification of semantic attributes, and algorithms for processing RSA queries. An algorithm, referred to as SIM(sub R), is developed for processing RSC queries. SIM(sub R) is robust in the sense that it can deal with translation, scale, and rotation variances in images. Personal Construct Theory (PCT) from clinical psychology is introduced as a knowledge elicitation tool for systematically deriving semantic attributes to support RSA. Also, an algorithm for RSA (based on the knowledge elicited from a domain expert using PCT) is developed. This algorithm incorporates user relevance judgments in the form of preference relations and incrementally improves retrieval quality. Dissert. Abstr.

INFORMATION CENTER ASSESSMENT Ph.D. Thesis
Joan E. Hoopes 1993 256 p
Avail: Univ. Microfilms Order No. DA9326072

Information centers (IC's) need to justify their existence to general management. Although the IC is an accepted part of the organization, management needs an accounting of what the IC provides to the organization. Several assessment methods can be used. Critical success factors and end user satisfaction are two methods studied in this thesis. The objectives of this research are to provide IC managers with information regarding IC assessment practices and a set of practical assessment measures and tools that they can use, and to provide information for IC researchers about IC assessment that has been sorely lacking. These objectives were fulfilled by developing an assessment framework from the IC and assessment literature, two survey instruments to determine IC performance ratings and importance rankings of critical success factors (CSFs) by IC personnel and end users, and a usable end-user satisfaction questionnaire. The research findings indicate that assessment does take place in industry and that the most widely used and recommended assessment measure is end-user satisfaction. Critical success factors (CSF's) are a good indicator of IC health and can be used to determine its success. IC managers can monitor the CSF's to ensure the health of the IC. The proposed end-user satisfaction questionnaire is a useful measurement tool and can be used to help IC's achieve success. Dissert. Abstr.

HYPRA/TR: A TUPLE ORIENTED RECOVERY METHOD FOR A CONTINUOUSLY AVAILABLE DISTRIBUTED DBMS ON A SHARED NOTHING MULTI-COMPUTER
S. Hvasshovd 6 Jul. 1993 279 p Prepared in cooperation with DELAB, Trondheim, Norway
(PB94-141264; STF40-A93085) Avail: Issuing Activity (National Technical Information Service (NTIS))

The relational data base management system (DBMS) technology is a success in the commercial market place with respect to business data processing and related applications. This success is a result of cost effective application development combined with high data consistency. The success has led to the use of relational DBMS technology in other application environments requesting its traditional virtues, and at the same time adding new requirements. For example, the integration of relational DBMS technology with telecommunications has led to such requirements as transaction rates of 50,000 TPC-B equivalent transactions per second, transaction service availability of certain transaction classes of 99.9996%, and transaction response time under 10 milliseconds. The current trends in hardware price/performance and parallel technology make relational DBMS's which support very high transaction rates, very high availability, and soft real-time transaction response a cost effective possibility. This thesis describes a recovery method supporting the traditional high DBMS data consistency while offering very high transaction rates, continuous availability, and soft real-time transaction response. SECURE NETWORK DATABASES: SURVEY AND ANALYSIS
S. O. Hvasshovd and S. Haug 22 Jun. 1993 77 p See also AD-A225528
(PB94-138492; STF40-A93074) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report presents a survey and an analysis of multilevel secure database management systems (DBMS). The DBMS is assumed applied in network databases. Secure databases become of vital concern when customers are allowed to access mission critical telecommunication network databases. The report gives an overview of the major concerns of database security: Secrecy, consistency, and availability. The focus has been on the two first items. A survey and analysis of different architectural and policy approaches to mandatory and discretionary access control policies are given. Multilevel security affects a number of the internal mechanisms of a DBMS such as concurrency control and recovery. It is vital to choose policies that avoid covert channels. We have in the report developed a new concurrency control policy called advanced orange locking. A recovery method that goes with the advanced orange locking policy is developed. The recovery method is based on the ARIES recovery method. The report gives a survey of multilevel secure distributed DBMS's. We have in particular focused on management of cryptography keys as this is of particular concern in a secure DBMS. A scheme supporting mode autonomy with respect to cryptography key is proposed. PAUSING BEHAVIOR OF END-USERS IN ONLINE SEARCHING Ph.D. Thesis
Mu-Hsuan Huang 1992 270 p
Avail: Univ. Microfilms Order No. DA9315656

This research used an information processing approach to analyze the behavior of end-users in searching online bibliographic databases, emphasizing their pausing behavior. It is based on viewing the search as a

series of actions and pauses (rests). The end-users are 41 students and 3 faculty. After instruction, subjects searched throughout the semester, doing 79 searches. Nineteen did multiple searches. Pausing behavior was related to time as a measure of growing experience. Six hypotheses were supported by the results of ANOVA and t-tests: The searchers paused less frequently and for shorter periods as they progressed through searches. With more experience and practice, searchers moved more smoothly online, and the ratio of pausing to online time decreased over time. Over a series of searches or cycles within long searches, searchers gradually began to chunk more information between pauses, both in amount of time and in number of elements. Pauses related to syntax decreased over time. This study identified 250 reasons for pausing (e.g. to verify a set number, to choose appropriate term operator, to consider alternative terms) and 6 types of searches on the basis of pausing behavior. The six types of searches were highly associated with search fluency and the construction of a mental model. Types 1 and 2 describe gradations of fluent searches and Types 3 to 6 describe various slow searches. Type 1 and 2 searches were conducted by subjects who had more knowledge about the search topic and more experience in the search language and in CD-Rom searching. They generated fewer pauses and chunked more information online. They paused for shorter times and had a lower hesitation rate. The other types were conducted by subjects with less experience in the search language, in CD-Rom searching, and in the search topic. They made more syntax-related pauses (especially in the beginning of the searches), generated more and longer pauses, chunked less information online, and had a higher hesitation rate. Finally, as searchers gained more experience, they increased their search proficiency and became more fluent online. The changes of search level in multiple searches showed most searchers moved toward greater fluency. Dissert. Abstr.

COMPUTER-BASED LINKING OF THESAURI Ph.D. Thesis
Amba Sanjeevi 1992 160 p
Avail: Univ. Microfilms Order No. DA9313069

Studies on database searching indicate that searching of multiple databases is on the increase. This searching requires the use of multiple thesauri, when a controlled vocabulary search is carried out. The use of multiple thesauri involves identification of terms in the different thesauri. The terms should be analogous to each other and substitutable for one another. The problem could be stated as: For each term in Thesaurus 1, associate a set of terms in Thesaurus 2, such that the retrieval based on the set of terms from Thesaurus 2 is as effective as the retrieval using the original term from Thesaurus 1. The study examined the feasibility of the vector-space model. The cluster-based approach was used to link terms from two thesauri, 'The Thesaurus of ERIC Descriptors' and the 'Thesaurus of Psychological Index Terms.' A set of documents, indexed by terms from the two thesauri, was identified and these common documents formed the basis of the study. Co-occurrences of ERIC and Psyc descriptors in the set of common documents were used to form clusters using the Single Link Method. The clusters contained both ERIC and Psyc terms to ensure linking at the time of clustering itself. Effectiveness of linking was checked by validating each cluster on the basis of pre-established criteria using Precision and Recall, two standard measures in information retrieval. The clusters generated were tested further on another set of documents common to both databases. It was demonstrated that the procedures developed can be used to link thesauri. The advantages of this approach are: linking is done on the basis of the thesaurus terms assigned as descriptors; flexibility in cluster formation is possible; changes in terminology or indexing policies will not affect the basic procedures developed; and problems of reconciling incompatibility among thesauri are circumvented. It was also found that (1) terms which are in a cluster or co-occur do not always exhibit thesaural relationships; (2) a term from one thesaurus is not always linked to only one term from the second thesaurus; and (3) lexically equivalent terms do not always co-occur. (Contract DE-AC04-94AL-85000)
(DE94-005076; SAND-92-2926) Avail: CASI HC A04/MF A01

The Microsoft (MS) Windows product is widely available for PC's. There exists many thousands of them at Sandia. All of the MS applications in Windows have a Help file. This help file informs the user 'how to' use and run that application. It is an 'on-line' manual. The 'Help Compiler' was obtained from Microsoft. Use of this compiler enables one to insert text in a form the MS 'Help Engine' recognizes. This means all of the features of the Help file, hypertext (hot links), browsing, searching, indexing, bookmarks, annotation, are available for your text. This turns a document into a 'Smart Document.' The use of this Smart Document System (SDS) for Engineering Procedures (EP's) is described. DOE

MODELLING THE EVOLUTION OF INFORMATION SYSTEMS
J. L. H. Oei, H. A. Proper, and E. D. Falkenberg 20 Dec. 1992 24 p Sponsored by Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-36; ETN-94-95620) Avail: CASI HC A03

The need for information systems capable of evolving to the same extent as organization systems is addressed. A set of requirements for evolving information systems is presented, implying the importance of the time concept in these systems. On the basis of these requirements an architecture and a conceptual framework for evolving information systems is proposed. In the conceptual framework for update, distinction is made between recording, correction and forgetting. State transitions are considered on three different levels of abstraction: the event level, the recording level and the correction level. A formal specification of the transformation process between user update requests, primitive update requests, and the three level model for update is provided. ESA

(TR-92-22; ETN-94-95611) Avail: CASI HC A03

A study on evolving information systems is presented. A delimitation of the concept of evolution is discussed. The main result is a first attempt to a general theory for such evolution. In this theory, the underlying data model is a parameter, making the theory applicable for a wide range of modeling techniques. ESA

N94-30359 Nijmegen Univ. (Netherlands). Dept. of Information Systems.
EVOLVING INFORMATION SYSTEMS: MEETING THE EVER-CHANGING ENVIRONMENT
J. L. H. Oei, H. A. Proper, and E. D. Falkenberg 9 Oct. 1992 18 p Sponsored by Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-24; ETN-94-95613) Avail: Issuing Activity (European Space Agency (ESA))

To meet the demands of organizations and their ever changing environment, information systems are required which are capable of evolving to the same extent as organizations do. Such a system has to support changes of all time and application dependent aspects. Requirements and a conceptual framework for evolving information systems are presented. This framework includes an architecture for such systems, and a revision of the traditional notion of update. Based on this evolutionary notion of update (recording, correction, and forgetting) a state transition oriented model on three levels of abstraction (event level, recording level, correction level) is introduced. A running example is provided to illustrate the conceptual framework for evolving information systems. ESA

A GENERAL THEORY FOR THE EVOLUTION OF APPLICATION DOMAINS
H. A. Proper and T. P. vanderWeide 3 Nov. 1992 25 p Sponsored by Netherlands Organization for Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-26; ETN-94-95614) Avail: CASI HC A03

A study on evolving information systems is presented. A delimitation of the concept of evolution is discussed. The main results are a first attempt to a general theory for such evolutions, and a general study on the issue of type relatedness of object types. In this theory, the underlying data model is a parameter, making the theory applicable for a wide range of modeling techniques. ESA

A FRAMEWORK FOR COMPARING CONCEPTUAL MODELLING LANGUAGES
T. A. Halpin (Queensland Univ., Brisbane, Australia.) and J. L. H. Oei Nov. 1992 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-29; ETN-94-95616) Avail: Issuing Activity (European Space Agency (ESA))

In practice various methods are used for the conceptual modeling phase of information systems design. For a given application, a single method or even a mix of method components may be more appropriate. To judiciously select methods it is necessary to have some appreciation of their strengths and weaknesses. In some cases (for example re-engineering, or large scale schema integration) it may be necessary to translate between different modeling approaches. A framework for comparing conceptual modeling methods, from the viewpoints of expressive power and practicality (with respect to convenience, efficiency and learnability), is discussed. The general ideas are illustrated by comparing two popular methods (entity-relationship modeling and object-role modeling), with the formal comparison being presented at the metalevel. Extensions are suggested to widen the scope of the framework. ESA

A NOTE ON SCHEMA EQUIVALENCE
A. H. M. terHofstede, H. A. Proper, and T. P. vanderWeide Nov. 1992 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TR-92-30; ETN-94-95617) Avail: CASI HC A02

Terminology for comparing the expressiveness of conceptual data modeling techniques, such as ER, NIAM, and PM, that are finitely bounded by their underlying domains, is introduced. Schema equivalence is considered, and effects of the sizes of the underlying domains are discussed. This leads to the introduction of the concept of finite equivalence. Examples of finite equivalence and inequivalence in the context of PM are given. ESA

USING STEREOSCOPIC IMAGING FOR VISUALIZATION APPLICATIONS
S. J. Adelson 1994 13 p Presented at the IS and T/Society of Photo-Optical Instrumentation Engineers (SPIE) Meeting on Electronic Imaging Science and Technology, San Jose, CA, 6-10 Feb. 1994 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-006247; LA-UR-94-0116; CONF-940247-1) Avail: CASI HC A03

The purpose of scientific visualization is to simplify the analysis of numerical data by rendering the information as an image. Even when the image is familiar, as in the case of terrain data, preconceptions about what the image should look like and deceptive image artifacts can create misconceptions about what information is actually contained in the scene. One way of aiding the development of unambiguous visualizations is to add stereoscopic depth to the image. Despite the recent proliferation of affordable stereoscopic viewing equipment, few researchers are at this time taking advantage of stereo in their visualizations. It is generally perceived that the rendering time will have to be doubled in order to generate the pair, and so stereoscopic viewing is sacrificed in the name of expedient rendering. We show that this perception is often invalid. The second half of a stereoscopic image can be generated from the first half for a fraction of the computational cost of complete rendering, usually no more than 50 percent of the cost and in many cases as little as 5 percent. Using the techniques presented here, the benefits of stereoscopy can be added to existing visualization systems for only a small cost over current single-frame rendering methods. DOE

INFORMATION-SEEKING IN HYPERTEXT: MULTIPLE ACCESS METHODS IN A FULL-TEXT HYPERTEXT DATABASE Ph.D. Thesis
Peter Liebscher 1993 267 p
Avail: Univ. Microfilms Order No. DA9327456

This study focussed on the interaction between users, the system, and tasks during information retrieval in a full-text hypertext system. It drew on mental model theory to examine the users' views of information retrieval systems and how these views affected their information seeking behavior in a hypertext system offering multiple access methods. The access methods provided for this study were an alphabetical index, an hierarchical subject index, Boolean string search, and a network browser. Eleven undergraduate participants and one expert in hypertext systems were given a number of tasks and were observed intensively and individually over five sessions, each lasting approximately 2 to 2.5 hours. Access methods were used individually for the first four sessions. For the final session, all four access methods were available. Participants were given a total of 22 information retrieval tasks. Because the study was exploratory, no hypothesis testing was done. Eleven research questions served to guide the design of the protocols and the observations themselves. Results indicate that undergraduate users of new hypertext information systems use elements of existing mental models for information systems as they interact with the new system. Benefits are quick learnability of system syntax and the ability to apply known information-seeking strategies in the new environment. Drawbacks are inefficient or failed searches due to misapplication of mental models for familiar systems. String search proved to be the overwhelming choice of access method for hands-on retrieval tasks. Selection of string search was independent of task. Principal reasons for selection of string search were a desire to do word rather than conceptual searches and to minimize the amount of text scanned/read. Hypertext features, such as text embedded highlighted links, were also used to minimize reading. User characteristics, such as subject knowledge, computer experience, and gender, rather than task characteristics, were factors in selection of access method. Overall, participants were successful in their retrieval tasks, but more successful using string search and the network browser than using the indexes. However, success was often attained through serendipitous browsing which indicates that the relatively small size of the database was also a factor. Dissert. Abstr.

VIEW INTEGRATION: A SURVEY OF CURRENT DEVELOPMENTS
C. Francalanci and B. Pernici Jul. 1993 85 p Sponsored in part by CNR, and EEC
(Rept-93-053; ETN-94-95817) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Past study of view integration has resulted in the standardization of the terminology and of the steps of the integration process. Nevertheless, the issues left open by past research and the evolution of database technology has originated a reconsideration of the problems related with view integration. This has happened not only in the database design context, but in other areas as well, such as artificial intelligence applications, repository design and maintenance, software requirement elicitation, yielding new approaches, new techniques and new tools for performing view integration. However, researchers in different fields have selected and studied the subset of integration problems that is related to the purposes of the specific context, so causing a proliferation of proposals isolating and investigating single problems. The set of integration problems separately studied in different contexts can be the basis of a framework for the comparative analysis of the different contributions. A classification of the integration problems studied in recent research work is proposed, and available results for each of them are illustrated, highlighting agreements and disagreements among solutions proposed in different contexts and under different hypotheses. MEASURING THE IMPACT OF INVESTMENTS IN INFORMATION TECHNOLOGIES ON BUSINESS PERFORMANCE
C. Francalanci and P. Maggiolini Sep. 1993 24 p
(Rept-93-056; ETN-94-95819) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

The relationship between performance and investments in information technologies are analyzed. The research is conducted by investigating the correlation between the aggregate annual expense in information technology and two indexes of firm performance, which are defined and justified. In the literature, this research stream is not particularly active, especially due to the failure of traditional business performance indicators; nevertheless, the positive results of some research works and the generally high interest of firms, especially within the current crisis context, inspired the study. A theory explaining the role of information technology in the organizations as a basis for the definition of the indexes of firm performance and for experience on the business data collected is presented. Results of experimentation are presented, illustrating trends confirming theoretical hypotheses and discussing possible causes motivating opposite trends. ESA

The purpose of this research was to explore in detail the ways that companies were experimenting with using assessment centers for development purposes. Ten case study organizations were visited in the course of the research for this study. They were chosen for their varying

experience in the use of development centers. This report is intended as a summary of the main issues which arose during the case study visits. It is written for practitioners within organizations and focuses, in particular, on the issues concerned with the use of development centers. It is concerned with how information from a development center is used to foster individual career development within organizations, rather than on technical issues concerned with assessment methods. Spin-off companies constitute one important technology transfer channel between technical research institutes and their environment. Such companies thus constitute an important element of national systems of innovation. The technology transfer effects of companies spun off from technological research have only rarely been systematically analyzed. The present study expands the scope of analysis over the early life cycle of a new, technology-based company. For this purpose, a three stage model depicting the technology transfer effects of new, technology-based companies is developed. The empirical sample of the present study consists of 35 companies spun off from the Technical Research Center of Finland. The empirical data is gathered in personal interviews of the founders of the companies. In the interviews, structured questionnaires are used. NTIS

THICK THERMAL BARRIER COATINGS FOR DIESEL COMPONENTS Final Report
T. M. Yonushonis Aug. 1991 131 p Sponsored by DOE, Washington, DC Original contains color illustrations
(Contracts DEN3-331; DE-AI01-86CE-50162)
(NASA-CR-187111; NAS 1.26:187111; DOE/NASA/0331-1) Avail: CASI HC A07/MF A02; 1 functional color page

An engineered thick thermal barrier coating consisting of multiple layers of zirconia and CoCrAlY with a zirconia top layer and having a system thermal conductance less than 410 w/m(exp 2)K exceeded the 100 hour engine durability goals set forth in this program. The thermal barrier coatings were intact at the test conclusion. Back to back single cylinder research engine tests were conducted with watercooled, metal hardware and oil-cooled, thermal barrier coating insulated hardware to determine apparent heat release and fuel economy. Apparent heat release data revealed that the insulated engine had a shorter ignition delay and a longer combustion duration than the metal engine. The insulated engine fuel economy was approximately two percent worse on average for this series of tests. There was no attempt to optimize engine efficiency of the insulated engine by modifying the engine timing, coating, or other techniques. Author

TECHNOLOGY TRANSFER INITIATIVES Final Report, Apr. - Dec. 1993
Wayne McCain, Bernard J. Schroer, and M. Carl Ziemke Jan. 1994 92 p
(Contract NCC8-18)
(NASA-CR-195151; NAS 1.26:195151; CAR-94-02) Avail: CASI HC A05/MF A01

This report summarizes the University of Alabama in Huntsville (UAH) technology transfer activities with the Marshall Space Flight Center (MSFC) for the period of April 1993 through December 1993. Early in 1993, the MSFC/TUO and UAH conceived of the concept of developing stand-alone, integrated data packages on MSFC technology that would serve industrial needs previously determined to be critical. Furthermore, after reviewing over 500 problem statements received by MSFC, it became obvious that many of these requests could be satisfied by a standard type of response. As a result, UAH has developed two critical area response (CAR) packages: CFC (chlorofluorocarbon) replacements and modular manufacturing and simulation. Publicity included news releases, seminars, articles and conference papers. The Huntsville Chamber of Commerce established the Technology Transfer Subcommittee with the charge to identify approaches for the Chamber to assist its members, as well as non-members, access to the technologies at the federal laboratories in North Alabama. The Birmingham Chamber of Commerce has expressed interest in establishing a similar technology transfer program. This report concludes with a section containing a tabulation of the problem statements, including CAR packages, submitted to MSFC from January 1992 through December 1993.

OPTIMIZATION TECHNIQUES FOR A DIAL-A-RIDE TRANSPORTATION SYSTEM IN URBAN ENVIRONMENT
A. Colorni and G. Righini Jul. 1993 18 p Presented at the 6th Workshop on Scheduling of Public Transport, Lisbon, Portugal, 1993 Sponsored in part by CNR
(Rept-93-051; ETN-94-95816) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

The optimization of a dial-a-ride transportation system in urban environment presents a double combinatorial aspect: allocating customers to vehicles and routing every vehicle. The problem has two different versions: the static one, in which all requests for service are known in advance, and the dynamic one, in which the requests come at run time. Due to the

complexity of the problem it is necessary to design approximate algorithms, especially for the dynamic problem where tight bounds on the computing time must be satisfied. The problem is faced from two viewpoints: the model is defined, and in particular an objective function different from those usually mentioned in the literature and more coherent with the viewpoint of customers is proposed; an allocation routing algorithm, in which the allocation phase is performed with annealing techniques, while the routing phase takes some ideas from genetic algorithms, is proposed. Open research questions which will lead to future developments are indicated. ESA

CBSD: THE CELESTIAL BACKGROUND SCENE DESCRIPTOR Final Report, Apr. 1988 - Jan. 1993
J. P. Kennealy, P. V. Noah, E. F. Tedesco, R. M. Cutri, and S. F. Dermott Jan. 1993 257 p
(Contract F19628-88-C-0014)
(AD-A275521; PL-TR-93-2215) Avail: CASI HC A12/MF A03

This report documents the Celestial Background Scene Descriptor (CBSD) program which is a suite of models to simulate the radiance of astronomical sources. The model simulate the contribution of the celestial background in the wavelength regime 2 to 30 micrometers with a positional accuracy of 2 arcseconds. The output of the models are tables and images suitable for use in sensor simulation. The CBAMP model calculates the thermal radiance and scattered light for the solar system objects including the Sun, Moon, the planets, the Galilean Satellites, 4559 numbered asteroids, and 9643 unnumbered asteroids. The solar system dust cloud (Zodiacal light model CBZODY) uses a Lorentzian out of the plane dust density distribution to derive a number density from which the emitted and scattered radiances are computed. The stellar point sources model, CBPNTS, is a 'fast' running scene generator version of the Air Force/NASA/Ames statistical point source model, SKY. The sky is divided into 899 regions with size inversely proportional to stellar density. In addition, there are 87 different spectral classes, including 82 classes of stars, two classes each of planetary and reflection nebulae, and one of compact H2 regions. The nature of the galactic infrared cirrus is discussed. DTIC

X RAY STUDIES OF THE HYADES CLUSTER Final Report
Robert A. Stern 8 Oct. 1993 22 p
(Contract NAS5-32070)
(NASA-CR-189325; NAS 1.26:189325) Avail: CASI HC A03/MF A01

The Hyades cluster occupies a unique position in both the history of astronomy and at the frontiers of contemporary astronomical research. At a distance of only 45 pc, the Hyades is the nearest star cluster in the Galaxy which is localized in the sky: the UMa cluster, which is closer, but much sparser, essentially surrounds the Solar neighborhood. The Hyades is the prototype cluster for distance determination using the 'moving-cluster' method, and thus serves to define the zero-age main sequence from which the cosmic distance scale is essentially bootstrapped. The Hyades age (0.6-0.7 Gyr), nearly 8 times younger than the Sun, guarantees the Hyades critical importance to studies of stellar evolution. The results of a complete survey of the Hyades cluster using the ROSAT All Sky Survey (RASS) are reported. Author

GLOBULAR CLUSTER PHOTOMETRY NEAR THE TURNOFF: BLUE STRAGGLERS, RELATIVE AGES, AND THE HORIZONTAL BRANCH Ph.D. Thesis
Ata Sarajedini 1992 360 p
Avail: Univ. Microfilms Order No. DA9315242

Using CCD color-magnitude diagrams of Galactic globular clusters in the B and V filter bands, we focus on the main sequence turnoff region and its usefulness in studying blue straggler stars, relative cluster ages, and the luminosity of the horizontal branch. In addition, we have measured several basic photometric parameters for the clusters in our program; these include NGC 288, NGC 3201, NGC 4372, NGC 4590 (M68), IC 4499, NGC 5897, NGC 6101, NGC 6171 (M107), NGC 6496, NGC 6584, NGC 6723, NGC 6809 (M55), NGC 6934, and NGC 6981 (M72). Of the 14 globular clusters in our sample, 11 appear to have definite blue straggler sequences. In the majority of cases, the blue stragglers are found to be more centrally concentrated and therefore more massive than the subgiant branch stars. Furthermore, the characteristics of the clusters which contain blue stragglers span practically the entire observed range for Galactic globular clusters. It therefore seems that all such systems must contain blue stragglers. The HR diagram of the blue stragglers reveals that all of these stars occupy the same general region of this diagram, but the mean location of the individual cluster sequences do scale with metal abundance in the expected fashion. Finally, the luminosity function indicates the possible identification of blue stragglers which have evolved away from their initial positions. There exists a range in age among the Galactic globular clusters of 3 to 5 gigayears. Such a range suggests a relatively slow formation timescale for the Galactic halo. In addition, from the variation of age as a function of horizontal branch type, we conclude that age is the 'second parameter' which, along with metallicity, governs the behavior of the horizontal branch. Finally, we derive a simple algebraic expression that describes the slope of the horizontal branch luminosity-metallicity relation in terms of three relative cluster parameters. Using available values of these quantities in 8 globular clusters, we compute a slope of 0.15 +/- 0.05 for the variation of horizontal branch luminosity with metallicity.

ON OBSERVING NEUTRON STAR OSCILLATIONS Ph.D. Thesis
Tod E. Strohmayer 1992 258 p
Avail: Univ. Microfilms Order No. DA9304794

To investigate detecting and identifying neutron star oscillations in x ray sources, a technique for computing the light curves produced from polar cap hotspots on rotating, oscillating neutron stars is developed. The calculations include the effects of general relativity on the photon trajectories and allow for anisotropic beaming of radiation from the polar caps. A simple model, based on stellar oscillation, for the subpulse drift phenomenon observed in some radio pulsars is also described. Simulations of x ray observations of both x ray bursters and x ray pulsars using parameters appropriate to XTE and AXAF are investigated in order to assess the likelihood of detecting neutron star oscillations in these sources. To examine theoretically whether or not oscillations of neutron stars can modulate pulsar radio emission, a cylindrical model for the polar cap region of pulsars is investigated. An argument based on relativistic beaming allows estimation of the surface oscillation amplitude required to produce potentially observable variations in the beaming angle. For this model, short period modes require smaller surface displacements, and therefore less energy, to excite potentially observable variations. To investigate the hypothesis

that neutron star oscillations may be present in the radio emission from pulsars, radio pulsar data are analyzed for the presence of coherent periodicities. The analysis technique described here allows measurement of the coherence properties of pulsar signals. To test this method and interpret results from pulsar data several simulated pulsar models are constructed and analyzed. An analysis of 2000 consecutive pulses from PSR 2016 + 28 yields the following conclusions: The micropulse coherence time at 430 MHz is much less than the spin period of this object. This result could be consistent with a coherent model if the random phase jitter in such a model were greater than or equal to 35 percent of the micropulse quasiperiodicity. The subpulse separation, P(sub 2) approximately equals 10 ms, is coherent across four to five pulse periods, suggesting a higher Q-value for this process than for the micropulses. This coherence level is reasonably consistent with a model of subpulse drift that allows for random variation about some mean drift rate. Additional analysis of data from two other pulsars, PSR 1133 + 16 and PSR 0950 + 08, reveals no evidence for coherent oscillations in these objects as well.

THE CATACLYSMIC VARIABLES FROM THE PALOMAR-GREEN SURVEY Ph.D. Thesis

F. A. Ringwald 1993 299 p

Avail: Univ. Microfilms Order No. DA9322598

This thesis explores the cataclysmic variables (CV's) found by the Palomar-Green (PG) survey. This is the first compilation of a statistically complete sample of CV's found by ultraviolet color excess, and not outburst behavior. Blue and red follow-up spectrophotometry suggests that 22 of 68 objects classified originally as CV's are hot subdwarfs. Cool companions may be mimicking CVs' flat energy distributions, although the possibility remains that some are face-on CV's. Spectra taken with the International Ultraviolet Explorer prove useful for distinguishing difficult cases. With the CV sample defined, the orbital periods for eleven systems are investigated with radial velocity studies. At 16th magnitude, CV number counts increase by 2.3 mag(exp -1), although this may level off. The luminosity function is examined for the first time, and a trend toward higher space density at low luminosity is suspected. Outburst properties are compiled, and low-luminosity dwarf novae inflate the total space density to 6 x 10(exp -6) pc(exp -3). I describe all the PG CV's and candidate objects, and show spectra for most. This sample should be useful for population studies, such as measuring the space density with trigonometric parallaxes, or finding the fraction of eclipsing CV's. A new class of nova-likes, the SW Sextans stars, is characterized by absorption events of the emission lines at spectroscopic phase 0.5, accompanied by large phase lags between the lightcurves and the radial velocity curves and strong high-excitation emission. There are at least six such CV's in this sample of 33, so this mysterious behavior must be common and not peculiar, as previously thought. Five of these six objects eclipse. Serendipitous results for individual CV's include finding low-frequency quasi-periodic variations in the radial velocity curve of the dwarf nova BZ Ursa Majoris. While erratic from epoch to epoch, these are too coherent to be pure noise. Another dwarf nova, HX Pegasi, is caught with time-resolved spectrophotometry on the rise to outburst. This is the second-ever such observation, and the first with red spectra. HX Pegasi is also confirmed as having a novel subdwarf-K red star.

ABUNDANCE PATTERNS IN RED-GIANT CH STARS Ph.D. Thesis

Andrew Douglas Vanture 1992 172 p

Avail: Univ. Microfilms Order No. DA9312755

A detailed abundance analysis of seven red-giant CH stars has been conducted. Using high resolution echelle and coude spectrographic data and modern analysis techniques involving model stellar atmospheres and computer codes which model LTE radiative transfer, the abundances of carbon, nitrogen, and oxygen, the carbon isotope ratios, and the abundances of the s-process elements have been determined. The carbon isotope ratios are found to break the red-giant CH stars into two groups: those with C-12/C-13 greater than or equal to 20 and those with C-12/C-13 approximately equal to 4 (a value associated with equilibrium burning of the CN cycle). In addition, carbon and nitrogen abundances are found to be greatly enhanced, (C + N/Fe) approximately equal to +1.0. Lastly, it is found that the red-giant CH stars show large enhancements of the s-process elements with the enhancements of the heavy s-process peak elements (Ba through Sm) being larger than the light s-process peak elements (Sr, Y, and Zr) by a factor of approximately six. Taken with the orbital data available for the red-giant CH stars, these abundances are consistent with a picture in which carbon and s-process elements were dumped onto the incipient red-giant CH star from an AGB star in which the C-13(alpha,n)O-16 reaction was the source of neutrons for the s-process. In addition, the abundance patterns in the globular cluster CH star, M22 III-106, have been analyzed. It is found to have an abnormally large carbon abundance, but the C/O ratio is much less than unity and the star shows no evidence for enhanced abundances of the s-process elements. Therefore, M22 III-106 is most likely not a CH star in the sense that term is applied to galactic CH stars. The most probable explanation for the carbon overabundance in M22 III-106 is that CN processing has not been as complete in this star as in other giants of similar composition in M22.

A MULTI WAVELENGTH OBSERVATIONAL STUDY OF THE CARTWHEEL RING GALAXY Ph.D. Thesis

James Lloyd Higdon 1993 254 p

Avail: Univ. Microfilms Order No. DA9323424

Ring galaxies are examples of extended starbursts triggered by a collisionally induced ring density wave. Because of their highly extended rings, high rates of inferred star formation, and the simplicity of the density wave, they offer advantages for the study of the starburst phenomenon. This work presents an observational investigation of the Cartwheel, a large and gas rich ring galaxy. CCD imagery in the H alpha, H beta, and (OIII) lambda 5007 emission lines is used to map the distribution and intensity of massive star formation and to determine properties in the HII regions. Off-line imagery is used to map the continuum intensity and color variations and to probe the stellar populations. VLA observations in the 21 cm line of hydrogen are used to measure the distribution and kinematics of the neutral atomic gas in the ring galaxy and its companions. Radio continuum mapping at 20 cm and 6 cm provides independent and extinction free tracers of massive star formation. Finally, (12)CO(1-0) observations are presented that constrain the mass of molecular gas in the starburst. The main conclusions of this study are: The Cartwheel's outer ring is experiencing a moderate starburst, though massive star formation is not measured anywhere else in the galaxy. A large radial color gradient spans the Cartwheel's disk, a fact consistent with a propagating starburst leaving large numbers of young massive stars in its wake. The observations are consistent with the outer ring triggering the first major episode of star formation. Moreover, the IMF appears biased towards massive star formation in the starburst. While 80 percent of the HI in the Cartwheel is organized into the outer ring, a low surface density distribution fills the interior. Noncircular motions are evident in the Cartwheel's HI velocity field, which are attributed to the infall of gas. Regions not experiencing massive star formation are characterized by low gas surface density, suggesting a threshold effect. Only the Cartwheel's outer ring is above the critical density for the growth of gravitational perturbations. The (12)CO(1-0) upper limit implies that the ISM of the Cartwheel is dominated by atomic gas on large scales.

A STUDY OF RECYCLED PULSARS IN GLOBULAR CLUSTERS Ph.D. Thesis

Stuart Bruce Anderson 1993 106 p

Avail: Univ. Microfilms Order No. DA9325333

We have performed a search for radio pulsars in 11 globular clusters visible from the 305 m Arecibo radio telescope. We have found 11 pulsars in the four clusters: M53, M13, NGC 6760, and M15; each containing one binary pulsar: 1310+18A, 1639+36B, 1908+00A, and 2127+11C, respectively; as well as a total of seven isolated pulsars: 1639+36A, 2127+11B, 2127+11D, 2127+11E, 2127+11F, 2127+11G, and 2127+11H. In this thesis we present the various search strategies employed and discuss the results of pulse time of arrival analysis for the seven isolated pulsars and the binary pulsar 2127+11C, as well as initial Doppler orbits for the binary pulsars 1310+18A and 1639+36B. The remaining pulsar 1908+00A is the subject of current research. The binary pulsar 2127+11C has been found to be in an 8 hour orbit about another degenerate star. The detection of a relativistic precession of the orbit and time dilation

effects constrain the pulsar and companion star masses to be m(sub p) = 1.34 +/- .23 solar mass and m(sub c) = 1.37 +/- .23 solar mass. Study of the radial positions and anomalous spin period derivatives of the seven isolated pulsars in M15 has revealed otherwise unobtainable information on the structure of this post core collapsed globular cluster. From the observed spatial pulsar distribution of n(sub p) varies as r(exp -3), it is inferred that the mass of isolated pulsars in M15 is approximately 1.4 solar mass. From the negative period derivative of PSR 2127+11A,D, it is inferred that the central mass-to-light ratio is greater than 1.9 solar mass/solar luminosity(sub U) and the central mass density is greater than 2.7 x 10(exp 6) solar mass pc(exp -3). From the observed isolated pulsar luminosity function in M15, Phi(L) varies as L(exp -0.93), and an assumed minimum luminosity of 1.0 mJy kpc(exp 2), it is inferred that the current population of observable isolated pulsars in M15 is O(100). The observed dispersion measures towards the eight pulsars in M15 and their relative spatial positions indicate that the spectrum of inhomogeneities in the interstellar medium observed at smaller length scales extends up to 10(exp 17) cm. A MULTIWAVELENGTH STUDY OF TWO PROTOTYPICAL SUPERNOVA REMNANTS Ph.D. Thesis
Olaf Vancura 1993 222 p
Avail: Univ. Microfilms Order No. DA9313447

Multiwavelength observations are an important tool in the study of supernova remnants (SNR's) on large and small scales. In this thesis, we perform a detailed analysis of two SNR's, the Cygnus Loop and N49. We have used the Voyager 1 and 2 Ultraviolet Spectrometers to study the far-ultraviolet (FUV) emission from the Cygnus Loop. We find widespread emission from O VI lambda lambda 1032, 1038, and C III lambda 977 and we estimate total luminosities in these lines. We create the first FUV images of this remnant. Nonradiative and incomplete shocks contribute substantially to the FUV emission. We find that shocks with velocities greater than or equal to 160 km/s must be widespread even in the optically bright regions. We present a detailed imaging and spectroscopic study of N49 and find that most of the ultraviolet and optical emission emanates from shocks with velocities less than or equal to 140 km/s. However, O VI emission arises behind shocks with velocities approximately 200 km/s. A power-law shock velocity distribution corresponding to 40 km/s less than or equal to V(sub s) less than or equal to 270 km/s provides a good match to the data. We derive improved abundances for N49 and conclude by discussing implications for the interstellar medium surrounding the SNR. We develop a model invoking a Sedov solution in which the main blast wave also encounters large interstellar clouds. For this model, we demonstrate that the energies of N49's evolution as a whole and blast wave/cloud interactions on a smaller scale are self-consistent. Finally, we have constructed models that for the first time predict the dynamic evolution and emission properties of grains behind nonradiative shock waves. We predict observable IR grain and x ray plasma emissions, and we study the effects of varying the preshock density and shock velocity. Our predictions compare favorably to observations of the Cygnus Loop primary shock at IR and x ray energies. Dissert. Abstr.

HIGH REDSHIFT QSOs AND THE X RAY BACKGROUND Final Report, 15 Feb. - 31 Oct. 1993
Chris Impey 1993 26 p
(Grant NAG5-1867)
(NASA-CR-195112; NAS 1.26:195112) Avail: CASI HC A03/MF A01

ROSAT pointed observations were made of 9 QSO's from the Large Bright Quasar Survey (LBQS). The LBQS is based on machine measurement of objective prism plates taken with the UK Schmidt Telescope. Software has been used to select QSO's by both color and by the presence of spectral features and continuum breaks. The probability of detection can be calculated as a function of magnitude, redshift and spectral features, and the completeness of the survey can be accurately estimated. Nine out of 1040 QSO's in the LBQS have z greater than 3. The observations will provide an important data point in the X-ray luminosity function of QSO's at high redshift. The QSO's with z greater than 3 span less than a magnitude in M(sub B), so can be combined as a homogeneous sample. This analysis is only possible with a sample drawn from a large and complete catalog such as the LBQS. Four of the 9 QSO's that were observed with the ROSAT PSPC for this proposal were detected, including one of the most luminous X-ray sources ever observed. The April 1992 version of the PROS DETECT package was used to reduce the data. The results have been used to search for evolution of the X-ray properties of QSO's in redshift. The 9 QSO's lie in the range -28.7 less than M(sub B) less than -27.8. When combined with data for 16 QSO's in a similar luminosity range at lower redshift correlations with luminosity and redshift can be separated out. The LBQS sample also yields a new constraint on the contribution of high redshift QSO's to the X-ray background. An initial requirement is knowledge of the X-ray properties (alpha(sub OX)) as a function of redshift. Integration over the evolving luminosity function of the LBQS then gives the QSO contribution to the source counts.

A NEAR-INFRARED SURVEY OF THE STAR FORMING REGION NGC 2264 Ph.D. Thesis
Francois Piche 1992 341 p
Avail: Univ. Microfilms Order No. DA9312731

We present the results of a large scale near infrared (J, H, K) survey of the star forming region NGC 2264. The survey covers 48' (Dec) x 27' (RA) with a completeness limit of 15.5, 14.5 and 14 magnitudes at J, H, and K respectively. Complementary observations of NGC 2023, NGC 2068, and NGC 7023 are also discussed. Young stars in NGC 2264 are concentrated in two clusters. The northern cluster is highlighted by the bright star S Mon. The infrared source NGC 2264 IRS, the molecular outflow NGC 2264D and the Cone Nebula are associated with the southern cluster. The northern cluster is divided into two subclusters, the southern cluster has three subclusters. The luminosity functions (LF's) of NGC 2264 subclusters have slopes in the range 0.28-0.30. This is also case for NGC 2068. NGC 2023's LF is shallower (0.21). There is a break in the LF of NGC 7023 around K = 10.5 magnitudes. All LF's are consistent with a Salpeter IMF and a Miller-Scalo IMF. For NGC 7023, we obtain a better agreement with a Miller-Scalo IMF. The differences in LF can be attributed to cluster ages. NGC 2023 is approximately one million years old. NGC 7023 is old enough for its LF to be consistent with a cluster of main sequence stars. The NGC 2264 clusters and NGC 2068 have ages intermediate between NGC 2023 and NGC 7023. A large fraction of LF's have turn-offs at their faint end. These can be interpreted as turn-offs at the low mass end of the corresponding initial mass function. We present a new optical-infrared color-color diagram (V - J vs J - K) that is more efficient at detecting stars with infrared excesses than the infrared color-color diagram (J - H vs H - K). The luminosity function of infrared excess stars in NGC 2264 peaks around K = 11 magnitudes. Finally, we report the detection of a pedestal stellar population in NGC 2264. Dissipation of the main clusters could explain the properties of this stellar population.

PHYSICS, ASTRONOMY, AND ASTROPHYSICS: A NUMERICAL STUDY OF THE BLACK HOLE PLUS BRILL WAVE SPACETIME Ph.D. Thesis
David Harold Bernstein 1993 356 p
Avail: Univ. Microfilms Order No. DA9314846

We investigate solutions of the vacuum Einstein equations in space-times containing a single Einstein-Rosen bridge. The physical and geometrical content of the Schwarzschild solution is analyzed in a number of different spacetime coordinate systems, some well known and some new. In addition, the accuracy of numerical schemes for solving the evolution equations is studied. The same numerical methods are then used to construct axisymmetric solutions which correspond to a Schwarzschild black hole in the presence of time symmetric gravitational radiation (which we call 'Brill waves'). The initial data, evolution of perturbations, and evolution of large amplitude waves are discussed in detail. The initial data is found to display some of the properties of similar data sets studied in the past. The perturbation solutions are shown to agree with known black hole perturbation theory results to within a few percent. Some new results about the apparent horizon in the perturbed Schwarzschild solution are displayed (e.g., the apparent horizon undergoes oscillations similar to that of a damped harmonic oscillator). In addition, traditional radiative variables used in numerical relativity are matched against the known radiative variables of perturbation theory and good agreement is reached in most cases. The large amplitude wave space times are then studied by examining the behavior of the

apparent horizon and by investigating the nature of the waveforms as the amplitude is increased into the 'nonlinear' regime. It is found that the apparent horizon may undergo severe distortions by collision with a large amplitude wave. The total mass loss in radiation is studied and it is shown that in some cases a large amount of the initial radiation may escape to null infinity. Dissert. Abstr.

INFRARED OBSERVATIONS OF COMETARY DUST BY COBE Ph.D. Thesis
Carey Michael Lisse 1992 345 p
Avail: Univ. Microfilms Order No. DA9315684

The COBE/Diffuse Infrared Background Experiment (DIRBE) is a 0.7 degree x 0.7 degree broadband absolute photometer covering the wavelength range 1 to 240 micrometers. During its November 1989-September 1990 all-sky survey, DIRBE detected the comets C/Okazaki-Levy-Rudenko (C/OLR), C/Austin, P/ Schwassmann-Wachmann 3 (P/SW-3), and C/Levy, providing unique near to far infrared photometry and large-scale images for these comets. The observations of C/Austin were the most detailed, as the comet exhibited an approximately 7 degree long, highly structured dust tail at 12 and 25 micrometers. The lack of a similar visible tail, the results of dynamical modeling of the tail morphology, and the near-greybody behavior of the observed spectra suggest a dust particle surface area distribution dominated by large particles. Compared to visible estimates, a relatively large dust mass loss rate is found for C/Austin. C/OLR and C/Levy were detected only as line sources extended approximately 2 degrees in the antisolar direction, but exhibited interesting infrared spectra. The spectra of C/OLR were very similar to C/Austin. The spectra of C/Levy were very different, exhibiting an elevated color temperature, a fall-off in grain emissivity at long wavelength, and a particle size distribution dominated by small particles. Interestingly, C/Levy was the only one of the four comets found by other observers to have a pronounced light curve and significant activity. P/SW-3 was detected only as a low S/N point source. The mere detection of the comet is interesting, as four other visibly brighter comets were not detected by DIRBE. This suggests an enhancement of the infrared flux of this comet, possibly due to the presence of a dust trail. Comparison of the DIRBE data for these comets suggests that the observed differences are due to particle size effects, not compositional variations. Cometary dust emission is found to be an important source of the zodiacal cloud if the mass emission rate for C/Austin is typical for all gassy comets. The estimated lower limit for the dust/gas ratio of these comets is 0.1 to 0.5. Dissert. Abstr.

RECONSTRUCTION OF STELLAR IMAGES FROM CORRELATIONS Ph.D. Thesis
Xiaotian Shi Sep. 1993 149 p
(ISBN-0-315-85382-4; CTN-94-61153) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The problem of object reconstruction from a series of short exposure astronomical data observed by ground-based telescopes is addressed. An approach using the self cross correlation is proposed and implemented. This is defined as the cross correlation between an image observation and a truncated part of it. The relation among the phase of the cross spectrum, the phase of the object, and the edges in the object are established. Based on these relations, some efficient and effective algorithms for retrieving the unknown phase of the object and its modulus are developed. These algorithms are found to be insensitive to noise. The phasor image (the inverse Fourier transform (FT) of the phasor part of the FT) of the self cross correlation is shown to preserve the edges of the unknown object. If all the stars and sub-objects in the object have edges, a phase retrieval method based on the iterative FT method is proposed. If some of those objects have edges, a non-iterative phase retrieval method is developed, and if none have edges, a modified version is used to retrieve the object phase. The approach can be extended to reconstruct an object under anisoplanatic atmospheric turbulence. A comparison of signal to noise ratios obtained using the proposed method and existing reconstruction methods demonstrates the superiority of the proposed method.

A study was conducted to verify the presence of intermediate age stars within the field of the Fornax dwarf galaxy and to attempt to confirm the very large metallicity interval among the various globular clusters which this galaxy contains. If this interval is found to be real, it would be then possible to make use of it to calibrate the Sandage Oosterhoff effect which links the metallicity of an old population to the luminosity of its horizontal branch. Color magnitude diagrams are produced of the different regions observed in order to determine, using isochronous curves, the different parameters of the stellar populations in question. It is concluded that the Fornax field is populated with intermediate age stars of which the youngest have about 1 Ga. The absence of a blue horizontal branch indicates that there are no old stars (greater than 10 Ga). This population of the field also shows a large metallicity interval, Fe/H less than -1 and greater than -2. As for the clusters, they are probably very old (presence of a blue horizontal branch) and poor in metals. The metallicity interval among them is perhaps not as large as believed. CISTI

MULTICOLOR PHOTOMETRY OF BARRED SPIRAL GALAXIES Ph.D. Thesis
William Douglas Horst 1992 196 p
Avail: Univ. Microfilms Order No. DA9327834

We present BVRI surface photometry for six barred spiral galaxies. B-V and R-I color maps are used to investigate stellar populations of the bar and nucleus. Results suggest a difference between the nucleus and bar populations, albeit minor. Nuclear and bar populations correspond roughly to integrated spectral types of early K-type and late G-type giants, respectively. In all galaxies, surface brightness profiles suggest star formation activity is occurring near the ends of the bar. In addition, color indices in the central regions of all but one galaxy suggest active star formation within the nucleus. Within the central 5 arc seconds of all but one galaxy, both B-V and R-I color indices become bluer than surrounding regions. Examination of 2-color diagrams strongly suggests the effect of interstellar extinction is uniform along the bar and nucleus. Dissert. Abstr.

OPTICAL DEPTH EFFECTS IN CLUSTER COOLING FLOWS Ph.D. Thesis
Michael Wayne Wise 1992 258 p
Avail: Univ. Microfilms Order No. DA9324889

In this thesis, we focus on several sources of opacity in cluster cooling flows and examine how they affect both what we see and what we interpret from these objects. In Chapter 2, we derive a technique for obtaining distances to cluster cooling flows using observations of electron scattered light. The majority of cluster cooling flows contain a centrally dominant galaxy at the center of the flow, and many of these galaxies contain active galactic nuclei (AGN). Typically 1 percent of the radiation from this central source will be scattered into our line of sight by hot electrons in the surrounding cooling flow. Observations of this electron scattered radiation may be used in combination with the X-ray surface brightness to determine an independent distance to the cluster. In Chapter 3, we discuss how this scattered radiation can provide information on the cluster environment and the central AGN. Specifically, we consider inhomogeneous gas distributions or situations where the central AGN varies with time, exhibits beaming, or emits polarized radiation. The remainder of this thesis addresses the effects of photoionization and resonant line opacity on the X-ray properties of cluster cooling flows. In Chapter 4, we calculate X-ray luminosities, surface brightness profiles, spectra, and line profiles, both spectral and spatial, several model cooling flows. These models serve as a useful comparison point for models including the effects of X-ray opacity. As we show in Chapter 4, the assumptions one makes concerning how the gas cools out of the intracluster medium can produce drastic differences in many of the observed X-ray properties for these objects. Finally in Chapter 5, we recalculate the X-ray properties for the models

discussed in Chapter 4 including the effects of the radiative transfer through the ICM. The numerical technique employed to solve the transfer equation is discussed in some detail in Appendix D. Dissert. Abstr.

PUSHING THE LIMIT: PRECISION RADIAL VELOCITIES, TECHNIQUES, AND APPLICATIONS Ph.D. Thesis
Robert Paul Butler 1993 121 p
Avail: Univ. Microfilms Order No. DA9327393

A description is given of an instrument that makes use of an iodine absorption cell, a coude echelle spectrograph, and a sophisticated software analysis package to reduce relative radial velocity errors by two orders of magnitude. Short and long term errors have been reduced to 5 and 20 m/s respectively. Work continues on new software techniques to reduce long term errors to less than 10 m/s. A method of deducing the instrumental point spread function directly from observation is also introduced. Three applications of this technique are covered. Perhaps the most exciting application is the search for sub-stellar companions to solar type stars. The presence of a Jupiter-like planet can be indirectly detected in orbit about a solar type star from the reflex motion of the star. For example, Jupiter induces a 13 m/s velocity on the Sun. Marcy and Butler have been monitoring about 100 solar type stars over a 5 year period. Historically it has not been possible to search for small amplitude variable stars by means of radial velocity change because of measurement error. Using an iodine cell, the accuracy of radial velocity measurements surpasses that of photometric techniques. A survey is being made of stars previously thought to be stable that lie in or near the Cepheid instability strip. This survey has uncovered the smallest amplitude Cepheid yet known. The iodine cell has been used to obtain radial velocity curves from several hundred optical absorption lines in four bright Cepheid variable stars. Differential velocities between various classes of lines reveal detail about the atmospheric structure of Cepheids and provide the raw information needed to construct detailed physical models. As a first order correction to the Barnes-Evans/Baade-Wesselink method, it is suggested that the amplitude of radial velocity curves be reduced by 10 percent to better match the motion of the continuum forming region. With the exception of the Na D lines, these observations reveal no unambigous examples of line splitting. The shape and amplitude of the radial velocity curve of delta Cep is shown to have been extremely constant over most of the last century.

SPECTRAL AND TEMPORAL BEHAVIOR OF LOW MASS X RAY BINARIES OBSERVED WITH THE EINSTEIN SSS AND MPC, AND THE BROAD BAND X RAY TELESCOPE Ph.D. Thesis
Damian Joseph Christian 1993 300 p
Avail: Univ. Microfilms Order No. DA9327400

An extensive survey of 50 low mass X-ray binaries was carried out using the HEAO-2 Einstein Solid State Spectrometer data (0.5-4.5 keV) with the Monitor Proportional Counter data (1.2-20.0 keV). The SSS provided 160 eV resolution below 4.5 keV with about 200 sq cm of area, 100 times that of grating instruments on Einstein and EXOSAT. Additional observations were obtained with the Broad Band X-Ray Telescope (0.5-12 keV). Although LMXRB are some of the most luminous X-ray sources and include one of the first X-ray sources discovered, the nature of their emission regions has remained uncertain. Spectra were selected on the basis of intensity and fit with a set of simple and complex spectral models. For all the subclasses, including Eddington-limited bulge sources, bursters, dippers, the soft spectrum black hole candidates, and a few transients in decline, the spectra could be fit acceptably with combinations of thermal bremsstrahlung and blackbody spectra or a Comptonized spectrum and a blackbody. The results rule out optically thick disk models for the bright Z sources and power law models for bursters. The results suggest a progression of spectra as a function of X-ray luminosity for the bursters, Atoll, and Z sources, in which there are separate emission regions, one optically thin to scattering. The optically thick component that appears for higher luminosity may be due to a boundary layer or to high optical depth to scattering in the flow. A lower temperature blackbody indicated in some cases could be an expected contribution from the accretion disk. The soft spectrum sources are dominated by blackbody spectra, but for two, low effective area of emission is a problem for the black hole interpretation. There did not appear to be any clear selection between models for the sources with high binary orbit inclinations. Column densities for absorption by cold gas were determined simultaneously with the fits. They give distance estimates for the galactic bulge sources on the basis of a galactic disk model. The strongest of previously reported low energy X-ray lines due to OVIII or Fe L transitions are confirmed. Similar line emission is seen for several other sources. The source X0614+091 exhibited a large emission feature consistent with being due to OVIII, showing that a low luminosity disk accretor can have a disk corona. For Cyg X-2 a broadened emission line centered on 6.7 keV was measured with BBXRT. It has been interpreted as K lines from Fe XXV emitted and scattered in the photoionized gas in the inner part of an accretion disk corona photoionized by the central X-ray source. Upper limits for line emission were obtained for X0614+091 and M15 which are consistent with the coronal model. Dissert. Abstr.

EQUATION OF STATE OF NEUTRON STAR MATTER, LIMITING ROTATIONAL PERIODS OF FAST PULSARS, AND THE PROPERTIES OF STRANGE STARS
F. Weber (Technische Univ., Munich, Germany.) and N. K. Glendenning 25 Oct. 1993 15 p Presented at the NATO Advanced Study Institute on Hot and Dense Nuclear Matter, Bodrum, Turkey, 26 Sept. - 9 Oct. 1993
(Contract DE-AC03-76SF-00098)
(DE94-005214; LBL-34783; CONF-930999-4) Avail: CASI HC A03/MF A01

The present status of dense nuclear matter calculations and constraints on the behavior of the associated equation of state at high densities from data on rapidly rotating pulsars is reviewed. Recent finding of the likely existence of a mixed phase of baryons and quarks forming a coulomb lattice in the dense cores of neutron stars is discussed. A review of important findings of recently performed calculations of rapidly rotating compact stars is given. These are constructed in the framework of general relativity theory for a representative collection of realistic nuclear equations of state. The minimum possible rotational periods of gravitationally bound neutron stars and self-bound strange stars are established. Its knowledge is of fundamental importance for the decision between pulsars that can be understood as rotating neutron stars and those that cannot (signature of hypothetical self-bound matter of which strange stars are the likely stellar candidates). The properties of sequences of strange stars are investigated. Specifically, the question of whether such objects can give rise to the observed phenomena of pulsar glitches is answered, which is at the present time the only astrophysical test of the strange quark matter hypothesis.

EQUATION OF STATE OF STELLAR PLASMAS
F. J. Rogers Jun. 1993 29 p Presented at the Equation of State in Astrophysics Workshop, Saint-Malo, France, 14-18 Jun. 1993
(Contract W-7405-eng-48)
(DE94-004186; UCRL-JC-115702; CONF-9306287-1) Avail: CASI HC A03/MF A01

The equation of state (EOS) of astrophysical plasmas is, for a wide range of stars, nearly ideal; with only small non-ideal Coulomb corrections. Calculating the EOS of an ionizing plasma from a ground state ion, ideal gas model is easy, whereas, fundamental methods to include the small Coulomb corrections are difficult. Attempts to include excited bound states

are also complicated by plasma screening and microfield phenomena that weaken and broaden these states. Nevertheless, the high quality of current observational data, particularly seismic, dictates that the best possible models should be used. The present article discusses these issues and describes how they are resolved by fundamental many-body quantum statistical methods. Particular emphasis is placed on the activity expansion method that is the basis of the OPAL opacity code. Some comparisons with standard methods are given. DOE

(DE94-005156; LA-UR-93-4397; CONF-930960-7) Avail: CASI HC A02/MF A01

Production rates of cosmogenic nuclides made in situ in terrestrial samples and how they are applied to the interpretation of measured radionuclide concentrations were discussed at a one-day Workshop held 2 October 1993 in Sydney, Australia. The status of terrestrial in-situ studies using the long-lived radionuclides Be-10, C-14, Al-26, Cl-36, and Ca-41 and of various modeling and related studies were presented. The relative uncertainties in the various factors that go into the interpretation of these terrestrial in-situ cosmogenic nuclides were discussed. The magnitudes of the errors for these factors were estimated and none dominated the final uncertainty. DOE

DUST IN THE SMALL MAGELLANIC CLOUD Progress Report, 1 Nov. 1993 - 15 Apr. 1994
Antonio Mario Magalhaes 27 Apr. 1994 5 p
(Grant NAG5-1463)
(NASA-CR-195764; NAS 1.26:195764) Avail: CASI HC A01/MF A01

Observations of reddened stars in the Small Magellanic Cloud (SMC) indicate that the interstellar grains in that galaxy may show distinct optical properties from those in the galaxy. The ultimate aim of this research is to determine the extinction law in the direction of these three objects, correlating the results with polarimetric data and building dust models that fit both extinction and polarization. UV extinction and optical polarization data suggest that stars with the 'typical' SMC extinction, i.e., with no bump at bluer wavelengths than the galaxy, have wavelengths of maximum polarization smaller than the galactic average. This shows that the carbon abundance is not the only parameter distinguishing the dust properties for the galaxy and the SMC, the grain size distribution being another distinguishing factor. THE THERMAL CONSEQUENCES OF GIANT IMPACTS IN THE EARLY SOLAR SYSTEM Ph.D. Thesis
William Brian Tonks 1993 298 p
Avail: Univ. Microfilms Order No. DA9322636

Recent advances in understanding planetary formation indicate that mass and energy accumulation are dominated the impact of objects containing up to several percent of the protoplanet's mass. This work examines consequences of such 'giant' impacts, including the initiation of core formation and the development and subsequent evolution of deep magma oceans. Large, high speed impacts on silicate planets with masses greater than approximately 10(exp 23) kg result in formation of intact melt regions. Iron rapidly settles to the melt region's base, forming a negatively buoyant mass. If the differential stress generated by this mass is too large, it overcomes the elastic strength of the mantle beneath and rapidly forms a core. The same process might also trigger differentiation of the largest known icy bodies. A melting model based on the Hugoniot equations empirical particle velocity-distance, and linear shock-particle velocity relationships was developed. Impact-induced core formation occurs in silicate planets with masses between 1-6 x 10(exp 23) kg. Thus, the largest planetesimals that accreted to form the Earth were already differentiated. Impact-induced core formation may occur in icy bodies as small as Triton, if an intact melt region forms on bodies that small. If the icy bodies accreted high speed, heliocentric particles, core formation can be triggered in somewhat smaller bodies. Giant impacts do not explain whole-body differentiation of asteroid sized bodies. Giant impacts on large terrestrial planets can form magma oceans 1000-2000 km deep. It is widely assumed that such a magma ocean necessarily differentiates by fractional crystallization. Scientists making this assumption have not accounted for the possibility that crystal suspension in a planetary scale convecting system may prevent crystal-magma separation. It is shown that crystals less than 1-2 cm in diameter are suspended from the onset of cooling. Surprisingly, the ability of a magma ocean to suspend crystals is only weakly dependent on gravity and depth. The difference in magma ocean evolution between the Earth and Moon may be due to gravity's effect on the solidus, liquidus, and adiabatic temperature profiles. Dissert. Abstr.

BINARY-SINGLE STAR SCATTERING: AN INVESTIGATION OF A REALISTIC CHAOTIC SCATTERING SYSTEM Ph.D. Thesis
Patricia Therese Boyd 1993 232 p
Avail: Univ. Microfilms Order No. DA9319724

The scattering interaction between a bound pair of stars (a binary) and a single star plays an important role in the evolution of globular star clusters. We investigate binary-single-star scattering as an example of a realistic chaotic scattering encounter, concentrating on the character of the space of initial values onto which exit parameters are mapped. In this space, regions of simple behavior -- ejection of one of the stars after a single close approach of the incoming star -- are separated from each other by regions of resonance, in which a temporarily bound triple system is formed. We present a number of distinct slices of initial-value space and discuss the evolution of the resonance regions as a function of the total energy of the system and of the mass ratios of the stars. In addition, statistical properties are studied as a function of these parameters. The initial-value space boundaries between regions of simple ejection and resonance are found to be smooth, and an explanation is given for why this is so. In the direction perpendicular to these smooth boundaries, the structure of the resonance regions is discontinuous, composed of a nested structure of smooth bands separated from one another by random-looking bands. This structure persists to arbitrary scales. The bands are found to be distributed in a Cantor-set-like way, and are associated with the number of bound excursions described by the three particles before eventual ejection. Based on a straightforward dynamical argument, we derive an expression for the scaling of the bands. The fractal properties of the resonance regions are investigated as a function of the total energy and of the mass ratios. The fractal dimension is found to be insensitive to the total energy of the system, and sensitive to the mass ratio of the incoming star. We explain this in terms of each star's probability of escaping from the system once bound, which is also a function of mass ratio. The dynamics of some long-lived interactions is investigated by studying the total kinetic energy as a function of time. This scalar function is found to contain a wealth of information about the interaction, and based upon this information, we apply a symbolic dynamics to the orbits. This is found to be useful in determining which orbital resonances, defined for our purposes in terms of the ratios of the two orbital frequencies, the system stays near.

PHYSICAL CONDITIONS IN CLASSICAL H2 REGIONS IN THE MAGELLANIC CLOUDS Ph.D. Thesis
Eric Matthew Wilcots 1992 370 p
Avail: Univ. Microfilms Order No. DA9312761

Presented is an analysis of the physical properties of a sample of classical H2 regions in the Magellanic Clouds. The morphology, H(alpha) luminosity, flux of Lyman continuum photons, spectral type of ionizing source(s), electron temperature, electron density, and dust content, the primary parameters upon which H2 regions can be compared, are considered. The results presented here show that H2 regions in the clouds bear a close resemblance to similar Galactic H2 regions such as Orion. The primary exception to this is that the electron temperatures in this sample of H2 regions are systematically higher than those found in similar Galactic H2 regions. These classical H2 regions are found to be primarily ionized by a single massive star; in the brighter H2 regions the source of ionization tends to be of spectral type O5-O7, while the fainter H2 regions are primarily ionized by a B0-O9 star. In most cases the main ionizing source is accompanied by several other stars of equal or later spectral type. The

data also shows that the amount of interstellar extinction varies from one star-forming region to the next and suggests that the dust distribution is clumpy and internal to the H2 regions. In addition to these general trends, evidence for the presence of low-velocity shocks exists in at least one H2 region. Four of the H2 regions in this sample are dominated by bright, compact cores, and the data suggests that these are unevolved H2 regions. Given the observational results of this thesis, the optical spectra of these H2 regions are well fit by the standard H2 region models. Taken together, a wide array of observational data and the theoretical models provide a detailed description of the physical conditions within H2 regions.

THE STRUCTURE OF SOLAR MAGNETIC FIELDS AND THEIR ASSOCIATED ELECTRIC CURRENTS Ph.D. Thesis

Ladye Kathryn Wilkinson 1992 136 p

Avail: Univ. Microfilms Order No. DA9312026

The threads of magnetic flux which permeate the solar atmosphere are known to play several important roles in the activity of the Sun. Most notably, it is the excess energy stored in these magnetic fields which powers the violent eruptions known as flares. The presence of free energy in active regions of magnetic flux is evidenced by observations of 'magnetic shear' and of electric currents present in the regions. This dissertation considers several topics related to the structure of active region magnetic fields, observations of magnetic shear, and measurements of electric currents flowing in the magnetic fields of active regions. First, we consider the problem of modeling the structure of the loops of magnetic flux. We find solutions to the force-free equation for slightly bent, thin flux tubes and evidence that the effects of curvature on force-free flux tubes may in fact contribute to their stability. The implication is that the critical twist of flux tubes may be higher than previously thought and thus that greater amounts of energy may be stored within these loops. Our second endeavor is to find reasonable limits under which the evaluation of magnetic shear may be made using the observed photospheric magnetic field of active regions. The calculation of magnetic shear relies upon simplifying assumptions to overcome the problem of noise in magnetic field data. Under these assumptions, the calculation of magnetic shear is subject to projection effects which become significant for regions located away from the center of the solar disk. We demonstrate, using an analytical force-free field model, that the calculation of shear is valid only for regions within 15 deg of disk center. Lastly, we concern ourselves with the measurement of electric currents flowing in active regions. We demonstrate that previously used methods of measuring current densities from magnetic field measurements using the differential form of Ampere's law are highly vulnerable to the high noise levels of magnetic field data. We propose, instead, an integral method, arguing that it is less susceptible to the noise levels. Our aim is to demonstrate the great need for reliable measurements of the electric currents flowing in active region magnetic fields.

NUMERICAL SIMULATIONS OF CLUSTER COOLING FLOWS Ph.D. Thesis

Eric Andrew Lufkin 1992 170 p

Avail: Univ. Microfilms Order No. DA9237501

Time-dependent effects for cluster cooling flows are examined in the cases of 1-D spherical symmetry and 2-D axisymmetry. Physical effects included in the simulations are radiative cooling, mass deposition and time-dependent gravitational potentials. The gravitational potential is assumed generally to be due to three sources: a smooth cluster distribution, a massive central galaxy, and in the 2-D case, a perturbing galaxy on a radial orbit. A 2-D axisymmetric finite difference code is developed and tested for these applications. At modest resolution, the code is accurate to one tenth of one percent in the fundamental fluid variables, making it a good tool for observing wave phenomena and departures from spherical symmetry. In the 1-D case, flows with mass deposition reach a steady state after an initial central cooling time. The mass accretion rate generally remains nearly constant thereafter. The spatial structure of the flow agrees in detail with previous steady-state models. Even if the cluster potential is allowed to deepen with time, it is found that adiabatic compression delays neither the cooling of the gas nor the onset of steady-state flow. On the other hand, flows for which the self-gravity of the gas is dynamically important are shown to be unstable to collapse on a hydrodynamic timescale. Despite the relative success of the spherical model, there is considerable observational evidence that the cooling accretion takes place preferentially in clumps rather than uniformly. Recent ROSAT images also indicate that the gas in clusters is nonuniformly distributed. We therefore investigate the formation and evolution of finite-amplitude and finite-wavelength disturbances through axisymmetric numerical simulations of cluster cooling flows perturbed by a single galaxy orbiting along the symmetry axis. A STUDY OF WHITE DWARF RADIATIVE ACCRETION SHOCKS Ph.D. Thesis

Hussain Yousef Rashed 1992 319 p

Avail: Univ. Microfilms Order No. DA9313313

Quasi-periodic oscillations (QPO's) of period of 1-3 seconds, with root mean square amplitude 1-3 percent have been discovered in the optical emission from four AM Her objects, AN UMa, V834 Cen, VV Pup, and EF Eri. Middleditch (1982) suggested that the QPO's were due to the oscillatory instability of radiative shocks discovered by Langer, Chanmugam, and Shaviv (1981). If the QPO's are due to shock oscillations then the QPO's can be used to constrain several fundamental parameters of the AM Her QPO systems such as the mass and magnetic field strength of the white dwarf. Unfortunately, it is not clear if the QPO's are due to the oscillatory instability. The QPO's are found only in the optical portion of the spectrum and, thus, presumably, are due to variations in the cyclotron luminosity of the shock. Prior to this work, no detailed calculations of the cyclotron (optical) emission from accreting white dwarfs have been performed. Chanmugam et al. (1985) presented calculations for the cyclotron emission of white dwarf shocks, but they did not self-consistently solve the radiative transfer and hydrodynamic equations. This work provides theoretical results for the stability properties and the optical spectra of white dwarf radiative accretion shocks for the weak cyclotron case thought to apply to the AM Her objects. Comparison of these results with observations of the AM Her QPO sources suggests that the properties of the shock oscillation model, in its current form, are not compatible with observations. Namely, radiative shocks with parameters typical of the AM Her QPO sources probably cannot sustain limit cycle oscillations due to strong cyclotron emission and/or electron thermal conduction. However, because several aspects of the observations are naturally explained as shock oscillations, it may turn-out that shock oscillations, in some guise, are responsible for the QPO's.

THE KINEMATICS OF MOLECULAR GAS AND DUST IN THE NEARBY GALAXIES CENTAURUS A AND M82 Ph.D. Thesis

Alice C. Quillen 1993 139 p

Avail: Univ. Microfilms Order No. DA9325382

This thesis presents a kinematical study of the molecular gas and dust in the nearby radio galaxy Centaurus A (NGC 5128) and the nearby starburst M82. The CO (2-1) emission along the inner dust lane of Centaurus A, shows the molecular gas to be in a thin disk, with a low velocity dispersion. The profile shapes are inconsistent with planar circular and noncircular motion. However, a warped disk in a prolate potential provides a good fit to the profile shapes. Near infrared images of Cen A (NGC 5128) in the J, H, and K bands are presented. The infrared morphology is primarily determined by the presence of a thin absorptive warped disk. By integrating the light of the underlying prolate galaxy through such a disk, we construct models which are compared to infrared and X-ray data. A scenario is proposed where a small gas rich galaxy infalling under the force of dynamical friction is tidally stripped. Stripping occurs at different times during its infall. The orientation of the resulting gas disk depends upon the angular momentum of the infalling galaxy. We find that the resulting precession angle of the disk is well described by the precession model, but that the inclination angle may vary as a function of radius. We propose an orbit for the infalling galaxy that is consistent with the geometry of the warped disk needed to fit our infrared data, and rotation observed in the outer part of the galaxy. The kinematics of the molecular gas in the nearly edge-on disk in M82 are modeled by considering velocity and surface density perturbations caused by a possible rotating kpc long bar. A model with a bar fits the molecular observations of the inner torus remarkably well. The clouds have a low cloud-cloud velocity dispersion implying that the disk is unstable to short timescale axisymmetric perturbations. This is

consistent with the hypothesis that the high star formation efficiencies in starbursts are due to the short timescales of gravitational instability. It is likely that the bar has mediated the starburst. Dissert. Abstr.

THE ROLE OF CLOUD COLLISIONS IN N-BODY SIMULATIONS OF DISK GALAXIES Ph.D. Thesis
Mario Klaric 1993 243 p
Avail: Univ. Microfilms Order No. DA9325203

I have created a cloud collision recipe for use in N-body, polar grid, 3-d code. As a result of collisions two clouds can undergo one of four major processes: coalescence, fragmentation, star formation, and dynamical disturbance. I tested my recipe in simulations of disk galaxies, both isolated and interacting. In cases of isolated disks, I have found that cloud collisions play a key role in bulge formation by scattering stars out of the disk plane, which then end up forming a bulge. I have also shown that cloud collisions turn an initially uniform cloud size spectrum into an exponential size spectrum, agreeing very well with observations by Solomon and Rivolo (1989). In addition, I have shown that a disk needs to have a stellar component to form a bar. The bar then often has blobs at its ends, primarily composed of older stars. As a case of interacting disks, I have studied NGC 2535/6, and found that it seems the primary stayed relatively isolated for a few rotation periods, and consequently relaxed to some degree. Then the companion started tidally interacting with the primary, changing its morphology, intensifying cloud collision rates, and bringing about an earlier onset of star formation, which does not reach the same maximum value as in comparable isolated disk. SURFACE DIFFERENTIAL ROTATION IN A SAMPLE OF COOL DWARF STARS Ph.D. Thesis
Robert Andrew Donahue 1993 231 p
Avail: Univ. Microfilms Order No. DA9323939

A study of rotation in lower main-sequence stars has been progressing at Mount Wilson Observatory since 1980. The rotation program is part of a long-term study of stellar activity cycles, akin to the 11-year sunspot cycle. This dissertation uses the available time series of Ca II H and K chromospheric data in an attempt to uncover information on surface differential rotation in a sample of stars (including the Sun) based upon frequent and reliable measurements of rotation. A method is developed to diagnose the potential contribution of active region growth and decay within an observing season. The existence of surface differential rotation is perceived and analyzed for 37 stars. For some stars, patterns of rotation versus level of mean activity are apparent, and are interpreted to indicate the existence of migrating dynamo waves. The evolution of surface differential rotation is suggested from results based on stars of different ages. Specific results include: (1) there is a power-law relationship between rotation and fractional differential rotation with exponent 3/4; (2) there appears to be an abrupt change in differential rotation morphology and dynamo number which occurs at P(sub rot) approximately equals 10 days. One of these morphologies coincides with stars bordering the Vaughan-Preston Gap; (3) For fast-rotating stars, active regions appear to prefer high-latitude belts, as inferred from the shape of their seasonal time series; and (4) some slowly-rotating stars do show the same equatorward migration pattern over the activity cycle as the Sun. However, an equal number of slowly-rotating stars show poleward (anti-solar) migration. It remains to be seen whether this is caused by some physical difference between these stars or is time-dependent. A model for time series fitting is examined, and its limitations are discussed. The problem of determining the chromospheric contrast is outlined using high-resolution spectroscopy of the Ca II K line of the Sun and stars. Dissert. Abstr.

INFRARED PROPERTIES OF OBSCURING DUST TORI IN ACTIVE GALACTIC NUCLEI Ph.D. Thesis
Edward A. Pier 1993 118 p
Avail: Univ. Microfilms Order No. DA9313416

A new algorithm for radiative transfer in axisymmetric geometries is presented, and it is applied to the optically thick, compact, dust tori which are thought to surround many active galactic nuclei. The general trends exhibited by the spectra of these tori are discussed and compared with observations of active galactic nuclei. Also, the radiation pressure within the torus and its role in supporting the torus are investigated. The spectra emitted by compact tori are basically 'bumps' which are consistently about 50 percent wider than blackbodies and peak in the mid infrared. They radiate anisotropically throughout the infrared, and their infrared color temperatures vary with viewing angle by approximately 100 K. The 10 micron silicate feature often associated with dust can appear in absorption, emission, or not at all. A comparison with observations reveals a good correspondence between the model predictions and the following: the continuum and near IR size of the nucleus of NGC 1068, the 3.5 to 10.5 micron colors of type 2 Seyferts, the 10 micron silicate feature as well as the 8 to 13 micron spectral index in both types of Seyferts, and the anisotropy of the emission from active galactic nuclei. Furthermore, the effective temperature of the nuclear radiation on the inner edge of the torus is about 600 K, and tori typically cover about 86 percent of the solid angle around the nucleus. In type 1 Seyferts and quasars the observed 3.5 micron fluxes are often a factor of a few larger than predicted by the models. This is explained by a small amount of low angular momentum material which approaches much closer to the central engine than the bulk of the torus and radiates near 3 microns. This hot dust is obscured by the torus in narrow line active galactic nuclei. The radiation force within the torus is likely to be comparable to the gravity of the central engine. It may therefore alleviate a theoretical problem of the compact torus model by supporting its geometrical thickness. It may do this both directly and by driving the random motions of the clouds in the torus. Dissert. Abstr.

THE STABILITY OF PERFECT ELLIPTIC DISKS Ph.D. Thesis
Stephen E. Levine 1992 80 p
Avail: Univ. Microfilms Order No. DA9306467

Two dimensional perfect elliptic disk models with maximum streaming were tested for stability by N-body integration. The perfect elliptic disks are the two dimensional limiting case of the perfect ellipsoids, integrable triaxial potentials with the density stratified on concentric ellipsoids, which could be viewed as models for both galactic bars and elliptical galaxies. To obtain a discrete representation of each model suitable for testing by N-body methods, we used simulated annealing to choose a set of orbits which sampled the distribution function. Quiet start techniques were developed to place particles on these orbits uniformly on the torus in action-angle space, which makes the initial conditions as smooth as possible. We found that the nearly axisymmetric models exhibited spiral instabilities similar to those seen in cold disks; the most elliptical models showed bending instabilities. Between these extremes, there is a range of axial ratios from b/a = 0.715 to 0.250 for which these models appear to be stable. All of our methods can easily be extended to three dimensions. On the basis of these experiments, we expect that the moderately triaxial perfect ellipsoids should also be stable. Dissert. Abstr.

CORONAL TEMPERATURES OF UNUSUALLY ACTIVE K-DWARF BINARY SYSTEMS
Robert A. Stern 1 Mar. 1994 10 p
(Contract NAS5-32079)
(NASA-CR-189335; NAS 1.26:189335) Avail: CASI HC A02/MF A01

We report the results of a ROSAT pointed study of 4 BY Dra systems. Good quality pulse-height spectra are available from all four systems. Except for a required interstellar absorption component in HD 319139, the four systems have remarkably similar x-ray spectra; the two systems BD +22deg.669 and BD +23deg.635 look virtually identical in x rays. Analysis of the 4 x-ray spectra reveals that, in all cases, a single-temperature hot plasma (RS or Mewe) spectra is inadequate to fit the data, and two temperatures are required. We present examples of fitted pulse-height spectra and chi squared contours in kT(sub 1)-kT(sub 2) space.

SPATIALLY RESOLVED SPECTROSCOPY OF AG CARINAE, AND DIRECT EVIDENCE FOR STELLAR EVOLUTION: THE CENTRAL STAR OF NGC 2392 Final Report, 8 Jun. 1992 - 7 Jun. 1993
Bruce Altner and Steven N. Shore 9 Jun. 1993 9 p
(Contract NAS5-31838)

(NASA-CR-189291; NAS 1.26:189291; ARC-R93-207) Avail: CASI HC A02/MF A01

We have performed spatially-resolved low dispersion long-slit spectroscopy for the circumstellar shell of the luminous blue variable AG Carinae with IUE between lambda lambda 1200 - 3200 A. At all positions a strong dust-scattered stellar continuum is detected. Only a few emission lines, FE II 2600 and O I (?) 1304, have been detected; the emission is stronger on the southern side of the shell. The UV surface brightness and derived dust properties are completely consistent with the groundbased and KAO FIR observations: the grains are large (0.1 - 1 micron), warm (45 - 100 K depending on composition), highly reflecting (C(sub sca)/C(sub abs) approximately equal to 1), and tie up about 10(exp -4) to 10(exp -3) solar mass of material. We also observe similarities of the results for HR Car and LBV's to those reported here. Author

COSMOGENIC C-14 IN ANTARCTIC AND NON-ANTARCTIC METEORITES AND LUNAR SAMPLES Final Technical Report, 1 Jun. 1987 - 31 May 1994
A. J. Timothy Jull, D. J. Donahue, and G. S. Burr 1994 4 p
(Grant NAG9-233)
(NASA-CR-195795; NAS 1.26:195795) Avail: CASI HC A01/MF A01

We were able to develop measurements of C-14 in meteorites as a useful tool for estimates of terrestrial age. Prior to this accomplishment, only a few measurements of C-14 terrestrial ages had been made. The sample sizes were larger, and there had been no systematic study of the various parameters affecting production of C-14, such as depth dependence, and the production cross sections for C-14 from spallation amounted to a few data points. Presently, C-14 ages are an accepted terrestrial age estimate in the meteorite community, whereas before this work the few data available were difficult to interpret. We have obtained terrestrial ages not only on groups of meteorites from different geographic areas but also information on unique meteorites from particularly interesting groups, such as meteorites originating from the Moon, or SNC meteorites, which many researchers believe are derived from Mars. ON DYONIC BLACK HOLES AND COSMIC CENSORSHIP Ph.D. Thesis
Ibrahim Semiz 1992 63 p
Avail: Univ. Microfilms Order No. DA9315258

In this thesis, we construct two thought experiments to test the Cosmic Censorship Conjecture attempting to overcharge and/or overspin a critical four-parameter (the usual three of mass, electric charge, and angular momentum plus magnetic charge) black hole. The first is a generalization of a previous thought experiment where Wald tried to give the critical black hole extra charge and/or angular momentum by letting it swallow particles. We generalize this thought experiment to cover the possibility of magnetic charge, both on the particle and the black hole. The second is a new thought experiment where we feed charge and/or angular momentum to the black hole via a Klein-Gordon field. In both cases, we find that the Cosmic Censorship Conjecture cannot be violated. To be able to do the calculations for the second thought experiment, we separate the Klein-Gordon Equation on this black hole metric. We also separate the Dirac Equation and investigate the effects of the black hole's magnetic charge on the ergosphere and on superradiance. Dissert. Abstr.

N94-29913 Yale Univ., New Haven, CT.
CONVECTIVE TURBULENCE AND TRANSPORT IN STARS Ph.D. Thesis
Miguel Perez-Saborid 1992 161 p
Avail: Univ. Microfilms Order No. DA9315230

This work treats the convection zone of a slowly rotating, weakly magnetic star. It assumes that the turbulence is weak, short scale-length, and sound-wave-like in character, that the mean pressure and density in the convection zone are linked by the condition of marginal stability against convection, and that the statistics of the turbulence is axisymmetric about the axis of rotation. In these circumstances one obtains limited information about the turbulence, namely the average radial velocity and the turbulent mass flux, in terms of quantities determined by standard, spherically symmetric, stellar evolution calculations independently of any assumptions about the character of the turbulence. The theory is illustrated numerically for the sun. It is demonstrated that under the assumptions made, the average acoustic energy flux is to the lowest order equal to the average turbulent energy flux determined by conventional stellar evolution. With the purpose of using this result to predict features of the statistics of the oscillations which can be compared with existing solar observations, the average acoustic energy flux is expressed in terms of the spatial eigenfunctions associated with the acoustic modes. After an approximate analysis, which assumes that the oscillations are excited by a broadband random source (white noise) and damped according to a linear damping mechanism, one obtains an expression for the acoustic energy flux that contains partial information about the statistics of the mode amplitudes. Dissert. Abstr.

NEAR-CRITICAL SPHERICALLY SYMMETRIC ACCRETION BY NEUTRON STARS Ph.D. Thesis
Brand Irving Fortner 1993 145 p
Avail: Univ. Microfilms Order No. DA9314869

The luminous, low-mass x ray binary systems are thought to contain neutron stars with luminosities comparable to the Eddington critical luminosity L(sub E) at which the outward force of radiation balances gravity. A subset of these systems, called Z sources, show three distinct spectral states and quasiperiodic intensity oscillations. In a recently proposed unified model of this behavior, mass accretes not only through a disk but also approximately radially from the inner disk. This thesis reports the results of an investigation of the structure and stability of the radial flow when the luminosity of the star is near-critical. It is shown that when the luminosity of the star is comparable to L(sub E), radiation drag creates a significant, approximately radial inflow from the inner disk corona to the star. A simplified model of this flow and the time-dependent radiation hydrocode used to simulate it are described. As expected, the simulated flow has an outer region where the inflow velocity increases with decreasing radius, a middle region where the velocity is roughly constant, and an inner region where the velocity decreases toward the star. The simulations show that the radial flow becomes over-stable (that is, the flow oscillates with increasing amplitude) when the luminosity rises to within a few percent of L(sub E). If the radial inflow begins approximately 300 km from the neutron star (as expected), the frequency of the oscillations is approximately 5 to 10 Hz, comparable to the frequency of one class of quasiperiodic oscillations observed in the Z sources. The variation in optical depth is substantial, whereas the variation in luminosity is relatively small. Calculations of the amplitudes and phases of the resulting oscillations in the x ray intensity agree with the observed properties of this class of quasiperiodic oscillations. Dissert. Abstr.

CORRELATION ANALYSIS ON OPTICAL AND RADIO LIGHT CURVES FOR A LARGE SAMPLE OF ACTIVE GALACTIC NUCLEI Ph.D. Thesis
Sandra Denise Clements 1992 220 p
Avail: Univ. Microfilms Order No. DA9314209

Long-term optical and radio light curves for a large sample of active galactic nuclei were investigated in order to examine the relationship between the two emission regions. Correlation analysis using the discrete correlation function was performed to determine if radio events are correlated with optical events, and, if so, to determine the lag times between them. In addition, similar analysis was performed to determine lag times between events at 14.5 GHz, 8.0 GHz, and 4.8 GHz. A total of forty-six objects were examined. Nine showed correlated optical and radio events with optical leading the radio in every case. Six of these were BL Lacertids, all having lag times of less than 6 months. The one QSO which showed correlated optical and radio events had a longer lag time, on the order of a year. No difference between BL Lacs and QSO's is seen in the results of correlation analysis on two radio frequencies. Lag times between 14.5 GHz and 8.0 GHz radio data are less than 5 months in almost every case. The same is true for lag times between 8.0 GHz and 4.8 GHz data. An additional nine objects showed no correlated behavior in their optical and radio light curves. Seven of these objects were QSO's. The rest of the objects either did not have light curves with adequate temporal coverage for reliable correlation analysis, or the analysis was confused by the number and spacing of events in one or both light curves. This analysis was seriously hampered by inadequate temporal coverage in the optical light curves. Some variability timescales in the optical are very short, making frequent observations necessary in order to resolve events. Unavoidable constraints on ground-based observations due to the weather, the sun,

and the moon make it impossible to obtain the frequent, uninterrupted observations that are necessary to obtain a light curve without yearly gaps and with well-resolved short-term events. Dissert. Abstr.

THE EFFECTS OF RELATIVISTIC NEUTRONS ON NONTHERMAL MODELS OF ACTIVE GALACTIC NUCLEI Ph.D. Thesis
Peter Michael Giovanoni 1992 176 p
Avail: Univ. Microfilms Order No. DA9315644

Active galactic nuclei produce large amounts of radiation from relatively small regions. How this energy is generated is one of the main topics of research on active galaxies. This work emphasizes the effects of relativistic neutrons on the observed spectrum and on the variability properties of active galactic nuclei. The energy emitted as radiation is initially injected into the system as relativistic protons from a static shock front. The shape of the energy distribution function of the protons is assumed to be a power law form. Through inelastic hadronic collisions the energy in the protons is put into neutrinos, positrons, electrons, and neutrons. The emitted radiation from roughly the near infrared to gamma rays of a few MeV energy is due to emission in the core near the shock front. The neutrons that are sufficiently energetic escape the core and, when they decay, they transfer their energy to charged particles in outer regions that are orders of magnitude larger in size than the core. In this thesis the effects of this energy transport on steady-state and time-dependent active nuclei are studied. When matter falls into the core at roughly the Eddington mass accretion rate the neutron energy transport gives rise to radio-loud and gamma ray loud objects. Both the radio and the gamma ray photons in these objects come from the regions farthest from the central core. A small increase in the infalling medium's density prevents the neutrons from reaching these distances and such models yield radio and gamma ray quiet objects; that is, one sees only the radiation from the core. When the luminosity varies with time, one may expect the radiation from the core to vary on a shorter timescale than radiation from the outer regions. The main parameters in the model are varied in order to determine the relative importance of synchrotron, inverse Compton, and photon-photon interactions. In the time-dependent model, the response of the system to three types of pulses in the proton injection rate were studied. The three forms were a delta function, a step function, and a top-hat function. Two timescales control the observable changes in the radiation, the proton collision timescale and the light travel time to the radiating region for each frequency. The response was mostly as expected from the steady-state model. The proton collision timescale tends to be the dominant timescale. There was both rapid and longer term variability in the gamma ray emission, with the short term variability being strongest in the lower gamma ray frequencies. The radio variations were usually very weak in the models. Dissert. Abstr.

THE ANGULAR TWO-POINT CORRELATION FUNCTION OF GALAXIES DOWN TO 25TH MAG Ph.D. Thesis
Lyman Wade Neuschaefer 1992 226 p
Avail: Univ. Microfilms Order No. DA9307122

This dissertation examines the evolution of galaxy clustering from deep CCD exposures. The deep images obtained for this work are from two widely separated (b(sup II) approximately greater than 30 degrees) fields imaged in Gunn gri pass bands, both approximately equal to 0.5 degree in extent. More than 90 percent of the galaxies brighter than g approximately equal to 24.5 mag are detected, with more than 23,000 galaxies found in each field, in each passband. The precision of the zero-points is approximately less than 0.1 mag for all frames and the overall precision of the CCD astrometric solutions is approximately less than 0.5(sup II). Galaxy angular two-point correlation functions are measured and interpreted in terms of sample completeness, evolution in galaxy spectra, evolution in clustering, and the overall matter density in the universe. The observed galaxies undergo a moderate bluing trend with increasing sample depth. Given the most recent measured faint galaxy redshift distributions, this suggests that a significant fraction of medium redshift galaxies (0.2 approximately less than z approximately less than 0.8) either undergo mild episodic bursts of star formation or are a new class of dwarf galaxies unobservable at the present epoch, or a combination thereof. Two trends in the correlation function, w(theta) varies as theta(sup delta), are observed as a function of increasing survey depth: The amplitude of w(theta) steadily decreases (but levels off beyond the 90 percent completeness limit), and is lower at a given apparent magnitude than expected for a flat universe containing galaxies with nonevolving spectra; the slope in w(theta) is observed to mildly flatten, from delta approximately equal to -0.8 locally to delta approximately equal to -0.4 at g(sub mcd) = 25 mag. These results suggest one or a combination of the following explanations: the slope, delta(z), of w(theta) grows steeper with cosmological time, consistent with galaxy clusters forming before individual galaxies; galaxy clustering evolves in amplitude, expressed by a relatively large value of the clustering exponent epsilon approximately less than 0 (epsilon = 0 (-1.2) corresponds to galaxy cluster sizes fixed in proper (comoving) coordinates); and field galaxies have undergone mild spectral evolution out to redshifts z approximately less than 1. Although the results are somewhat insensitive to space curvature, they are consistent with a flat (Omega(sub 0) = 1) universe, with mild evolution in galaxy spectra, correlation slope, and correlation amplitude since z is approximately less than 1. THEORETICAL ASTEROSEISMOLOGY OF WHITE DWARF STARS: THE ENCYCLOPEDIA SEISMOLOGICA Ph.D. Thesis
Paul Andrew Bradley 1993 312 p
Avail: Univ. Microfilms Order No. DA9323347

White dwarfs represent the most common fate suffered by stars as they exhaust their supply of nuclear fuel and cool to oblivion. According to conventional wisdom, these objects have degenerate carbon/oxygen cores overlain by a pure helium mantle (DB white dwarfs); in many cases, a thin veneer of hydrogen lies on the surface (DA white dwarfs). The PG1159 stars are pre-white dwarfs that hold clues to their previous evolution through the planetary nebula stage; about half of these stars pulsate. My goal is to understand the internal structure of these stars by applying the tools of asteroseismology. I present parametric grids of evolutionary pre-white dwarf, DB, and DA models and develop the theoretical tools necessary to determine the internal structure of these stars. I use the nearly continuous photometric data provided by the Whole Earth Telescope on the pre-white dwarf PG1159-035, and the DBV white dwarfs GD358 and PG1115+158 to determine their internal structure in detail. The mass of PG1159-035 is 0.59 +/- 0.01 solar mass, GD358 has a mass of 0.61 +/- 0.03 solar mass, and the mass of PG1115+158 is 0.62 +/- 0.06 solar mass; all three masses are similar to the mean masses of white dwarfs in general. The He/C/O surface layer mass of PG1159-035 is 3.9 x 10(exp -3)M*, which can be duplicated by stellar evolution models, although they cannot duplicate the observed surface abundance, suggesting that our knowledge of mass loss is incomplete. The helium layer mass of GD358 is 1.5 x 10(exp -6)M*, and is less than 10(exp -4)M(sub *) for PG1115+158. These helium layers are vastly thinner than suggested by stellar evolution theory and present problems for current evolutionary models of DB white dwarfs. If these helium layer masses are correct, then we must revise our thinking on how convective dredge up works in the presence of diffusion. I also present preliminary assessments of the structure of several pulsating DA white dwarf (DAV) stars. In spite of the relatively small number of observable modes in the DAV white dwarfs, several of them appear to have thick hydrogen layer masses (approx. 10(exp -(5-6))M(sub *)), based on existing stellar mass estimates and assumptions about the identity of the observed modes. Finally, I describe how my structure determinations and recent spectroscopic observations may help to clarify our picture of white dwarf evolution. Dissert. Abstr.

ENERGETIC EVENTS IN THE EARLY UNIVERSE Ph.D. Thesis
Biman Bihari Nath 1992 117 p
Avail: Univ. Microfilms Order No. DA9315706

Various forms of energy inputs at high redshifts and their measurable effects are considered. Distortions in the microwave background radiation from various energetic phenomena are calculated. Radiation in the x ray and UV from the diffuse gas in collapsing galaxies is investigated from the point of view of their discovery with present-day detectors. In the first chapter, it is shown that, for a nontrivial radiative decay channel of the 17-keV neutrino, the photons would distort the microwave background radiation through ionization of the universe. The constraint on the branching ratio of such decays from COBE measurements is found to be more stringent than that from SN 1987A. We then derive analytical formulae for the optical depths of a radiation-dominated universe and find that if the universe were radiation-dominated at redshifts z approximately greater than

10(exp 2) to 10(exp 3), it would be optically thin in soft gamma rays up to redshifts of z approximately 10(exp 4). This is larger by an order of magnitude than for the matter-dominated universe. In chapter 3, general similarity solutions are obtained for spherical, cooling blast waves in an Omega(sub b) much less than Omega = 1 universe, given an energy input that is some power of time. The distortion of the microwave background is calculated in terms of the present-day peculiar velocities and the present-day voids in the velocity space caused by the explosions. The predicted distortion is found to be marginally consistent with the present-day observations and could provide a test of the model in the near future. Next, the diffuse emission from galaxies during their initial collapse is considered. It is shown that large galaxies could be seen and spatially resolved in the x ray, if they form at z approximately 1 to 5, by AXAF and ROSAT. UV cameras could discover such objects if much of their radiation emerges in the He(+) Lyman alpha. An estimate is made for the sensitivity of the x ray luminosity to the baryon mass while the baryons are still diffuse. The possibility of using the x ray observations as a diagnostic for the dominant mass component in the protogalaxy is discussed. Finally, the possibility of detecting protogalaxies in UV band is pointed out, assuming galaxy formation occurred at z approximately 5. It is shown that the diffuse gas in collapsing galaxy sized objects with temperatures approximately 10(exp 6 +/- 0.5) K, and with a modest amount of metallicity, should copiously produce emission lines from highly ionized iron atoms. The predicted luminosities from different models of galaxy formation are compared with the sensitivity of HST.

INHOMOGENEITIES IN THE WIND FROM WOLF-RAYET STARS Ph.D. Thesis [INHOMOGENEITES DANS LE VENT DES ETOILES WOLF-RAYET]
Carmelle Robert Dec. 1991 396 p In FRENCH
(ISBN-0-315-85893-1; CTN-94-61132) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Spectroscopic measurements on nine Wolf-Rayet stars have shown the existence of perturbated regions of motion in their stellar winds. The presence of the perturbations is signalled by numerous small variable structures superposed on the profile of the emission lines formed in the stellar wind. A study of the global variations of the lines and an examination of individual microstructures have allowed description of various characteristics of the perturbations. Among others, significant correlations are observed between the level of variability of the lines and certain stellar parameters which confirm that the phenomenon of variability is intrinsic to the stellar wind. It is also concluded that the perturbated regions have a finite extent with respect to the stellar envelope. It is proposed to represent the perturbations by a model of discrete inhomogeneities in expansion within the wind. A correlation is obtained between the number of detected inhomogeneities and the terminal velocity. It is estimated that the loss in mass due to detectable inhomogeneities corresponds to 10 percent of the mass loss of the whole wind. The structures observed in the Wolf-Rayet spectra have very similar characteristics to those of O type stars, and it is thus proposed that the perturbations observed in those two types of stars have the same origin.

A THEORY APPROACH FOR CREATION OF THE MATTER OF UNIVERSE
Duong Van Phi and Duong Anh Duc Aug. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-608109; IC-93/284) Avail: CASI HC A03 (US Sales Only)

We shall represent an approach for the creation of the matter of Universe in the framework of a quantum theory, established in an 8-dimensional space. The primitive matter was being created from the Primary Vacuum and it consisted of the deuterons atoms, neutrinos and photons. From these neutral elements the attractive centers were formed and in the final stage an extremely high mass density Universe was built, and successively, the Big-Bang occurred. The problems of particle dominance, of excess of the deuterons and of magnitude of the numbers of neutrinos, etc. are discussed.

A NUMERICAL STUDY OF GRAVITATIONAL COLLAPSE Ph.D. Thesis
Shang-Wen Sun 1993 176 p
Avail: Univ. Microfilms Order No. DA9328529

The Einstein equations coupled with the scalar wave equation are studied as an initial value problem within the restriction of spherical symmetry. A spherical shell of the scalar field sandwiched between the flat and the Schwarzschild geometry is evolved using various numerical techniques. Two drastically distinct fates can be met for this initial scalar field depending on a certain criterion. In one case, the scalar field eventually dispersed to infinity; in the other case, the scalar field collapses to form a black hole. In most coordinate systems, the motion of the scalar field inside event horizon appears to freeze when a black hole starts to form. A special coordinate system is chosen to study the dynamical evolution inside the event horizon and the criterion that determines the fate of a given initial scalar field.

STELLAR AND GAS DYNAMICS OF INTERACTING RING GALAXIES Ph.D. Thesis
Richard Alan Gerber 1993 217 p
Avail: Univ. Microfilms Order No. DA9329038

The development of ring and arc structures due to the collision of a spherical galaxy normal to the plane of a disk galaxy is studied with analytic and numerical models. In the numerical model, the disk contains one-tenth of its mass in gas and the hydrodynamics equations are solved using the method of Smoothed Particle Hydrodynamics. It is found that axisymmetric collisions between equal mass galaxies produce a strong expanding ring with a complex three-dimensional structure. Density and velocity profiles for the disk are given. Off-center collisions produce greater gas density enhancements in the nonnuclear portion of the disk when compared to the axisymmetric case. Strong gas interactions in the off-center collisions cause the stellar and gaseous flows to follow separate trajectories. If star formation is associated with the strongest gas shocks and greatest gas densities, the morphology of ring galaxies is strongly dependent on a proper treatment of gas dynamical processes. A Rayleigh-Taylor instability is believed to be present in the strong shock regions, which could contribute to the knotty structure observed in ring galaxies.

THE SECOND COMING OF COLD DARK MATTER?
W. H. Zurek, M. S. Warren, P. J. Quinn, and J. K. Salmon 1993 11 p Presented at the Cosmic Velocity Fields Conference, Paris, France, Nov. 1993
(Contract W-7405-eng-36)
(DE94-004992; LA-UR-93-4240; CONF-9311156-1) Avail: CASI HC A03/MF A01

In recent years standard cold dark matter (CDM) theory, which enjoyed a large following throughout much of the past decade, has been abandoned by virtually all of its early supporters. The most serious argument against CDM was the incompatibility between the relatively high value of the pairwise radial velocity dispersion between galaxies, sigma(sub v), inferred from numerical simulation with the much lower observational estimates. We reexamine this argument in the light of our new, high-resolution, COBE-normalized simulations and conclude that sigma(sub v) is significantly overestimated in simulations which do not have sufficient resolution (i.e., which have masses of galaxies comparable to the mass of N-body particles) and that it is also difficult to reliably estimate sigma(sub v) from the observational catalogues used for this purpose. We conclude that inflationary cosmology and CDM are not -- contrary to the presently prevailing prejudice -- incompatible with the observations of small scale peculiar velocities, as characterized, for example, by sigma(sub v).

SUBSTRUCTURE, DYNAMICS AND EVOLUTION IN CLUSTERS OF GALAXIES Ph.D. Thesis
Christina Marie Bird 1993 240 p
Avail: Univ. Microfilms Order No. DA9328326

Most models for the formation of large scale structure imply that clusters of galaxies are currently forming. Because the Hubble time is on the order of a few dynamical timescales for clusters, there is some hope that their structure will retain signatures of their formation and initial

conditions. In order to objectively identify the different sorts of substructure which may exist in clusters of galaxies at the present time, I present a variety of statistical diagnostics which measure deviations of cluster galaxy velocities and positions from those expected in a relaxed system. These tests are applied to a database of rich clusters with at least 50 measured redshifts, depending on the diagnostic considered. 30-70 percent of all well-studied clusters possess significant substructure. Only one system in the cluster database, A496, does not have any significant deviations from the structure expected for a relaxed, dynamically-evolved cluster. Once the importance of substructure in any particular cluster has been assessed, a maximum likelihood technique is used to assign individual galaxies to their host subclusters. These statistical techniques are applied to the study of central galaxy peculiar velocities. Formation models for central dominant galaxies require them to be preferentially located at the bottom of their cluster potential well. Without correcting for substructure, 50 percent of the cD-type systems in the cluster database have central galaxies which are displaced from their potential minimum (as defined by the cluster average velocity). These systems are much more likely to exhibit correlations between galaxy velocities and positions than clusters in which the central galaxy is at rest, providing evidence that substructure may be responsible for the high velocity offsets. If dynamical models which include subcluster assignments are used to determine the peculiar velocities, only 20 percent of the cD-type clusters have significant velocity offsets. Dissert. Abstr.

MUADEE: MARS UPPER ATMOSPHERE DYNAMICS, ENERGETICS, AND EVOLUTION DISCOVERY MISSION. EXECUTIVE SUMMARY VOLUME Final Report

Timothy L. Killeen 15 Mar. 1994 100 p
(Grant NAG5-2250)
(NASA-CR-195732; NAS 1.26:195732) Avail: CASI HC A05/MF A02

This document is the final report of the MAUDEE (Mars Upper Atmosphere Dynamics, Energetics, and Evolution) consortium. It describes a low cost Discovery mission to investigate the upper atmosphere of Mars and to understand the manner in which Mars has evolved over geologic time. In keeping with the innovative philosophy permeating the Discovery Program and in order to minimize the burden of reading an extensive prose exposition, a new presentation format has been adopted. The format involves a series of view graphs with facing text. The view graphs form the basis of a complete oral presentation of the MAUDEE mission and the facing text provides more detailed, but still brief, explanatory descriptions. Readers can scan the view graphs and/or read the facing text at their discretion. The oral presentation of this study was given to code SL personnel at NASA Headquarters on February 23, 1994. MAUDEE is an essential component of the Mars Exploration Program. It provides the information required to understand the evolution of the planet via the escape of volatiles. It provides the key measurements needed to understand the upper atmosphere of the last of the three terrestrial planets to be so studied. It connects and supplements investigations based on other Mars missions: Mars Surveyor, Planet-B and Mars-96. The MAUDEE mission plan involves a combination of remote and in-situ sensors, housed in three instrument packages. The sensors make measurements of the atmospheric regions between 60-200 km. These instruments are based on extensive heritage from Earth explorers and Pioneer Venus. The mission scenario has several phases and employs aerobraking maneuvers to lower initial apoapsis, thereby reducing fuel requirements. The spacecraft has body-mounted solar cells, enabling deep diving into the Martian atmosphere. The orbital inclination allows for pole-to-pole latitudinal sweeps in an initial elliptical phase, followed by a circular phase affording detailed diurnal measurements. The nominal mission duration at Mars is one Mars year. Derived from text

PREDISSOCIATION IN N2(C'4, 1 SIGMA u +) AND OTHER N2 STATES AND ITS IMPORTANCE IN THE ATMOSPHERES OF TITAN AND TRITON Annual Report

Tom G. Slanger and Richard A. Copeland Apr. 1994 6 p
(Grant NAGw-3581; SRI Proj. 4725)
(NASA-CR-195727; NAS 1.26:195727) Avail: CASI HC A02/MF A01

The objectives of this program are to further the understanding of the upper atmospheres of Titan, Triton, and the Earth in terms of the observed emissions of the 13-14 eV states of N2. These states are generated at quite high rates, yet very little emission is observed from them. The reasons are complex, involving resonance trapping and predissociation, and it is desired to quantify the effects of predissociation, particularly on the c(sub 4)' 1 Sigma(sub u),(sup +) state of N2. Earlier experiments had indicated that predissociation of the c(sub 4)' state was of little importance, yet over the last two years a growing body of evidence has shown that for levels above v = 2, predissociation is in fact a major process. It is the v = 0 level for which production by electron bombardment and photoexcitation is highest, and so it has been most important to evaluate the effects of predissociation on this particular level. The goal has been to target c(sub 4)' (v = 0) for a thorough analysis, in which both the extent of predissociation as a function of rotational level and the atomic product branching ratio, where the only possible products are N(4S) + N(4S) and N(2D) + N(4S), are determined. For the first year of funding, the intention was to demonstrate two-photon excitation of the intermediate N2(a(sup 1) Pi(sub g)) state, so that the gap to the 13 eV energy region could be bridged, and then use a second laser to reach the c(sub 4)' state itself. VENUS DATA ANALYSIS PROGRAM: DIRECTORY OF RESEARCH PROJECTS (1993-1994)

11 Apr. 1994 99 p
(Contract NASw-4574)
(NASA-CR-195742; NAS 1.26:195742; LPI-TR-94-01) Avail: CASI HC A05/MF A02

This directory provides information about the scientific investigations funded by the NASA Venus Data Analysis Program (VDAP) during fiscal year 1993. The VDAP Directory consists of summary sheets from the proposals that were selected by NASA for funding in FY 93. Each summary sheet indicates the title, principal investigator, institution of the investigation, and information related to the objectives of the research activities proposed for FY 93. The objective of the VDAP Program is to advance our understanding of the nature and evolution of Venus. VDAP supports scientific investigation using data obtained from the Magellan, Pioneer Venus, and other Venus missions, as well as earth-based observations that contribute to understanding the physical and evolutionary properties of Venus. The program intends to enhance the scientific return from these missions by broadening the participation in the analysis of Venus data. Categories of research funded by VDAP are atmosphere, ionosphere, geology, geophysics, and mapping. The directory is intended to provide the science community with an overview of the research projects supported by this program. Research activities identified in this directory were selected for funding in FY 93 on the basis of scientific peer review conducted by the VDAP Review Panel. Derived from text

ANALYSIS OF CRUSTAL STRUCTURE OF VENUS UTILIZING RESIDUAL LINE-OF-SIGHT (LOS) GRAVITY ACCELERATION AND SURFACE TOPOGRAPHY DATA. A TRIAL OF GLOBAL MODELING OF VENUS GRAVITY FIELD USING HARMONIC SPLINE METHOD Final Technical Report

Ming Fang and Carl Bowin 1992 9 p

(Grant NAG2-768)
(NASA-CR-195799; NAS 1.26:195799) Avail: CASI HC A02/MF A01

To construct Venus' gravity disturbance field (or gravity anomaly) with the spacecraft-observer line of site (LOS) acceleration perturbation data, both a global and a local approach can be used. The global approach, e.g., spherical harmonic coefficients, and the local approach, e.g., the integral operator method, based on geodetic techniques are generally not the same, so that they must be used separately for mapping long wavelength features and short wavelength features. Harmonic spline, as an interpolation and extrapolation technique, is intrinsically flexible to both global and local mapping of a potential field. Theoretically, it preserves the information of the potential field up to the bound by sampling theorem regardless of whether it is global or local mapping, and is never bothered with truncation errors. The improvement of harmonic spline methodology for global mapping is reported. New basis functions, a singular value decomposition (SVD) based modification to Parker & Shure's numerical procedure, and preliminary results are presented. Derived from text

CORRELATION STUDIES OF PIONEER VENUS IMAGERY OBTAINED FROM PV EXPERIMENTS WITH NEAR IR IMAGERY OBTAINED FROM GROUND-BASED OBSERVATIONS DURING VENUS INFERIOR CONJUNCTION Final Report
Boris Ragent Oct. 1993 55 p
(Grant NAG2-681)
(NASA-CR-195772; NAS 1.26:195772) Avail: CASI HC A04/MF A01

The purpose of this study is to attempt to find correlations between data taken by experiments aboard the Pioneer-Venus Orbiter (PVO) and those obtained from Earth-based near-infrared (NIR) measurements of Venus during periods near inferior conjunction. Since the NIR measurements have been found to provide data on the middle atmosphere cloud morphology and motion, it is assumed that any correlations will also indicate that the PVO experiments are also documenting cloud behavior. If such correlations are found, then a further task is to attempt to study the long term behavior of the cloud features implied by the correlations. Many PVO data have been obtained over an extended period extending from 1978 until the PV demise in 1992. There exists a long, somewhat ill-conditioned time series of data that may contain valuable information on the long time, as well as short term behavior of the clouds, and, derivatively from cloud motion, atmospheric dynamics and wave activity in the Venus atmosphere. For example, determination of the zonal velocities of any OCPP (Cloud Photopolarimeter) 0.935 micron features could then be used for comparisons with data from other sources to attempt to fix the altitude region in which such features existed. A further task of this study is to attempt to correlate any features found in simultaneously obtained data, for example, the OCPP 0.365 and 0.935 micron data. The existence of such correlations may imply that data was obtained in overlapping altitude regions of the atmosphere. Derived from text

OBSERVATION OF JOVIAN AURORAL LY-ALPHA LINE PROFILE AND EMISSION VARIABILITY WITH A SOUNDING ROCKET AND THE IUE ARCHIVES Ph.D. Thesis
Walter Michael Harris 1993 229 p
Avail: Univ. Microfilms Order No. DA9319535

The Jovian auroral system provides an excellent laboratory for the study of the interaction of a planetary atmosphere and magnetosphere. The plasma population in the Jovian magnetosphere is dominated by an internal source (Io) and the dynamics of this plasma are controlled by its corotation with the Jovian magnetic field. Observations of the Jovian aurora indicate an energy budget two to three orders of magnitude greater than the earth. These characteristics, combined with the decrease in solar flux and solar wind at 5 AU, make this internally driven auroral system a valuable model from which to expand our understanding of the more complex terrestrial aurora. This research focuses on determining the characteristics of auroral H Ly-alpha emission. Ly-alpha is a powerful diagnostic of the Jovian aurora because it is the only far ultraviolet (FUV) emission feature which may be observed for both line profile information and integrated intensity, and because FUV emission probes the altitudes of greatest auroral energy deposition. The research presented here was approached from two directions. First, a high resolution spectrograph has been constructed to study the Ly-alpha line profile for information regarding the dynamical properties of the auroral atmosphere, the identity of the auroral progenitor particles, and the type and altitude distribution of the contributing emission processes. In the second phase of this research, the archive of IUE auroral spectra is examined for the integrated intensity of auroral Ly-alpha, particularly as it relates to variability in solar Ly-alpha, as well as the altitude, longitude distribution, and variability of auroral H2 band emission. The result of this study indicates no evidence of a link between auroral and solar Ly-alpha. However, a link is established in both the longitude distribution and the optical depth to hydrocarbon absorption of Ly-alpha and H2 emission. The detection of hydrocarbon attenuation in the Ly-alpha emission implies a complex radiative transfer solution in which the effects of resonant scattering must be included. This study concludes with a preliminary examination of these effects on both the intensity of the emission and the shape of the observed line profile. Dissert. Abstr.

REMOTE SENSING OF INNER HELIOSPHERIC PLASMAS Final Technical Report, 15 Nov. 1990 - 14 Nov. 1993

Bernard V. Jackson 14 Nov. 1993 24 p
(Grant AF-AFOSR-0091-91)
(AD-A275021; AFOSR-94-0004TR) Avail: CASI HC A03/MF A01

Solar disturbances produce major effects on the corona, the solar wind, the interplanetary medium, and the earth along with its magnetosphere. We have developed new techniques for studying plasma disturbances in the inner heliosphere by remotely sensing them. These techniques use data from the HELIOS spacecraft zodiacal light photometers and in situ data, the ISEE-3 spacecraft in situ and kilometer radio wave experiments, and a variety of other spacecraft and ground-based instruments. We use interplanetary scintillation (IPS) data from the Cambridge, England, radio telescope. The zodiacal-light photometers on board the two HELIOS spacecraft (data coverage from 1974 to 1986) provide the first reliable information about the heliospheric masses and shapes of propagating disturbances. THE APPEARANCE OF THE SUN AND MOON SEEN THROUGH CLOUDS M.S. Thesis
Jeffrey R. Linskens Dec. 1993 66 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A275338; AFIT/CI/CIA-93-147) Avail: CASI HC A04

The sun occasionally appears fuzzy through altostratus because altostratus is composed of larger particles than other clouds, and is of the necessary optical thickness. Experimental results indicate that the range of optical thicknesses of a cloud at which a fuzzy sun is seen increases with the size of the particles. This relationship is caused by an increase in the attenuation of contrast at high spatial frequencies relative to that at low spatial frequencies when the size of cloud particles increases. The increase in the size of cloud particles is caused by the presence of raindrops and crystals in the cloud. DTIC

CORRELATIVE ANALYSIS OF HARD AND SOFT X RAY OBSERVATIONS OF SOLAR FLARES Final Report
Dominic M. Zarro 21 Jan. 1994 9 p
(Contract NAS5-32064)
(NASA-CR-189329; NAS 1.26:189329) Avail: CASI HC A02/MF A01

We have developed a promising new technique for jointly analyzing BATSE hard X-ray observations of solar flares with simultaneous soft X-ray observations. The technique is based upon a model in which electric currents and associated electric fields are responsible for the respective heating and particle acceleration that occur in solar flares. A useful by-product of this technique is the strength and evolution of the coronal electric field. The latter permits one to derive important flare parameters such as the current density, the number of current filaments composing the loop, and ultimately the hard X-ray spectrum produced by the runaway electrons. We are continuing to explore the technique by applying it to additional flares for which we have joint BATSE/Yohkoh observations. A central assumption of our analysis is the constant of proportionality alpha relating the hard X-ray flux above 50 keV and the rate of electron acceleration. For a thick-target model of hard X-ray production, it can be shown that cv is in fact related to the spectral index and low-energy cutoff of precipitating electrons. The next step in our analysis is to place observational constraints on the latter parameters using the joint BATSE/Yohkoh data. Derived from text

CORONAL ABUNDANCES AND THEIR VARIATION Semiannual Report
Julia L. R. Saba 15 Apr. 1994 20 p
(Contract NASw-4814)
(NASA-CR-195767; NAS 1.26:195767) Avail: CASI HC A03/MF A01

This contract supports the investigation of elemental abundances in the solar corona, principally through analysis of high-resolution soft x-ray spectra from the Flat Crystal Spectrometer (FCS) on the Solar Maximum Mission. The goals of the study are a characterization of the mean values of relative abundances of elements accessible in the FCS data, and information on the extent and circumstances of their variability. This report is a summation of the data analysis and reporting activities which occurred during the first ten months of the contract, 15 Jun. 1993 to 15 Apr. 1994. Author (revised)

A radiochemical Ga-71-Ge-71 experiment to determine the primary flux of neutrinos from the Sun began measurements of the solar neutrino flux at the Baksan Neutrino Observatory in 1990. The number of Ge-71 atoms extracted from initially 30 and later 57 tons of metallic gallium was measured in fifteen runs during the period of Jan. 1990 to May 1992. The observed capture rate is 70 +/- 19 (stat) +/- 10 (syst) SNU. This is to be compared with 132 SNU predicted by the Standard Solar Model. DOE

SOLAR NEUTRINO EXPERIMENTS: AN UPDATE
R. L. Hahn 1993 23 p Presented at the 14th International Workshop on Weak Interactions and Neutrinos, Seoul, Republic of Korea, 19-24 Jul. 1993
(Contract DE-AC02-76CH-00016)
(DE94-006061; BNL-49971; CONF-9307114-2) Avail: CASI HC A03/MF A01

The situation in solar neutrino physics has changed drastically in the past few years, so that now there are four neutrino experiments in operation, using different methods to look at different regions of the solar neutrino energy spectrum. These experiments are the radiochemical Cl-37 Homestake detector, the realtime Kamiokande detector, and the different forms of radiochemical Ga-71 detectors used in the GALLEX and SAGE projects. It is noteworthy that all of these experiments report a deficit of observed neutrinos relative to the predictions of standard solar models (although in the case of the gallium detectors, the statistical errors are still relatively large). This paper reviews the basic principles of operation of these neutrino detectors, reports their latest results, and discusses some theoretical interpretations. The progress of three real-time neutrino detectors that are currently under construction, SuperKamiok, SNO, and Borexino, is also discussed. DOE

[SOLAR MEASUREMENTS FROM THE AIRGLOW-SOLAR SPECTROMETER INSTRUMENT (ASSI) ON THE SAN MARCO 5 SATELLITE] Final Report
Thomas N. Woods 26 Apr. 1994 39 p Sponsored in part by NSF
(NASA Order S-97242-E)
(NASA-CR-193815; NAS 1.26:193815) Avail: CASI HC A03/MF A01

The analysis of the solar spectral irradiance from the Airglow-Solar Spectrometer Instrument (ASSI) on the San Marco 5 satellite is the focus for this research grant. A pre-print copy of the paper describing the calibrations of and results from the San Marco ASSI is attached to this report. The calibration of the ASSI included (1) transfer of photometric calibration from a rocket experiment and the Solar Mesosphere Explorer (SME), (2) use of the on-board radioactive calibration sources, (3) validation of the ASSI sensitivity over its field of view, and (4) determining the degradation of the spectrometers. We have determined that the absolute values for the solar irradiance needs adjustment in the current proxy models of the solar UV irradiance, and the amount of solar variability from the proxy models are in reasonable agreement with the ASSI measurements. This research grant also has supported the development of a new solar EUV irradiance proxy model. We expected that the magnetic flux is responsible for most of the heating, via Alfen waves, in the chromosphere, transition region, and corona. From examining time series of solar irradiance data and magnetic fields at different levels, we did indeed find that the chromospheric emissions correlate best with the large magnetic field levels. ACCELERATION IN ASTROPHYSICS
Stirling A. Colgate 1993 21 p Presented at the International Workshop on Acceleration and Radiation Generation in Space and Laboratory Plasmas, Kardmall, Greece, 10 Aug. - 4 Sep. 1993 Submitted for publication
(Contract W-7405-eng-36)
(DE94-004986; LA-UR-93-4262; CONF-9308206-1) Avail: CASI HC A03/MF A01

The origin of cosmic rays and applicable laboratory experiments are discussed. Some of the problems of shock acceleration for the production of cosmic rays are discussed in the context of astrophysical conditions. These are: The presumed unique explanation of the power law spectrum is shown instead to be a universal property of all lossy accelerators; the extraordinary isotropy of cosmic rays and the limited diffusion distances implied by supernova induced shock acceleration require a more frequent and space-filling source than supernovae; the near perfect adiabaticity of strong hydromagnetic turbulence necessary for reflecting the accelerated particles each doubling in energy roughly 10(exp 5) to 10(exp 6) scatterings with negligible energy loss seems most unlikely; the evidence for acceleration due to quasiparallel heliosphere shocks is weak (there is small evidence for the expected strong hydromagnetic turbulence and, instead, only a small number of particles accelerate after only a few shock traversals); and the acceleration of electrons in the same collisionless shock that accelerates ions is difficult to reconcile with the theoretical picture of strong hydromagnetic turbulence that reflects the ions. The hydromagnetic turbulence will appear adiabatic to the electrons at their much higher Larmor frequency and so the electrons should not be scattered incoherently as they must be for acceleration. Therefore the electrons must be accelerated by a different mechanism. This is unsatisfactory, because wherever electrons are accelerated, these sites, observed in radio emission, may accelerate ions more favorably. The acceleration is coherent provided the reconnection is coherent, in which case the total flux, as for example of collimated radio sources, predicts single charge accelerated energies much greater than observed. A STUDY OF THE ULTRAHIGH-ENERGY COSMIC RAY MASS COMPOSITION WITH THE MACRO AND EAS-TOP EXPERIMENTS Ph.D. Thesis
Stephane Coutu 1993 200 p
Avail: Univ. Microfilms Order No. DA9325348

Two components of cosmic-ray-induced air showers are measured simultaneously at the Gran Sasso Laboratory: the electromagnetic shower at the ground surface by the EAS-TOP extensive air shower array, and the deep-underground muons by the MACRO experiment. The two independent data sets collected during 96.3 days of simultaneous running are combined, and underground muon multiplicity distributions are obtained for anticoincident events (no surface trigger) and high-energy, coincident events. These categories correspond to ranges in primary energy from about 2 x 10(exp 3) GeV to a few times 10(exp 5) GeV, and from about 1.5 x 10(exp 5) GeV to about 10(exp 7) GeV, respectively. The experimental shower size and muon multiplicity distributions, as well as the distribution of mean muon multiplicity as a function of shower size (N-bar(sub mu) -- log(N(sub e)) relation), are compared to the ones obtained with detailed Monte Carlo calculations (with a generator based on recent hadronic accelerator data) using various trial compositions as input. This is done in an effort to discriminate between these models of primary cosmic-ray mass composition at and above the 'kneel' in the all-particle spectrum, where contradictory experimental evidence exists and where a knowledge of the composition would bear upon possible mechanisms for cosmic-ray acceleration and propagation. Detailed studies of simulated anticoincident event rates (which arise from a region of primary energy where the composition has been measured directly by satellite and balloon experiments) uncover problems with the generator used, with between 25 and 40 percent too few high-energy muons created. This, combined with the dependence of absolute event rates on the assumed differential primary energy spectra, hampers the interpretation in terms of composition of underground muon or surface air shower data taken separately. However, the N-bar(sub mu) -- log(N(sub e)) relation is independent of the spectra or overall Monte Carlo normalization problems. The simulated N-bar(sub mu) -- log(N(sub e)) relation for coincident events is found to be inconsistent with the possibility that the cosmic ray flux becomes proton-dominated at and above the knee. Dissert. Abstr.

A STUDY OF ULTRA HIGH-ENERGY RADIATION ASSOCIATED WITH HERCULES X-1 Ph.D. Thesis
Steven Douglas Biller 1992 274 p
Avail: Univ. Microfilms Order No. DA9323904

Data from the CYGNUS experiment has been used to examine ultra high energy (UHE) radiation associated with the x ray binary star system Hercules X-1. A search for both pulsed and unpulsed emission over time scales ranging from minutes to years has failed to yield a result of comparable significance to that of the previously published observation of 24 July 1986. A reassessment of this result in light of the number of hypotheses that have been examined for Hercules X-1 yields a probability estimate of 0.44 percent that the data is consistent with background fluctuations. If the number of independent source hypotheses is also accounted for, an overall chance probability of 1.8 percent is assessed for the observations of the CYGNUS experiment. The extensive air showers corresponding to the episode of 24 July 1986 contain a substantial muon content, in contradiction with traditional predictions for primary gamma rays. No satisfactory theory has yet been put forward to explain this phenomenon. A further analysis of shower characteristics for events associated with this episode indicates a steeper radial dependence of the shower-front timing width at a chance probability level of 0.16 percent. This property might be explained by a model that invokes a forward-peaked and/or a deeply interacting component of the hadronic interaction in the atmosphere. The potential importance of UHE observations of Hercules X-1 is great; however, the evidence is not yet compelling. Dissert. Abstr.

BROAD H ALPHA PROFILES OF RADIO-LOUD ACTIVE GALACTIC NUCLEI AND RAPID PROFILE VARIABILITY IN SEYFERT AND RADIO GALAXIES Ph.D. Thesis
Michael Eracleous 1992 114 p
Avail: Univ. Microfilms Order No. DA9313588

This thesis is a study of the shapes and variability of the broad H alpha emission lines of radio-loud active galactic nuclei (AGN's). We present the results of a comprehensive search for double-peaked H alpha profiles among moderate redshift radio galaxies and radio-loud quasars. We find seven new double-peaked H alpha profiles which can be fitted with a simple, relativistic, Keplerian disk model, bringing the total number of such profiles known to 11. Disk-like profiles (12 percent of all the objects we have considered) have noticeably larger full widths at half maximum. This confirms, and possibly explains, the results of previous studies which concluded that radio-loud AGN's have wider and more complex profiles than optically selected objects. In the (radio-loud) objects of our collection, the broad H alpha lines are preferentially redshifted with respect to the frame defined by the narrow lines, in contrast to optically selected samples where blueshifts and redshifts are equally common. In disk-like emitters the continuum in the vicinity of H alpha is dominated by starlight, and the low-excitation, forbidden lines are unusually strong. These trends can be understood in the context of a physical model in which the lines originate

in the outer parts of the accretion disk and are driven by illumination from the inner disk. Alternative models for the origin of double-peaked emission lines include supermassive binary black holes and biconical radial flow. We also present the results of a search for rapid variability (on time scales of hours to days) in the H alpha profiles of eight nearby Seyfert and radio galaxies. The purpose of the search was to look for specific evidence for reverberation from an accretion disk in response to flaring of the source of ionizing radiation. The results are largely negative in that they reveal no profile variability in the H alpha profiles of any of the target objects at the one percent level on time scales of a few days or less. We do, however, find long term variability in some Seyfert galaxies of a type which suggests that the broad H alpha lines may consist of several components that do not vary in concert. Dissert. Abstr.

TAXONOMY OF GAMMA RAY BURSTER DATA USING A SELF-ORGANIZING NEURAL NETWORK
C. W. Baumgart 1993 26 p Presented at the 16th SPIE Thermosense: International Conference on Thermal Sensing and Imaging and Diagnostic Applications, Orlando, FL, 4-8 Apr. 1994
(Contract DE-AC08-93NV-11265)
(DE94-006480; EGG-11265-5012; CONF-940483-3) Avail: CASI HC A03/MF A01

This paper summarizes the results of a signal taxonomy study of gamma ray burst (GRB) data acquired with sensors on-board the Pioneer-Venus Orbiter (PVO) spacecraft. GRB events produce large fluxes of gamma rays with durations of seconds to minutes and have been observed since the early 1970's. The true nature of GRB's is still unknown, and several competing theories exist. A fundamental point of contention among such theories is whether or not different types of GRB exist. If different types of GRB's are discovered in the existing PVO data base, the differences may correlate with their position or source characteristics. Hence, the goal of this project was to use artificial neural networks to perform signal taxonomy on the GRB data base to determine if unique classes or types of GRB's exist. A total of 26 signal features were identified, some of which can be associated directly with some characteristic of the GRB, such as duration, peak count rate, and gamma ray spectrum hardness. Additional features that were selected included the number of zero crossings in the wavelet transform and the fractal dimension of each signal. A self organizing neural network was used with the signal features to search for correlations among the signals contained in the database. The results of this analysis revealed an intrinsic dimensionality of 2 or 3 in the database. That is, it appears as though 2 or 3 distinct types of GRB may exist. In particular, two of the classes contain roughly 90% of the signals in the database of GRB signals we had to work with. These two classes are similar in characteristics but are still sufficiently distinct from one another to form separate categories. The third class of GRB is definitely distinct from the first two. AN ABSOLUTE MEASUREMENT OF THE COSMIC BACKGROUND RADIATION TEMPERATURE AT 1.4 GHz Ph.D. Thesis
Suzanne Therese Staggs 1993 160 p
Avail: Univ. Microfilms Order No. DA9328063

A ground-based radiometer is used to measure the absolute temperature of the cosmic background radiation (CBR) at a frequency of 1.4 GHz. The instrument comprises a corrugated horn antenna coupled to a cryogenic correlation receiver. Accurate gain calibrations are made every few minutes; the zero-level is calibrated at the beginning and the end of the observing season. Tip scans are made to measure the atmospheric emission. We find T(sub atm) = 1550 +/- 170 mK for a pencil beam measured from an elevation of 836 m. The galactic foreground emission is removed by extrapolation from a lower-frequency map. Cold loads are used to measure the instrumental emission. The ability to sample narrow (5 MHz) frequency bins across a 5 percent band pass provides a powerful tool for studying systematic effects. The systematic errors are described in detail. For the absolute temperature of the CBR, we find T(sub CBR) = 2.65 (+.33)(-.30) K. This result is in agreement with recent very accurate measurements at higher frequencies. However, the result reported here does not conflict with a low value of T(sub CBR) at 1.4 GHz which has also been reported. Dissert. Abstr.

This report reviews studies on the properties and applications of layered polysilicates. These compounds consist of silica as a major constituent and alkali ions and water molecules. The internal and external surfaces carry silanol group. From these points, layered polysilicates are different from clay minerals and are expected to provide high reactivity in the interlayer space. Particular attention is directed to the potential of these polysilicates for applications relating to their properties such as chemical composition, layered structure, thermal stability, cation exchange, dispersion of particles, gas adsorption and intercalation. An idea to prepare new materials from layered polysilicates by intercalation is also considered.

The preparation of monodispersed fine particles containing rare metals and rare earths is indispensable to the production of highly functional materials and their performance. The homogeneous nucleation and separation of nucleation stage and growth stage are essential to the preparation of the monodispersed fine particles. The homogeneous precipitation method, hydrolysis method and microemulsion method, which are probably adequate for these purposes, are mainly reviewed.

Avail: CASI HC A02/MF A02

Two kinds of diamond film were obtained by synthesizing diamond film on Mo substrates in a hydrogen plasma jet. One (type A) was random oriented cubic diamond film with clear habit planes. The other (type B) was film with no habit plane. It was inferred that the majority of type B film consisted of oriented hexagonal diamond polytypes. In order to confirm this fact, XRD (x ray diffraction) patterns of the polytypes was simulated. From the results of the simulated XRD patterns and the analysis of SAD (selected area diffraction) patterns, it can be concluded that type B film consists mainly of a mixture of many kinds of higher hexagonal diamond polytypes, and that these polytypes show a strong bracket 110 bracket orientation in the growth direction; that is, a direction vertical to the substrate surface. The flow and temperature field just above the substrate were simulated to find growth conditions for hexagonal diamond polytypes. It was found that the polytypes could be synthesized when the temperature gradient of boundary layer is greater than the gradient at which cubic diamond is synthesized. Author (NASDA)

Alloy ultrafine particles have been successfully synthesized using RF (radio frequency) thermal plasma only in cases in which all constituent elements have essentially the same physical properties such as melting point and vapor pressure. For the Sm - Co system, the difference between the vapor pressures around 2000 K is as much as the factor of 10(exp 4). Moreover, samarium has great affinity toward oxygen. Ultrafine particles of Sm - Co intermetallic compounds such as SmCo5 and Sm2Co17 thus have not been studied. For their preparation, various new techniques were applied such as quenching/sampling by water-cooled probe, holding effluent gas at high temperature by quartz tube, feeding raw materials as mist of organic solutions, and collecting ultrafine particles as colloidal suspension. The products mainly consisted of ultrafine particles of Co and monoclinic Sm2O3. When finely ground alloy powder was used as raw material, intermetallic compounds may possibly have been formed as several ten nanometer particles. The shortcomings and merits of these new techniques were also discussed. Author (NASDA)

PREPARATION OF GRAPHITE FIBERS FROM POLYIMIDE [PORIMIIDO O ZENKUTAI TO SURU KOKESSHOSEI KOKUEN SENI NO SAKUSEI] **c27**

Hiroaki Hatori, Yoshio Yamada, Minoru Shiraishi, and Yoshikazu Takahashi *In its* Journal of NIRE, Vol. 2, No. 3 25 May 1993 p 47-55 In JAPANESE (For primary document see N94-29512 08-99)

Avail: CASI HC A02/MF A02

An in-plane oriented film of Kapton-type polyimide gives a graphite film with high crystallinity after high temperature heat treatment. In-plane orientation is readily brought about when the polyamic acid film, i.e., precursor of the polyimide film, is imidized on a substrate. Through application of this feature, graphite fibers expected to have high conductivity and high strength were prepared. A polyacrylonitrile (PAN) based carbon fiber served as the fibrous substrate and was coated with a polyimide layer, in which molecules were aligned along the fiber surface, was well graphitized after heat treatment up to 2800 C, though the core fiber was nongraphitic. Polyimide coated Kevlar fibers also gave graphite fibers with high crystallinity. In this case, however, the core fibers changed from nongraphitizable to graphitizable by complexing with polyimide. An a-C:H (Amorphous Hydrogenated Carbon) film was prepared from RF (radio frequency) plasma CVD (Chemical Vapor Desposition), and the structure was investigated by means of FT (Fourier Transform)-IR (Infrared), TEM (Transmission Electron Microscope), and EELS (Electron Energy-Loss Spectrometry). The proportion among aromatic, aliphatic sp(sup 2)-, and sp(sup 3)-coordinated carbons were determined to be 1:4:10 by curve-separation technique of FT-IR absorption peaks. The diameters of the hexagonal planes and the cluster of sp(sup 3)-coordinated carbons were determined to be about 7 A with the electron diffraction pattern of the a-C:H. The low elergy-loss region of the EELS spectrum for the a-C:H was analyzed by the use of the elergy-loss function and separated into a pi plasmon peak and two plasmon peaks. These are assigned as aromatic sp(sup 2)-coordinated carbon, aliphatic sp(sup 2)-coordinated carbon, and sp(sup 3)-coordinated carbon, respectively. The ratio of electrons contributing to the peaks was calculated using the theory of the effective number of electrons. The sigma electrons associated with the peak by sp(sup 2)-coordinated carbons(sigma(sub g)) were successfully distinguished from those with sp(sup 3)-coordinated carbons(sigma(sub d)). Considering the pi electrons (pi), the relative numbers of electrons were estimated to be pi:sigma(sub g):sigma(sub d) = 1:6:4. A possible structure for the a-C:H used was exemplified on the basis of these quantitative data.

Secondarily Treated Sewage (STS) was used as the growing medium of the green micro-alga, B. (Botryococcus) braunii, which produces hydrocarbon as 50 percent of its dry weight. Algal growth in STS from domestic wastewater was good in a batch system, and hydrocarbon contents of the alga grown in two types of STS were sufficiently high at 53 and 40 percent compared with 58 percent for the Chu 13 medium. B. braunii consumed the nitrate ions in STS, thereby causing a reduction from 7.67 and 4.48 N mg/l to a level below detection (0.01 N mg/l). Phosphate ions were also consumed by B. braunii from 0.02 and 0.29 P mg/l to a level below detection (0.01 P mg/l). Using STS as the growth medium of B. braunii could facilitate the removal of nitrate and phosphate from STS by algal consumption. Author (NASDA)

INFLUENCE OF CLEARANCE AND RAKE ANGLES ON THE CUTTING FORCE OF ROCK [GANSEKI NO SESSAKU TEIKO NI OYOBOSU NIGEKAKU TO SUKUIKAKU NO EIKYO] **c46**

Tetsuji Ono, Hirokazu Karasawa, and Shigeo Misawa *In its* Journal of NIRE, Vol. 2, No. 3 25 May 1993 p 73-80 In JAPANESE (For

primary document see N94-29512 08-99)
Avail: CASI HC A02/MF A02

Fundamental rock cutting tests for several types of rock were conducted to determine the influence of clearance and rake angles on cutting force (the horizontal and vertical forces). Bits used in the tests had rake angles of -20, 0, 20 deg., and clearance angles were changed from 0 to 12.5 deg. at each rake angle. Oya tuff, Akiyoshi marble and Sanjome andesite (the uniaxial compressive strength is 110, 740, and 1100 kgf/sq cm, respectively) were cut using each bit at a cutting depth of 0.5 to 2.0 mm and cutting speed of 5m/min. The following results were obtained: (1) minimum clearance angle not affecting cutting force was between 2.5 and 5 deg. for Sanjome andesite and Akiyoshi marble, and between 0 and 1 deg. for Oya tuff; (2) rake angle affected cutting force significantly. For example, the cutting force of the bit with a -20 deg. rake angle decreased about 30 - 80 percent, compared to that of the bit with a -20 deg. rake angle; and (3) increase in cutting force with cutting depth became lower with increase in rake angle. Drag bit performance is shown to improve considerably when the rake and clearance angles are set appropriately based on rock formation conditions. Author (NASDA)

Joint research was made with the Coal Research Institute in China (CCMRI (Central Coal Mining Research Institute)) at their site. The study was conducted as a part of a program called 'Measures against ignition sources of gas and coal dust in coal mines' which focused on abnormal combustion resulting from electrical/frictional sparks and explosives. Safety of coal mine explosives was discussed. Explosion techniques, details, and related experiments were studied. Then detonation properties of explosives were reviewed, followed by experiments on exploding rate measurement and its analysis. The institute has been investigating experiments to study properties of explosions by gas/coal dust and fires in coal mines. Two basic experiments were made at a branch of the Institute: (1) detonation properties of methane-coal dust mixture; and (2) ignition properties of light alloys by frictional sparks. In the first experiment, higher coal dust concentration showed higher explosion pressure, and this was especially evident with high methane gas concentration. In the second experiment, both Japanese and Chinese aluminum alloys revealed to have quite similar ignition properties. Overall, the research produced new discoveries and information on safety and detonation properties of coal mine explosives as well as ignition properties of gas/coal dust by frictional sparks, and they are expected to serve as fundamental data for improvement in ignition sources reduction. The second Japan-U.S. Workshop on Global Change: Environmental Response Technologies was held in Hawaii on February 1-3, 1993. Over fifty leading scientists from two countries attended this workshop to examine present technology and decide on research required for the development of new technologies, for mitigation and adaptation to global change. The workshop was organized around three areas of research: (1) capture, fixation/utilization, and disposal of CO2; (2) energy production and conservation technologies to reduce CO2; and (3) adaptation technologies. Priorities for joint research in each of these areas were discussed. Author (NASDA)

This paper describes an 8-degrees-of-freedom macro-micro robot. This robot is capable of performing tasks that require accurate force control, such as polishing, finishing, grinding, deburring, and cleaning. The design of the macro-micro mechanism, the control algorithms, and the hardware/software implementation of the algorithms are described in this paper. Initial experimental results are reported. In addition, this paper includes a discussion of medical surgery and the role that force control may play.

We introduce a new class of robotic systems collectively called Robotic Enhancement Technology (RET). RET systems introduce the combination of robotic manipulation with human control to perform manipulation tasks beyond the individual capability of either human or machine. The RET class of robotic systems offers new challenges in mechanism design, control-law development, and man/machine interface design. We believe force-controllable mechanisms such as the macro-micro structure we have developed are a necessary part of RET. Work in progress in the area of RET systems and their application to minimally invasive surgery is presented, along with future research directions. Author

Current available robotic systems provide limited support for CAD-based model-driven visualization, sensing algorithm development and integration, and automated graphical planning systems. This paper describes ongoing work which provides the functionality necessary to apply advanced robotics to automated manufacturing and assembly operations. An interface has been built which incorporates 6-DOF tactile manipulation, displays for three dimensional graphical models, and automated tracking functions which depend on automated machine vision. A set of tools for single and multiple focal plane sensor image processing and understanding has been demonstrated which utilizes object recognition models. The resulting tool will enable sensing and planning from computationally simple graphical objects. A synergistic interplay between human and operator vision is created from programmable feedback received from the controller. This approach can be used as the basis for implementing enhanced safety in automated robotics manufacturing, assembly, repair and inspection tasks in both ground and space applications. Thus, an interactive capability has been developed to match the modeled environment to the real task environment for safe and predictable task execution. Author

The ATD phase of the PAWS program ended in November 1992 and the follow-on ManTech program was started in September 1993. The system will be industrially hardened during the first year of this program. Follow-on years will focus upon the transition into specific end-user sites. These implementations will also expand the system into other welding processes (e.g. FCAW, GTAW, PAW). In addition, the architecture is being developed for application to other non-welding robotic processes (e.g. inspection, surface finishing). Future development is anticipated to encompass hardening for extreme environments, expanded exception handling techniques, and application to a range of manipulators. Author

Avail: CASI HC A03/MF A04

Control of gas metal arc welding (GMAW) requires real-time sensing of the process. Three sensing techniques for GMAW are being developed at the Idaho National Engineering Laboratory (INEL). These are (1) noncontacting ultrasonic sensing using a laser/EMAT (electromagnetic acoustic transducer) to detect defects in the solidified weld on a pass-by-pass basis, (2) integrated optical sensing using a CCD camera and a laser stripe to obtain cooling rate and weld bead geometry information, and (3) monitoring fluctuations in digitized welding voltage data to detect the mode of metal droplet transfer and assure that the desired mass input is achieved. Advanced radar and communication systems rely heavily on state-of-the-art microelectronics. Systems such as the phased-array radar require many transmit/receive (T/R) modules which are made up of many millimeter wave - microwave integrated circuits (MMIC's). The heart of a MMIC chip is the Gallium Arsenide (GaAs) field-effect transistor (FET). The transistor gate length is the critical feature that determines the operating frequency of the radar system. A smaller gate length will typically result in a higher frequency. In order to make a phased array radar system economically feasible, manufacturers must be capable of producing very large quantities of small-gate-length MMIC chips at a relatively low cost per chip. This requires the processing of a large number of wafers with a large number of chips per wafer, minimum processing time, and a very high chip yield. One of the bottlenecks in the fabrication of MIMIC chips is the transistor gate definition. The definition of sub-half-micron gates for GaAs-based field-effect transistors is generally performed by direct-write electron beam lithography (EBL). Because of the throughput limitations of EBL, the gate-layer fabrication is conventionally divided into two lithographic processes where EBL is used to generate the gate fingers and optical lithography is used to generate the large-area gate pads and interconnects. As a result, two complete sequences of resist application, exposure, development, metallization and lift-off are required for the entire gate structure. We have baselined a hybrid process, referred to as EBOL (electron beam/optical lithography), in which a single application of a multi-level resist is used for both exposures. The entire gate structure, (gate fingers, interconnects and pads), is then formed with a single metallization and lift-off process. The EBOL process thus retains the advantages of the high-resolution E-beam lithography and the high throughput of optical lithography while essentially eliminating an entire lithography/metallization/lift-off process sequence. This technique has been proven to be reliable for both trapezoidal and mushroom gates and has been successfully applied to metal-semiconductor and high-electron-mobility field-effect transistor (MESFET and HEMT) wafers containing devices with gate lengths down to 0.10 micron and 75 x 75 micron gate pads. The yields and throughput of these wafers have been very high with no loss in device performance. We will discuss the entire EBOL process technology including the multilayer resist structure, exposure conditions, process sensitivities, metal edge definition, device results, comparison to the standard gate-layer process, and its suitability for manufacturing. METAFUSION: A BREAKTHROUGH IN METALLURGY **c26**
Adrian A. Joseph *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 60-63 (For primary document see N94-30440 08-99)
Avail: CASI HC A01/MF A04

The Metafuse Process is a patented development in the field of thin film coatings utilizing cold fusion which results in a true inter-dispersion of dissimilar materials along a gradual transition gradient through a boundary of several hundred atomic layers. The process is performed at ambient temperatures and pressures requiring relatively little energy and creating little or no heat. The process permits a remarkable range of material combinations and joining of materials which are normally incompatible. Initial applications include titanium carbide into and onto the copper resistance welding electrodes and tungsten carbide onto the cutting edges of tool steel blades. The process is achieved through application of an RF

signal of low power and is based on the theory of vacancy fusion. Author

NEAR-NET-SHAPE MANUFACTURING: SPRAY-FORMED METAL MATRIX COMPOSITES AND TOOLING **c24**
Kevin M. McHugh *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 64-73 (For primary document see N94-30440 08-99)
(Contract DE-AC07-76ID-01570)
Avail: CASI HC A02/MF A04

Spray forming is a materials processing technology in which a bulk liquid metal is converted to a spray of fine droplets and deposited onto a substrate or pattern to form a near-net-shape solid. The technology offers unique opportunities for simplifying materials processing without sacrificing, and oftentimes substantially improving, product quality. Spray forming can be performed with a wide range of metals and nonmetals, and offers property improvements resulting from rapid solidification (e.g. refined microstructures, extended solid solubilities and reduced segregation). Economic benefits result from process simplification and the elimination of unit operations. The Idaho National Engineering Laboratory is developing a unique spray-forming method, the Controlled Aspiration Process (CAP), to produce near-net-shape solids and coatings of metals, polymers, and composite materials. Results from two spray-accompanying technical and economic benefits. These programs involved spray forming aluminum strip reinforced with SiC particulate, and the production of tooling, such as injection molds and dies, using low-melting-point metals. Author

COMPOSITE HOT DRAPE FORMING **c31**
Thomas Ott *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 74-80 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

This program was initiated to replace labor-intensive ply-by-ply layup of composite I-beam posts and angle stiffeners used in the Space Station Freedom (SSF) rack structure. Hot drape forming (HDF) has been successfully implemented by BCAG for 777 composite I-stringers and by Bell Helicopter/Textron for the V-22 I-stingers. The two companies utilize two vastly different approaches to the I-beam fabrication process. A drape down process is used by Bell Helicopter where the compacted ply charge is placed on top of a forming mandrel and heated. When the heated ply charge reached a set temperature, vacuum pressure is applied and the plies are formed over the mandrel. The BCAG 777 process utilizes an inverted forming process where the ply stack is placed on a forming table and the mandrel is inverted and placed upon the ply stack. A heating and vacuum bladder underneath the ply stack form the play stack up onto the mandrels after reaching the temperature setpoint. Both methods have their advantages, but the drape down process was selected for SSF because it was more versatile and could be fabricated from readily available components. Author

THE UNIVERSAL APPLICATIONS OF MICROTUBES AND MICROTUBE COMPOSITES **c24**
Wesley P. Hoffman and Kamleshwar Upadhya *In* NASA, Washignton, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 108-113 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Microtubes are a basic component for a myriad of potential products. They are very small tubes (hundreds can fit in a human hair) that can be made from practically any material. Tubes larger than 1 micron diameter can be made with any cross-sectional shape desired. The significance of microtubes and microtube composites is that they provide the opportunity to miniaturize (even to the nanoscale) numerous products and devices that are currently in existence as well as allowing the fabrication of products that have to date been impossible to produce. Encapsulation of cytotoxic or labile drugs enables targeted delivery and sustained release kinetics that are not available with intravenous

injection. A new liquid-liquid diffusion process has been developed for forming unique microcapsules that contain both aqueous and hydrocarbon soluble drugs. Microgravity experiments, on sounding rockets (1989-92) and Shuttle missions STS-52 (1992) and STS-56 (1993) using an automated Materials Dispersion Apparatus, produced multi-lamellar microcapsules containing both Cis-platinum (anti-tumor drug) and iodinated poppy seed oil (a radiocontrast medium), surrounded by a polyglyceride skin. Microcapsules formed with amoxicillin (antibiotic) or urokinase (a clot dissolving enzyme), co-encapsulated with IPO, are still intact after two years. Microcapsules were formed with the drug so concentrated that crystals formed inside. Multi-layered microspheres, with both hydrophobic drug compartments, can enable diffusion of complementary drugs from the same microcapsule, e.g. antibiotics and immuno-stimulants to treat resistant infections or multiple fibrinolytic drugs to dissolve emboli. Co-encapsulation of enough radio-contrast medium enables oncologists to monitor the delivery of anti-tumor microcapsules to target tumors using computerized tomography and radiography that would track the distribution of microcapsules after release from the intra-arterial catheter. These microcapsules could have important applications in chemotheraphy of certain liver, kidney, brain and other tumors. Author

DUAL USE OF IMAGE BASED TRACKING TECHNIQUES: LASER EYE SURGERY AND LOW VISION PROSTHESIS **c52**
Richard D. Juday *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 131-137 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

With a concentration on Fourier optics pattern recognition, we have developed several methods of tracking objects in dynamic imagery to automate certain space applications such as orbital rendezvous and spacecraft capture, or planetary landing. We are developing two of these techniques for Earth applications in real-time medical image processing. The first is warping of a video image, developed to evoke shift invariance to scale and rotation in correlation pattern recognition. The technology is being applied to compensation for certain field defects in low vision humans. The second is using the optical joint Fourier transform to track the translation of unmodeled scenes. Developed as an image fixation tool to assist in calculating shape from motion, it is being applied to tracking motions of the eyeball quickly enough to keep a laser photocoagulation spot fixed on the retina, thus avoiding collateral damage. ANALYSIS AND AN IMAGE RECOVERY ALGORITHM FOR ULTRASONIC TOMOGRAPHY SYSTEM **c52**
Michael Y. Jin *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 138-145 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

The problem of an ultrasonic reflectivity tomography is similar to that of a spotlight-mode aircraft Synthetic Aperture Radar (SAR) system. The analysis for a circular path spotlight mode SAR in this paper leads to the insight of the system characteristics. It indicates that such a system when operated in a wide bandwidth is capable of achieving the ultimate resolution; one quarter of the wavelength of the carrier frequency. An efficient processing algorithm based on the exact two dimensional spectrum is presented. The results of simulation indicate that the impulse responses meet the predicted resolution performance. Compared to an algorithm previously developed for the ultrasonic reflectivity tomography, the throughput rate of this algorithm is about ten times higher. Author

COMPOSITE REDESIGN OF OBSTETRICAL FORCEPS **c52**
Seth W. Lawson and Stan S. Smeltzer *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 146-150 (For primary document see N94-30440 08-99)
Avail: CASI HC A01/MF A04

Due to the increase in the number of children being born recently, medical technology has struggled to keep pace in certain areas. In these areas, particular needs have arisen to which the subject of this paper is directed. In the area of obstetrics, the forceps design and function has remained relatively unchanged for a number of years. In an effort to advance the technology, NASA Marshall Space Flight Center has been asked by the obstetrical community to help in a redesign of the obstetric forceps. Traditionally the forceps design has been of tubular stainless steel, constructed in two halves which interlock and hinge to provide the gripping force necessary to aid in the delivery of an infant. The stainless steel material was used to provide for ease of cleaning and sterilization. However, one of the drawbacks of the non-flexible steel design is that excessive force can be placed upon an infants head which could result in damage or injury to the infant. The redesign of this particular obstetric tool involves applying NASA's knowledge of advanced materials and state of the art instrumentation to create a tool which can be used freely throughout the obstetrics community without the fear of injury to an infant being delivered. DEVELOPMENT OF THE NASA/BAYLOR VAD **c52**
G. S. Aber, J. W. Akkerman, R. J. Bozeman, Jr., D. R. Saucler, J. W. Bacak, P. A. Svejkovsky, G. A. Damm, K. Mizuguchi, G. P. Noon, and Y. Nose et al *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 151-157 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

A cooperative effort between the NASA/Johnson Space Center (JSC) and the Baylor College of Medicine (BCM) has been underway since 1988 to develop a long-term implantable Ventricular Assist Device (VAD). The VAD is intended to boost the cardiac output of patients with deteriorated cardiac function. For many of these patients, the best alternative is heart transplantation. Heart transplantation is a complex and expensive procedure and usually requires a long waiting period for a donor heart. The condition of the patient often deteriorates during this waiting period which complicates the pre and post-operative care. Because of these factors, the need for a long-term implantable VAD for use as a bridge-to-transplant device or as a permanent assist device has become the focus of much research. The need for a VAD has been estimated at 50,000 to 60,000 patients per year in the United States alone. A device which satisfies all the system performance and reliability requirements has yet to be achieved. However, the development of the NASA/Baylor VAD has progressed to a state in which commercial viability can being to be considered. The device is small, simple, efficient and reliable which meets all requirements for a totally implantable VAD. Author

MONITOR FOR STATUS EPILEPTICUS SEIZURES c52

Mark Johnson and Thomas Simkins *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 168-175 (For primary document see N94-30440 08-99)

Avail: CASI HC A02/MF A04

This paper describes the sensor technology and associated electronics of a monitor designed to detect the onset of a seizure disorder called status epilepticus. It is a condition that affects approximately 3-5 percent of those individuals suffering from epilepsy. This form of epilepsy does not follow the typical cycle of start-peak-end. The convulsions continue until medically interrupted and are life threatening. The mortality rate is high without prompt medical treatment at a suitable facility. The paper describes the details of a monitor design that provides an inexpensive solution to the needs of those responsible for the care of individuals afflicted with this disorder. The monitor has been designed as a cooperative research and development effort involving the United States Army Armament Research, Development, and Engineering Center's Benet Laboratories (Benet) and the Cerebral Palsy Center for the Disabled (Center), in association with the Department of Neurology at Albany Medical College (AMC). Benet has delivered a working prototype of the device for field testing, in collaboration with Albany Medical College. The Center has identified several children in need of special monitoring and has agreed to pursue commercialization of the device. Author

SEED VIABILITY DETECTION USING COMPUTERIZED FALSE-COLOR RADIOGRAPHIC IMAGE ENHANCEMENT c51

J. A. Vozzo and Michael Marko *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 179-187 (For primary document see N94-30440 08-99)

Avail: CASI HC A02/MF A04

Seed radiographs are divided into density zones which are related to seed germination. The seeds which germinate have densities relating to false-color red. In turn, a seed sorter may be designed which rejects those seeds not having sufficient red to activate a gate along a moving belt containing the seed source. This results in separating only seeds with the preselected densities representing biological viability lending to germination. These selected seeds demand a higher market value. Actual false-coloring isn't required for a computer to distinguish the significant gray-zone range. This range can be predetermined and screened without the necessity of red imaging. Applying false-color enhancement is a means of emphasizing differences in densities of gray within any subject from photographic, radiographic, or video imaging. Within the 0-255 range of gray levels, colors can be assigned to any single level or group of gray levels. Densitometric values then become easily recognized colors which relate to the image density. Choosing a color to identify any given density allows separation by morphology or composition (form or function). Additionally, relative areas of each color are readily available for determining distribution of that density by comparison with other densities within the image. Author (revised)

A COMMERCIALIZED, CONTINUOUS FLOW FIBER OPTIC SENSOR FOR TRICHLOROETHYLENE AND HALOFORMS c74

James C. Wells and Mark D. Johnson *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 188-195 (For primary document see N94-30440 08-99)

Avail: CASI HC A02/MF A04

Purus, Inc. has commercialized a fiber optic chemical sensor using technology developed by Lawrence Livermore National Laboratory and licensed from The University of California. The basis for the sensor is the development of color within a reagent when exposed to an analyte. The sensor consists of an optrode, reagent delivery and recover system, fiber optic transmitter-receiver, controller, and display. Reagent is pumped through the optrode. Analyte diffuses across a gas permeable membrane and reacts with the reagent to form a colored product. The colored product is detected by measuring the absorbance of light from a 568 nm diode. Reagents are currently available for TCE and trihalomethanes. Initial reagent chemistry is based on the Fujiwara alkaline pyridine reaction. The optrode contacts only gas streams, but the volatility of the current analytes also allows measurements of aqueous streams, without being affected by aqueous interferents that are non-volatile. Sensitivity of the sensor has been demonstrated to 5 ppb aqueous solutions and 0.1 ppmv in flowing gas streams. Author

COMPUTERIZED IN VITRO TEST FOR CHEMICAL TOXICITY BASED ON TETRAHYMENA SWIMMING PATTERNS c45

David A. Noever, Helen C. Matsos, Raymond J. Cronise, Loren L. Looger, Rachna A. Relwani, and Jacqueline U. Johnson *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 196-208 (For primary document see N94-30440 08-99)

Avail: CASI HC A03/MF A04

An apparatus and method for rapidly determining chemical toxicity was evaluated. The toxicity monitor includes an automated scoring of how motile biological cells (Tetrahymena pyriformis) slow down or otherwise change their swimming patterns in a hostile chemical environment. The device, called the Motility Assay Apparatus (MAA) is tested for 30 second determination of chemical toxicity in 20 aqueous samples containing trace organics and salts. With equal or better detection limits, results compare favorably to in vivo animal tests of eye irritancy, in addition to agreeing for all chemicals with previous manual evaluations of single cell motility. A MODULAR APPROACH FOR AUTOMATED SAMPLE PREPARATION AND CHEMICAL ANALYSIS c45

Michael L. Clark, Terry D. Turner, Kerry M. Klingler, and Randolph Pacetti *In* NASA, Washignton, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 209-218 (For primary document see N94-30440 08-99)

Avail: CASI HC A02/MF A04

Changes in international relations, especially within the past several years, have dramatically affected the programmatic thrusts of the U.S. Department of Energy (DOE). The DOE now is addressing the environmental cleanup required as a result of 50 years of nuclear arms research and production. One major obstacle in the remediation of these areas is the chemical determination of potentially contaminated material using currently acceptable practices. Process bottlenecks and exposure to hazardous conditions pose problems for the DOE. One proposed solution is the application of modular automated chemistry using Standard Laboratory Modules (SLM) to perform Standard Analysis Methods (SAM). The Contaminant Analysis Automation (CAA) Program has developed standards and prototype equipment that will accelerate the development of modular chemistry technology and is transferring this technology to private industry. PHOTOVOLTAIC POWER WITHOUT BATTERIES FOR CONTINUOUS CATHODIC PROTECTION c44

W. W. Muehl, Sr. *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 219-222 (For primary document see N94-30440 08-99)

Avail: CASI HC A01/MF A04

The COASTSYSTA designed, installed, and started up on 20 Jan. 1990, a state-of-the-art stand alone photovoltaic powered impressed current cathodic protection system (PVCPSYS) not requiring any auxiliary/battery backup power for steel and iron submerged structures. The PVCPSYS installed on 775' of steel sheet piling of a Navy bulkhead is continuing to provide complete, continuous corrosion protection. This has been well documented by COASTSYSTA and verified on-site by the U.S. Army Civil Engineering Research Laboratory, Champaign, Illinois and the Navy Energy

Program Office-Photovoltaic Programs, China Lake, California. The Department of Defense (DoD) Photovoltaic Review Committee and Sandia National Laboratories consider this successful and cost effective system a major advance in the application of photovoltaic power. The PVCPSYS uses only renewable energy and is environmentally clean. A patent is pending on the new technology. Other possible PVCPSYS applications are mothballed ships, docks, dams, locks, bridges, marinas, offshore structures, and pipelines. The initial cost savings by installing a PVCPSYS vs. a conventional CP system was in excess of $46,000.00. Author

Avail: CASI HC A02/MF A04

A variety of environmental, safety, and health concerns exist over use of chlorinated and fluorinated cleaning solvents. Sandia National Laboratories, Lawrence Livermore National Laboratories, and the Kansas City Division of AlliedSignal have combined efforts to focus on finding alternative cleaning solvents and processes which are effective, environmentally safe, and compliant with local, state, and federal regulations. An alternative solvent has been identified, qualified, and implemented into production of complex electronic assemblies, where aqueous and semi-aqueous cleaning processes are not allowed. Extensive compatibility studies were performed with components, piece-parts, and materials. Electrical testing and accelerated aging were used to screen for detrimental, long-term effects. A terpene, d-limonene, was selected as the solvent of choice, and it was found to be compatible with the components and materials tested. A brief history of the overall project will be presented, along with representative cleaning efficiency results, compatibility results, and residual solvent data. The electronics industry is constantly searching for proven methods and environmentally-safe materials to use in manufacturing processes. The information in this presentation will provide another option to consider on future projects for applications requiring high levels of quality, reliability, and cleanliness from non-aqueous cleaning processes. SUPERSONIC GAS-LIQUID CLEANING SYSTEM c31
Raoul E. B. Caimi and Eric A. Thaxton *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 232-240 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

A system to perform cleaning and cleanliness verification is being developed to replace solvent flush methods using CFC 113 for fluid system components. The system is designed for two purposes: internal and external cleaning and verification. External cleaning is performed with the nozzle mounted at the end of a wand similar to a conventional pressure washer. Internal cleaning is performed with a variety of fixtures designed for specific applications. Internal cleaning includes tubes, pipes, flex hoses, and active fluid components such as valves and regulators. The system uses gas-liquid supersonic nozzles to generate high impingement velocities at the surface of the object to be cleaned. Compressed air or any inert gas may be used to provide the conveying medium for the liquid. The converging-diverging nozzles accelerate the gas-liquid mixture to supersonic velocities. The liquid being accelerated may be any solvent including water. This system may be used commercially to replace CFC and other solvent cleaning methods widely used to remove dust, dirt, flux, and lubricants. In addition, cleanliness verification can be performed without the solvents which are typically involved. This paper will present the technical details of the system, the results achieved during testing at KSC, and future applications for this system. Author (revised)

REGENERATING USING AQUEOUS CLEANERS WITH OZONE AND ELECTROLYSIS c31
Michael P. McGinness *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 241-247 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

A new process converts organic oil and grease contaminates in used water based cleaners into synthetic surfactants. This permits the continued use of a cleaning solution long after it would have been dumped using previously known methods. Since the organic soils are converted from contaminates to cleaning compounds the need for frequent bath dumps is totally eliminated. When cleaning solutions used in aqueous cleaning systems are exhausted and ready for disposal, they will always contain the contaminates removed from the cleaned parts and drag-in from prior cleaning steps. Even when the cleaner is biodegradable these contaminants will frequently cause the waste cleaning solution to be a hazardous waste. Chlorinated solvents are rapidly being replaced by aqueous cleaners to avoid the new ozone-depletion product-labeling-law. Many industry standard halocarbon based solvents are being completely phased out of production, and their prices have nearly tripled. Waste disposal costs and cradle-to-grave liability are also major concerns for industry today. This new process reduces the amount of water and chemicals needed to maintain the cleaning process. The cost of waste disposal is eliminated because the water and cleaning compounds are reused. Energy savings result by eliminating the need for energy currently used to produce and deliver fresh water and chemicals as well as the energy used to treat and destroy the waste from the existing cleaning processes. This process also allows the cleaning bath to be maintained at the peak performance of a new bath resulting in decreased cycle times and decreased energy consumption needed to clean the parts. This results in a more efficient and cost effective cleaning process. Author (revised)

GAS STREAM PURIFIER c45
Steven J. Adam *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 248-257 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

A gas stream purifier has been developed that is capable of removing corrosive acid, base, solvent, organic, inorganic, and water vapors as well as particulates from an inert mixed gas stream using only solid scrubbing agents. This small, lightweight purifier has demonstrated the ability to remove contaminants from an inert gas stream with a greater than 99 percent removal efficiency. The Gas Stream Purifier has outstanding market and sales potential in manufacturing, laboratory and science industries, medical, automotive, or any commercial industry where pollution, contamination, or gas stream purification is a concern. The purifier was developed under NASA contract NAS9-18200 Schedule A for use in the international Space Station. A patent application for the Gas Stream Purifier is currently on file with the United States Patent and Trademark Office. Author

USING SPACECRAFT TRACE CONTAMINANT CONTROL SYSTEMS TO CURE SICK BUILDING SYNDROME c45
John C. Graf *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 258-265 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Many residential and commercial buildings with centralized, recirculating, heating ventilation and air conditioning systems suffer from 'Sick Building Syndrome.' Ventilation rates are reduced to save energy costs, synthetic building materials off-gas contaminants, and unsafe levels of volatile organic compounds (VOC's) accumulate. These unsafe levels of contaminants can cause irritation of eyes and throat, fatigue and dizziness to building occupants. Increased ventilation, the primary method of treating Sick Building Syndrome is expensive (due to increased energy costs) and recently, the effectiveness of increased ventilation has been questioned. On spacecraft venting is not allowed, so the primary methods of air quality control are; source control, active filtering, and destruction of VOC's. Four non-venting contaminant removal technologies; strict material selection to provide source control, ambient temperature catalytic oxidation, photocatalytic oxidation, and uptake by higher plants, may have potential application for indoor air quality control. A NEW MATERIAL FOR REMOVING HEAVY METALS FROM WATER **c45**
Warren H. Philipp, Jr. and Kenneth W. Street, Jr. *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 266-272 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

The NASA Lewis Research Center developed and is patenting a new high capacity ion exchange material (IEM) that removes toxic metals from contaminated water in laboratory tests. The IEM can be made into many forms, such as thin films, coatings, pellets, and fibers. As a result, it can be adapted to many applications to purify contaminated water wherever it is found, be it in waste water treatment systems, lakes, ponds, industrial plants, or in homes. Laboratory tests have been conducted on aqueous solutions containing only one of the following metal cations: lead, copper, mercury, cadmium, silver, chromium (III), nickel, zinc, and yttrium. Tests were also conducted with: (1) calcium present to determine its effects on the uptake of cadmium and copper, and (2) uranium and lanthanides which are stand-ins for other radioactive elements, (3) drinking water for the removal of copper and lead, and (3) others compositions. The results revealed that the IEM removes all these cations, even in the presence of the calcium. Of particular interest are the results of the tests with the drinking water: the lead concentration was reduced from 142 ppb down to 2.8 ppb (well below the accepted EPA standard). Author

DEWATERING OF CONTAMINATED RIVER SEDIMENTS **c45**
Ronald H. Church, Carl W. Smith, and Bernard J. Scheiner *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 273-282 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Dewatering of slurries has been successfully accomplished by the proper use of polymers in flocculating the fine particulate matter suspended in mineral processing streams. The U.S. Bureau of Mines (USBM) entered into a cooperative research effort with the U.S. Army Corps of Engineers (Corps) for the purpose of testing and demonstrating the applicability of mining flocculation technology to dredging activities associated with the removal of sediments from navigable waterways. The Corps has the responsibility for maintaining the navigable waterways in the United States. Current technology relies primarily on dredging operations which excavate the material from the bottom of waterways. The Corps is testing new dredging technology which may reduce resuspension of sediments by the dredging operation. Pilot plant dredging equipment was tested by the Corps which generated larger quantities of water when compared to conventional equipment, such as the clam shell. The transportation of this 'excess' water adds to the cost of sediment removal. The process developed by the USBM consists of feed material from the barge being pumped through a 4-in line by a centrifugal pump and exiting through a 4-in PVC delivery system. A 1,000-gal fiberglass tank was used to mix the polymer concentrate. The polymer was pumped through a 1-in line using a variable speed progressive cavity pump and introduced to the 4-in feed line prior to passing through a 6-in by 2-ft static mixer. The polymer/feed slurry travels to the clarifying tank where the flocculated material settled to the bottom and allowed 'clean' water to exit the overflow. A pilot scale flocculation unit was operated on-site at the Corps' 'Confined Disposal Facility' in Buffalo, NY. Author

(Contract DE-AC06-76RL-01830)
Avail: CASI HC A02/MF A04

A novel flow-through hydrothermal method used to synthesize nanoscale powders is introduced by Pacific Northwest Laboratory. The process, Rapid Thermal Decomposition of precursors in Solution (RTDS), uniquely combines high-pressure and high-temperature conditions to rapidly form nanoscale particles. The RTDS process was initially demonstrated on a laboratory scale and was subsequently scaled up to accommodate production rates attractive to industry. The process is able to produce a wide variety of metal oxides and oxyhydroxides. The powders are characterized by scanning and transmission electron microscopic methods, surface-area measurements, and x-ray diffraction. Typical crystallite sizes are less than 20 nanometers, with BET surface areas ranging from 100 to 400 sq m/g. A description of the RTDS process is presented along with powder characterization results. In addition, data on the sintering of nanoscale ZrO2 produced by RTDS are included. Author

Avail: CASI HC A01/MF A04

Graphite surfaces can be hardened and protected from erosion by hydrogen at high temperatures by refractory metal carbide coatings, which are usually prepared by chemical vapor deposition (CVD) or chemical vapor reaction (CVR) methods. These techniques rely on heating the substrate to a temperature where a volatile metal halide decomposes and reacts with either a hydrocarbon gas or with carbon from the substrate. For CVR techniques, deposition temperatures must be in excess of 2000 C in order to achieve favorable deposition kinetics. In an effort to lower the bulk substrate deposition temperature, the use of laser interactions with both the substrate and the metal halide deposition gas has been employed. Initial testing involved the use of a CO2 laser to heat the surface of a graphite substrate and a KrF excimer laser to accomplish a photodecomposition of TaCl5 gas near the substrate. The results of preliminary experiments using these techniques are described. Author

USBI Company, a Division of Pratt & Whitney Government Engines and Space Propulsion, is involved in corrosion and environmental research and development activities both at their headquarters in Huntsville, Alabama and their Florida Operations at Kennedy Space Center, Florida. The programs involve the development of environmentally compatible materials that improve the corrosion protection of expensive Solid Rocket Boosters (SRB) that are part of the Space Shuttle systems developed and managed by Marshall Space Flight Center in Huntsville, Alabama. Coatings For Industry, a paint manufacturer in Souderton, PA helped formulate and produce the first lot of BOOSTERCOAT paint. High strength aluminum aerospace flight hardware exposed to harsh seacoast environments and seawater immersion presently uses high volatile organic compound (VOC) chromated and lead bearing primers and epoxy topcoats for corrosion protection. Epoxy paint tends to be brittle and has relatively low ultraviolet (UV) exposure resistance. A

unique, environmentally compatible, non-leaded/non-chromated, low VOC polyurethane single coat (primer/topcoat) trade named BOOSTERCOAT has been developed for excellent corrosion protection, flexibility, adhesion, chemical and solvent resistance properties. This report will discuss the development of BOOSTERCOAT and the potential opportunities for commercial use in the energy, transportation, chemical, maritime, structural fields. Author

A new class of liquid curable elastomers with unusual strength and elasticity has been developed at the Naval Air Warfare Center Weapons Division, China Lake. Over the years, studies have been conducted on polymer structure and its influence on the mechanical properties of the ensuing composites. Different tools, including nuclear magnetic resonance, have been used. This paper presents a summary of the factors controlling the mechanical behavior of composites produced with the new liquid curable elastomers, including the effects of plasticizers. It also provides an overview of the nuclear magnetic resonance study on polymer structure, the composition and properties of some live and inert formulations produced at China Lake, and some possible peace-time applications for these new elastomeric materials. SOLVENTLESS, CURABLE FLUID OLIGOMERIC SYSTEMS FOR HIGH PERFORMANCE MICROWAVE, ACOUSTICAL AND MECHANICAL APPLICATIONS **c27**
G. M. LeFave, Leo Stanton, and Jim Foreman *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 337-343 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

While establishing the basis for a 'Technology 2000' product plan several years ago we plugged in the usual factors contributing toward product success: price/performance justifiable; profitable, warranting high quality maintenance, enhancement, and specific property improvement; narrow inventory requirements; and raw material integrable backwards with easily variable properties (molecular weight, functionality, and isomer control). We resolved this by selecting radical functional, low molecular weight polybutadiene liquid polymers. Encouraged by the need for solid rocket binders, several companies embarked on various perceptions of binder performance requirements over four decades ago. Initially dominated by progress of liquid polysulfides, soon a few settled primarily upon polybutadiene based binders. Such an approach in a few instances was exploited quite viably with a series of functional group terminated liquid polybutadienes: hydroxyl, mercaptan, carboxyl, vinyl, and amine. Good results are obtained for oligomers, liquid polymers, and their hybrids. The only significant limits on compounded products has been solvent resistance and oxidative sensitivity, unless sufficient proportion of sulfide or nitrile moiety is incorporated. For convenience, they have been grouped under the trademarks Nylane, Seamax, Oligomax, and Castomax.

PLASMA TREATMENT OF POLYMER DIELECTRIC FILMS TO IMPROVE CAPACITIVE ENERGY STORAGE **c27**
A. Yializis, M. Binder, and R. J. Mammone *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 344-351 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Demand for compact instrumentation, portable field equipment, and new electromagnetic weapons is creating a need for new dielectric materials with higher energy storage capabilities. Recognizing the need for higher energy storage capacitors, the Army Research Lab at Fort Monmouth, NJ, initiated a program a year ago to investigate potential methods for increasing the dielectric strength of polyvinylidene difluoride (PVDF) film, which is the highest energy density material commercially available today. Treatment of small area PVDF films in a CF4/O2 plasma showed that the dielectric strength of PVDF films can be increased by as much as 20 percent when treated in a 96 percent CF4/4 percent O2 plasma. This 44 percent increase in energy storage of a PVDF capacitor is significant considering that the treatment can be implemented in a conventional metallizing chamber, with minimum capital investment. The data shows that improved breakdown strength may be unique to PVDF film and the particular CF4/O2 gas mixture, because PVDF film treated with 100 percent CF4, 100 percent O2, Ar gas plasma, and electron irradiation shows no improvement in breakdown strength. Other data presented includes dissipation factor, dielectric constant, and surface tension measurements. Author (revised)

DEVELOPMENT OF RADIATION RESISTANT ELECTRICAL CABLE INSULATIONS **c27**
B. S. Lee, P. Soo, and D. R. MacKenzie *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 352-360 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Two new polyethylene cable insulations have been formulated for nuclear applications and have been tested under gamma radiation. Both insulations are based on low density polyethylene, one with PbO and the other with Sb2O3 as additives. The test results show that the concept of using inorganic antioxidants to retard radiation initiated oxidation (RIO) is viable. PbO is more effective than Sb2O3 in minimizing RIO. Author (revised)

FOUR ADVANCES IN CARBON-CARBON MATERIALS TECHNOLOGY **c24**
Howard G. Maahs, Wallace L. Vaughn, and Witold Kowbel *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 361-370 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Carbon-carbon composites are a specialty class of materials having many unique properties making these composites attractive for a variety of demanding engineering applications. Chief among these properties are exceptional retention of mechanical properties at temperatures as high as 4000 F, excellent creep resistance, and low density (1.6 to 1.8 g/cu cm). Although carbon-carbon composites are currently in service in a variety of applications, much development work remains to be accomplished before these materials can be considered to be fully mature, realizing their full potential. Four recent technology advances holding particular promise for overcoming current barriers to the wide-spread commercialization of carbon-carbon composites are described. These advances are: markedly improved interlaminar strengths (more than doubled) of two dimensional composites achieved by whiskerization of the fabric reinforcing plies, simultaneously improved oxidation resistance and mechanical properties achieved by the incorporation of matrix-phase oxidation inhibitors based on carborane chemistry, improved oxidation resistance achieved by compositionally graded oxidation protective coatings, and markedly reduced processing times (hours as opposed to weeks or months) accomplished through a novel process of carbon infiltration and coatings deposition based on the use of liquid-phase precursor materials. CASTING OF WELDABLE GRAPHITE/MAGNESIUM METAL MATRIX COMPOSITES WITH BUILT-IN METALLIC INSERTS **c24**
Jonathan A. Lee, Uday Kashalikar, and Patricia Majkowski *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 371-376 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Technology innovations directed at the advanced development of a potentially low cost and weldable graphite/magnesium metal matrix composites (MMC) through near net shape pressure casting are described. These MMC components uniquely have built-in metallic inserts to provide

an innovative approach for joining or connecting other MMC components through conventional joining techniques such as welding, brazing, mechanical fasteners, etc. Moreover, the metallic inserts trapped within the MMC components can be made to transfer the imposed load efficiently to the continuous graphite fiber reinforcement thus producing stronger, stiffer, and more reliable MMC components. The use of low pressure near net shape casting is economical compared to other MMC fabrication processes. These castable and potentially weldable MMC components can provide great payoffs in terms of high strength, high stiffness, low thermal expansion, lightweight, and easily joinable MMC components for several future NASA space structural, industrial, and commercial applications. IMPROVED CONSTRUCTION MATERIALS FOR POLAR REGIONS USING MICROCELLULAR THERMOPLASTIC FOAMS **c27**
Daniel J. Cunningham *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 385-391 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

Microcellular polymer foams (MCF) are thermoplastic foams with very small cell diameters, less than 10 microns, and very large cell densities, 10(exp 9) to 10(exp 15) cells per cubic centimeter of unfoamed material. The concept of foaming polymers with microcellular voids was conceived to reduce the amount of material used for mass-produced items without compromising the mechanical properties. The reasoning behind this concept was that if voids smaller than the critical flaw size pre-existing in polymers were introduced into the matrix, they would not affect the overall strength of the product. MCF polycarbonate (PC), polystyrene (PS), and polyvinyl chloride (PVC) were examined to determine the effects of the microstructure towards the mechanical properties of the materials at room and arctic temperatures. Batch process parameters were discovered for these materials and foamed samples of three densities were produced for each material. To quantify the toughness and strength of these polymers, the tensile yield strength, tensile toughness, and impact resistance were measured at room and arctic temperatures. The feasibility of MCF polymers has been demonstrated by the consistent and repeatable MCF microstructures formed, but the improvements in the mechanical properties were not conclusive. Therefore the usefulness of the MCF polymers to replace other materials in arctic environments is questionable. Author (revised)

USE OF MAGNETIC COMPRESSION TO SUPPORT TURBINE ENGINE ROTORS **c37**
Chris J. Pomfret *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 395-410 (For primary document see N94-30440 08-99)
Avail: CASI HC A03/MF A04

Ever since the advent of gas turbine engines, their rotating disks have been designed with sufficient size and weight to withstand the centrifugal forces generated when the engine is operating. Unfortunately, this requirement has always been a life and performance limiting feature of gas turbine engines and, as manufacturers strive to meet operator demands for more performance without increasing weight, the need for innovative technology has become more important. This has prompted engineers to consider a fundamental and radical breakaway from the traditional design of turbine and compressor disks which have been in use since the first jet engine was flown 50 years ago. Magnetic compression aims to counteract, by direct opposition rather than restraint, the centrifugal forces generated within the engine. A magnetic coupling is created between a rotating disk and a stationary superconducting coil to create a massive inwardly-directed magnetic force. With the centrifugal forces opposed by an equal and opposite magnetic force, the large heavy disks could be dispensed with and replaced with a torque tube to hold the blades. The proof of this concept has been demonstrated and the thermal management of such a system studied in detail; this aspect, especially in the hot end of a gas turbine engine, remains a stiff but not impossible challenge. The potential payoffs in both military and commercial aviation and in the power generation industry are sufficient to warrant further serious studies for its application and optimization. A FUTURE, INTENSE SOURCE OF NEGATIVE HYDROGEN IONS **c72**
Hugh Siefken and Charles Stein *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 411-420 (For primary document see N94-30440 08-99)
Avail: CASI HC A02/MF A04

By directly heating lithium hydride in a vacuum, up to 18 micro-A/sq cm of negative hydrogen has been obtained from the crystal lattice. The amount of ion current extracted and analyzed is closely related to the temperature of the sample and to the rate at which the temperature is changed. The ion current appears to be emission limited and saturates with extraction voltage. For a fixed extraction voltage, the ion current could be maximized by placing a grid between the sample surface and the extraction electrode. Electrons accompanying the negative ions were removed by a magnetic trap. A Wein velocity filter was designed and built to provide definitive mass analysis of the extracted ion species. This technique when applied to other alkali hydrides may produce even higher intensity beams possessing low values of emittance. Author (revised)

FIBER OPTICAL SOLAR SIMULATOR **c44**
Bhushan L. Sopori and Craig Marshall *In* NASA, Washington, Technology 2003: The Fourth National Technology Transfer Conference and Exposition, Volume 1 Feb. 1994 p 421-428 (For primary document see N94-30440 08-99)
(Contract DE-AC02-83CH-10093)
Avail: CASI HC A02/MF A04

A new solar simulator is described whose output closely matches a desired solar spectrum for testing photovoltaic cells. The accurate simulation of the spectrum is attained by combining three light beams, each tailored to have suitable spectral content. The three light beams, derived from two sources, are filtered and 'mixed' by means of a trifurcated, randomized fiber cable so that when superimposed they add up to the desired solar spectrum. The fiber optic solar simulator (FOSS) simplifies solar cell testing by greatly reducing measurement time, obviating need for spectral mismatch corrections, and improving the accuracy of measurement. Other applications of FOSS are also described. Author (revised)

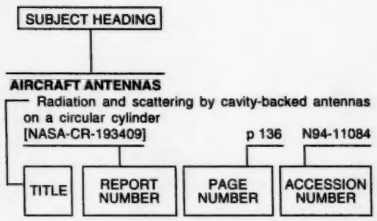
The purpose of this publication is to highlight selected scientific challenges that have been undertaken by the DOE Energy Research community. The high quality of the research reflected in these contributions underscores the growing importance both to the Grand Challenge scientific efforts sponsored by DOE and of the related supporting technologies that the National Energy Research Supercomputer Center (NERSC) and other facilities are able to provide. The continued improvement of the computing resources available to DOE scientists is prerequisite to ensuring their future progress in solving the Grand Challenges. Titles of articles included in this publication include: the numerical tokamak project; static and animated molecular views of a tumorigenic chemical bound to DNA; toward a high-performance climate systems model; modeling molecular processes in the environment; lattice Boltzmann models for flow in porous media; parallel algorithms for modeling superconductors; parallel computing at the Superconducting Super Collider Laboratory; the advanced combustion modeling environment; adaptive methodologies for computational fluid dynamics; lattice simulations of quantum chromodynamics; simulating high-intensity charged-particle beams for the design of high-power accelerators; and electronic structure and phase stability of random alloys. DOE

SUBJECT INDEX

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus*.

Computational analysis of high resolution unsteady airloads for rotor aeroacoustics
[NASA-CR-194894] p 3480 N94-30274
Index of NPL acoustics publications 1981-1990
[NPL-RSA(EXT)-0044] p 3480 N94-30786
ACOUSTO-OPTICS
Photorefractive adaptive antenna array processor
[AD-A275762] p 3241 N94-28762
Spectral and polarimetric analysis of hyperspectral data collected by an acousto-optic tunable filter system
[AD-A275076] p 3329 N94-29095
ACQUISITION
Acquisition time analysis of noncoherent PN sequence acquisition schemes
[AD-A275017] p 3244 N94-29094
ACRYLIC RESINS
A new material for removing heavy metals from water p 3354 N94-30471
ACRYLONITRILES
Ballistic performance of polycarbonate/polyester and polycarbonate/styrene- acrylonitrile microlayer sheets
[AD-A275462] p 3177 N94-28735
ACTIVATION
Study of activation data of metal samples from LDEF-1 and Spacelab-2
[NASA-CR-195802] p 3205 N94-29736
ACTIVATION ENERGY
Novel techniques applied to polymer lifetime predictions
[DE94-005095] p 3218 N94-30102
Ionic conduction mechanisms in CaF2 and CaF2-Al2O3 nanocomposite films on Al2O3 substrates
[DE94-004792] p 3520 N94-30773
ACTIVE CONTROL
Integrated active and passive control design methodology for the LaRC CSI evolutionary model
[NASA-CR-4580] p 3164 N94-28417
Fluid dynamic noise in a centrifugal pump
[AD-A275264] p 3477 N94-28904
Active control of delaminations in smart composite structures p 3181 N94-29593
Miniature linear-to-rotary motion actuator p 3163 N94-29647
An actively cooled floating element skin friction balance for direct measurement in high enthalpy supersonic flows p 3289 N94-29824
Position control of a flexible beam with active damping of vibrations
[ISBN-0-315-85841-9] p 3321 N94-30033
Design and control of active vision based mechanisms for intelligent robots
[AIAA PAPER 94-1196-CP] p 3442 N94-30547
A performance analysis method for distributed real-time robotic systems: A case study of remote teleoperation
[AIAA PAPER 94-1212-CP] p 3445 N94-30563
ACTIVE GALACTIC NUCLEI
Infrared properties of obscuring dust tori in active galactic nuclei p 3545 N94-29832
Broad H alpha profiles of radio-loud active galactic nuclei and rapid profile variability in Seyfert and radio galaxies p 3552 N94-29989
Correlation analysis on optical and radio light curves for a large sample of active galactic nuclei p 3546 N94-29992
The effects of relativistic neutrons on nonthermal models of active galactic nuclei p 3547 N94-29993
Optical depth effects in cluster cooling flows p 3541 N94-30800
ACTIVITY
Study of activation data of metal samples from LDEF-1 and Spacelab-2
[NASA-CR-195802] p 3205 N94-29736
ACTIVITY (BIOLOGY)
The MSRC ab initio methods benchmark suite: A measurement of hardware and software performance in the area of electronic structure methods
[DE94-006428] p 3514 N94-30001
ACTIVITY CYCLES (BIOLOGY)
Surface differential rotation in a sample of cool dwarf stars p 3545 N94-29827
Circadian countermeasures for shiftworkers during USMP-2: A report to mission management
[NASA-CR-195260] p 3402 N94-30188
ACTS
Remote observatory access via the advanced communications technology satellite p 3253 N94-29894
ACTUATORS
Collocated tunable wavenumber sensor/actuators for smart structures
[AD-A275872] p 3241 N94-28755
Feedback control of a three-link planar under-actuated manipulator using a surge velocity
[AD-A275159] p 3435 N94-29044
Rotary actuator
[NASA-CASE-MFS-28581-1] p 3205 N94-29447
The 27th Aerospace Mechanisms Symposium
[NASA-CP-3205] p 3160 N94-29627
A gimbaled low noise momentum wheel p 3162 N94-29640
Low melting temperature alloy deployment mechanism and recent experiments p 3163 N94-29644
Miniature linear-to-rotary motion actuator p 3163 N94-29647
Design and test of electromechanical actuators for thrust vector control p 3163 N94-29650
SP-100 control drive assembly development p 3163 N94-29651
Toward milli-Newton electro- and magneto-static microactuators p 3238 N94-29784
Control of micromachined deformable mirrors p 3239 N94-29787
On possibility to create the scintillation trigger for liquid-argon neutrino detector
[DE94-607844] p 3489 N94-30050
Nearly time-optimal feedback control of a magnetically levitated photolithography positioning system
[DE94-005288] p 3266 N94-30055
Damage identification in composites using built-in piezoelectrics p 3184 N94-30355
Local interaction control for space construction p 3170 N94-30960
ACUITY
Microactuator production via high aspect ratio, high edge acuity metal fabrication technology p 3235 N94-29770
ACYLATION
Group transfer and electron transfer reactions of organometallic complexes: Summary of research accomplished in 1993
[DE94-004963] p 3200 N94-30770
ADA (PROGRAMMING LANGUAGE)
Comparing Ada and FORTRAN lines of code: Some experimental results
[AD-A275322] p 3409 N94-28878
Ada, object-oriented techniques, and concurrency in teaching data structures and file management
[AD-A275385] p 3411 N94-29201
A common Ada run-time system for avionics software p 3150 N94-29331
Ada run time system certification for avionics applications p 3150 N94-29332
The UNICON approach to through-life support and evolution of software-intensive systems p 3416 N94-29340
Aid to Ada component reuse at Aerospatiale Cannes (France)
[REPT-932-440-102] p 3418 N94-29418
ADAPTATION
Work conditions assessment in pilots and ground personnel under high weather temperatures p 3382 N94-28444
Photorefractive adaptive antenna array processor
[AD-A275762] p 3241 N94-28762
Circadian countermeasures for shiftworkers during USMP-2: A report to mission management
[NASA-CR-195260] p 3402 N94-30188
ADAPTIVE CONTROL
Application of digital control theory to adaptive grid generation p 3127 N94-28980

Robust adaptive control and filtering
p 3437 N94-29895
Adaptive power control as a fade countermeasure on satellite links p 3253 N94-29897
Robust adaptive control of a mechanical manipulator
p 3449 N94-30806

ADAPTIVE FILTERS
Removal of coherent Extremely Low Frequency (ELF) background noise by adaptive noise cancellation
[AD-A275016] p 3243 N94-28898
Robust adaptive control and filtering
p 3437 N94-29895

ADDING CIRCUITS
Realization of function logics by means of transmission gate
[REPT-93-061] p 3429 N94-30936

ADDITIVES
High resistivity buffer layers by oxygen doping
[AD-A274986] p 3513 N94-29125
Research and development of high thermal stability fuels p 3192 N94-29261

ADDUCTS
Synthesis and molecular structures of R(Me3CCH2)2In-E(SiMe3) (R = Me3CCH2, E = P or As; R = Me, E = P)
[AD-A275020] p 3486 N94-29131

ADHESION
Pull-test adhesion measurements of diamondlike carbon films on silicon carbide, silicon nitride, aluminum oxide, and zirconium oxide
[DE94-005469] p 3211 N94-28536
Adhesion of electrolessly deposited Ni(P) on alumina ceramic
[ETN-94-95358] p 3212 N94-28539
High damage threshold anti-reflectors by physical vapor deposited amorphous fluoropolymer
[DE94-004865] p 3212 N94-28560
Rules and definition of the range of paints applied on aeronautical structrural composites
[REPT-932-600-106] p 3215 N94-29459

ADHESION TESTS
Pull-test adhesion measurements of diamondlike carbon films on silicon carbide, silicon nitride, aluminum oxide, and zirconium oxide
[DE94-005469] p 3211 N94-28536
Adhesion of electrolessly deposited Ni(P) on alumina ceramic
[ETN-94-95358] p 3212 N94-28539

ADHESIVE BONDING
Composite panel failure analysis and improvement plan
[AD-A275655] p 3176 N94-28653
Preliminary evaluation of hybrid titanium composite laminates
[NASA-TM-109095] p 3180 N94-29472

ADHESIVES
Solventless, curable fluid oligomeric systems for high performance microwave, acoustical and mechanical applications p 3223 N94-30478

ADIABATIC CONDITIONS
Quasi-adiabatic motion of energetic particles in a dipole magnetic field
[DE94-607322] p 3362 N94-29935

ADSORBENTS
Low frequency dynamics of CO/Cu-breakdown of Born-Oppenheimer approximation
[DE94-005508] p 3510 N94-28512
Journal of NIRE, Vol. 2, No. 2
[JTN-94-80552] p 3187 N94-28675
Properties of adsorbents for collection and analysis of trace amount of chlorofluorocarbons in air
p 3188 N94-28680

ADSORPTION
Low frequency dynamics of CO/Cu-breakdown of Born-Oppenheimer approximation
[DE94-005508] p 3510 N94-28512
Fundamental studies of hydrogen interaction with supported meta and bimetallic catalysts
[DE94-004887] p 3202 N94-28562
Nuclear magnetic relaxation studies of semiconductor nanocrystals and solids
[DE94-006301] p 3520 N94-30842
Influence of surface defects and local structure on oxygenate reaction pathways over metal oxide surfaces
[DE94-005680] p 3522 N94-30901

ADVANCED SOLID ROCKET MOTOR (STS)
Robotic NDE inspection of advanced solid rocket motor casings
[AIAA PAPER 94-1222-CP] p 3446 N94-30571

ADVANCED VERY HIGH RESOLUTION RADIOMETER
Objective analysis of a coastal ocean eddy using satellite AVHRR and in situ hydrographic data
[AD-A275715] p 3376 N94-28642

ADVECTION
Evolution of the large-scale vortices in turbulent mixing-layers p 3273 N94-29686
Effects of diffusion and inertia on chaotic mixing: A computational and experimental study
p 3488 N94-29903
Evaluation of discretization schemes for advection-diffusion equations
[CWI-NM-R9311] p 3461 N94-30751

AERIAL PHOTOGRAPHY
The Image Digitizing System (IDS)
[AD-A275341] p 3329 N94-29213
The use of digital stereo photogrammetric methods in historical photo analysis
[AD-A275287] p 3288 N94-29437
The extraction and representation of forest inventory information using continuous density surfaces
[ISBN-0-315-85658-0] p 3334 N94-30236

AERIAL RECONNAISSANCE
MODIS technical report series. Volume 3: MODIS airborne simulator level 1B data user's guide
[NASA-TM-104594] p 3231 N94-29385
Cockpit video: A low cost BDA source
[AD-A275228] p 3150 N94-29389
Payload central control for unmanned aircraft
p 3155 N94-30284

AEROACOUSTICS
A non-local computational boundary condition for duct acoustics
[NASA-TM-109091] p 3478 N94-29382
Aeroacoustic sensitivity analysis and optimal aeroacoustic design of turbomachinery blades
[NASA-CR-195786] p 3153 N94-30013
Computational analysis of high resolution unsteady airloads for rotor aeroacoustics
[NASA-CR-194894] p 3480 N94-30274

AEROBRAKING
Particle kinetic simulation of high altitude hypervelocity flight
[NASA-CR-194535] p 3131 N94-29893

AERODYNAMIC CHARACTERISTICS
Holographic interferometry: A user's guide
[DE94-003136] p 3286 N94-28466
Exploring QDES as a tool for determining limits of achievable performance in aircraft design
[AD-A275359] p 3146 N94-28998
Study of bridge design and technology
[PB94-137916] p 3121 N94-29160
Low-speed longitudinal aerodynamic characteristics of a flat-plate planform model of an advanced fighter configuration
[NASA-TM-109045] p 3130 N94-29443
An experimental and theoretical study of the aerodynamic characteristics of some generic missile concepts at Mach numbers from 2 to 6.8
[NASA-TM-109110] p 3130 N94-29473
Algorithm and code development for unsteady three-dimensional Navier-Stokes equations
[NASA-CR-195774] p 3277 N94-29942
Aircraft aerodynamics with deflected jets in ground effect p 3132 N94-29973
Expanding the waverider design space using arbitrary generating flowfields p 3148 N94-30516
International collaborative research in wind turbine rotor aerodynamics
[DE94-000244] p 3339 N94-30602

AERODYNAMIC CONFIGURATIONS
An experimental investigation of the effect of leading edge extensions on directional stability and the effectiveness of forebody nose strakes
p 3155 N94-29728
Three-dimensional flow characteristics downstream of a blade endwall corner p 3280 N94-30229
The design of a system of codes for industrial calculations of flows around aircraft and other complex aerodynamic configurations
[PB94-125598] p 3133 N94-30387
Calculus of variations applied to 2D multi-point airfoil design
[PB94-125457] p 3133 N94-30401

AERODYNAMIC DRAG
Unsteady aerodynamic computations around NACA0012 at high angles of attack
p 3126 N94-28969
Nominally two-dimensional flow about a normal flat plate p 3275 N94-29838
Aerodynamic characteristics of a propeller-powered high-lift semispan wing
[NASA-TM-4541] p 3132 N94-29937
Potential of the ramjet engine for hypersonic flight speeds p 3153 N94-30935

AERODYNAMIC INTERFERENCE
Experimental studies of transonic flow field near a longitudinally slotted wind tunnel wall
[NASA-TP-3392] p 3130 N94-29545
Prospects of time-linearized unsteady calculation methods for exponentially diverging motions in aeroelasticity
[PB94-126224] p 3134 N94-30740
Aerodynamic analysis of slipstream/wing/nacelle interference for preliminary design of aircraft configurations
[AD-B173651] p 3135 N94-30916

AERODYNAMIC LOADS
Structural/aerodynamic blade analyzer (SAB) user's guide, version 1.0
[NASA-CR-194460] p 3151 N94-29103
Aeroacoustic sensitivity analysis and optimal aeroacoustic design of turbomachinery blades
[NASA-CR-195786] p 3153 N94-30013
Computational analysis of high resolution unsteady airloads for rotor aeroacoustics
[NASA-CR-194894] p 3480 N94-30274
A modernised HST of NLR
[AD-B179220] p 3158 N94-30423
International collaborative research in wind turbine rotor aerodynamics
[DE94-000244] p 3339 N94-30602
Prospects of time-linearized unsteady calculation methods for exponentially diverging motions in aeroelasticity
[PB94-126224] p 3134 N94-30740

AERODYNAMIC NOISE
Determination of sound power levels of air terminal units according to ISO 5135-Nordic inter-laboratory tests, Nordtest project no. 968-91
[PB94-137411] p 3477 N94-29175
Experiments on the aerodynamic generation of noise in centrifugal turbomachinery p 3480 N94-30804

AERODYNAMIC STABILITY
Closed loop vibrational control: Theory and applications
[AD-A275451] p 3154 N94-28632
Exploring QDES as a tool for determining limits of achievable performance in aircraft design
[AD-A275359] p 3146 N94-28998
Study of bridge design and technology
[PB94-137916] p 3121 N94-29160

AERODYNAMIC STALLING
A free-wake Euler and Navier-Stokes CFD method and its application to helicopter rotors including dynamic stall
[AD-A275416] p 3129 N94-29197

AERODYNAMICS
Aeronautical engineering: A cumulative index to a continuing bibliography (supplement 300)
[NASA-SP-7037(300)] p 3121 N94-28537
Aerodynamic design using parallel processors
[AD-A275470] p 3122 N94-28674
Experimental investigation of three-dimensional vortex-airfoil interaction in a supersonic stream
[AD-A275107] p 3122 N94-28899
Proceedings of the 10th NAL Symposium on Aircraft Computational Aerodynamics
[NAL-SP-19] p 3123 N94-28946
ENGRID: A graphical interactive code for the computation of structured grids for blocked flow domains
p 3124 N94-28956
Aerothermochemical calculations in afterburners
p 3154 N94-29258
Algorithm and code development for unsteady three-dimensional Navier-Stokes equations
[NASA-CR-195774] p 3277 N94-29942
An experimental study of the aerodynamics of a swept and unswept semispan wing with a simulated glaze ice accretion
[NASA-CR-195330] p 3133 N94-30152
An interactive educational tool for compressible aerodynamics
[NASA-TM-106568] p 3422 N94-30175

AEROELASTICITY
Turbomachinery forced response prediction system (FREPS): User's manual
[NASA-CR-194465] p 3319 N94-29104
Time-marching aeroelastic and spatial adaptation procedures on triangular and tetrahedral meshes using an unstructured-grid Euler method p 3131 N94-29877
Algorithm and code development for unsteady three-dimensional Navier-Stokes equations
[NASA-CR-195774] p 3277 N94-29942
Development of a method to predict transonic limit cycle oscillation characteristics of fighter aircraft (continued)
[NLR-TP-92156-U] p 3148 N94-30342
Sensitivity analysis of the static aeroelastic response of a wing p 3134 N94-30525
Prospects of time-linearized unsteady calculation methods for exponentially diverging motions in aeroelasticity
[PB94-126224] p 3134 N94-30740

AEROEMBOLISM
Decompression sickness risk versus time and altitude
[AD-A275261] p 3391 N94-29071

AEROGELS
Alkylene-bridged polygerm- and polygermsilsesqui-oxanes: New hybrid organic-inorganic materials
[DE94-005096] p 3174 N94-28557

AERONAUTICAL ENGINEERING
Aeronautical engineering: A cumulative index to a continuing bibliography (supplement 300)
[NASA-SP-7037(300)] p 3121 N94-28537
Proceedings of the 10th NAL Symposium on Aircraft Computational Aerodynamics
[NAL-SP-19] p 3123 N94-28946
Engineering of systems for application of scientific computing in industry p 3123 N94-28947
Monte Carlo simulation or normal shock wave. Part 2: VHS model and VSS model p 3123 N94-28948
Variable soft sphere molecular model in the Monte Carlo simulation of air species p 3123 N94-28949
Rarefied gas numerical wind tunnel. Part 8: HOPE p 3123 N94-28950
Numerical simulation of arc heated wind tunnel flow p 3123 N94-28951
Numerical simulation of unsteady aerodynamic heating induced by shock reflections p 3123 N94-28952
Numerical simulation of steady Mach reflection by shock capturing schemes p 3123 N94-28953
Higher-order accurate numerical simulation of 3D supersonic mixing layers p 3124 N94-28954
Numerical simulation of aerothermodynamic heating of hypersonic space transportation vehicles p 3124 N94-28955
Transonic expanding flow through axially symmetric orifices p 3128 N94-28985
Similarity between turbulent flows through curved pipe and orthogonal rotating pipe p 3128 N94-28986
Fishermans Bend: A centre of Australian aviation
[AD-A274981] p 3121 N94-29090

AERONAUTICS
Research and technology, 1992
[NASA-TM-103996] p 3555 N94-29891

AERONOMY
NOAA Aeronomy Laboratory long-path OH experiment, Fritz Peak Observatory, Colorado p 3344 N94-28598

AEROSOLS
Measurement of elemental speciation by liquid chromatography: Inductively coupled plasma mass spectrometry (LC-ICP-MS) with the Direct Injection Nebulizer (DIN)
[DE94-005261] p 3187 N94-28483
Studies of marine aerosols and their evolution in the eastern North Atlantic
[AD-A275011] p 3377 N94-29128
Activities report of the International Meteorological Institute
[ETN-94-95524] p 3370 N94-29423
Optical modeling of visibility and visibility instrumentation using stratified Mie theory p 3348 N94-29750
Micro-sensors for in-situ meteorological measurements p 3236 N94-29777
Brief summary of accomplishments since our DOE-sponsored radon project commenced
[DE94-004643] p 3348 N94-29926
Granulometry in environments with very small particle concentrations p 3259 N94-30511
Cloud and aerosol characterization for the ARM central facility: Multiple remote sensor techniques development
[DE94-003523] p 3365 N94-30608
Radiation transport in cloudy and aerosol loaded atmospheres p 3366 N94-30805
Using the log-normal distribution in analyzing aerosols: The mathematical reasoning underlying the various diameters used and the plotting procedure
[DE94-006459] p 3461 N94-30817
The long-range transport of aerosol particles over the North Atlantic Ocean p 3366 N94-30867

AEROSPACE ENGINEERING
Aerospace Software Engineering for Advanced Systems Architectures
[AGARD-CP-545] p 3412 N94-29315
Lubrication of space systems
[NASA-TM-106392] p 3214 N94-29399
The 27th Aerospace Mechanisms Symposium
[NASA-CP-3205] p 3160 N94-29627
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 23: The communications practices of US aerospace engineering faculty and students: Results of the phase 3 survey
[NASA-TM-109085] p 3534 N94-30149
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 22: US academic librarians and technical information specialists as information intermediaries: Results of the phase 3 survey
[NASA-TM-109067] p 3534 N94-30150

AEROSPACE ENVIRONMENTS
Japanese Journal of Aerospace and Environmental Medicine, vol. 30, no. 3
[JTN-94-80606] p 3387 N94-28495
Some issues on Japan's space food development and relating preliminary experimental study p 3388 N94-28498
Fluid and transportation phenomena under microgravity p 3227 N94-28939
Glass studies under microgravity p 3228 N94-28941
Fabrication of electronic materials in space p 3228 N94-28942
Protein crystal growth in microgravity p 3228 N94-28943
Cell culture in space p 3228 N94-28944
Cosmic energy equipment p 3229 N94-28945

AEROSPACE INDUSTRY
Retention latch mechanism for the Wake Shield Facility p 3161 N94-29635
Confessions of a robot lobotomist
[AIAA PAPER 94-1185-CP] p 3440 N94-30535
Graphical simulation for aerospace manufacturing
[AIAA PAPER 94-1224-CP] p 3446 N94-30573

AEROSPACE MEDICINE
The Support of Air Operations under Extreme Hot and Cold Weather Conditions
[AGARD-CP-540] p 3379 N94-28420
The concept of Royal Navy air operations under extreme environmental conditions p 3379 N94-28424
Aeromedical support for casualties in extremely hot climates p 3382 N94-28443
Work conditions assessment in pilots and ground personnel under high weather temperatures p 3382 N94-28444
Test of a new protection suit in a climatic chamber p 3384 N94-28452
Japanese Journal of Aerospace and Environmental Medicine, vol. 30, no. 3
[JTN-94-80606] p 3387 N94-28495
The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight
[JTN-94-80588] p 3392 N94-29709
Hemodynamic measurement during parabolic flight p 3393 N94-29717
Motion sickness in parabolic flight: Possibility of electrogastrography as an objective index p 3393 N94-29718
Shortening velocity and calcium sensitivity of single fibers from hindlimb suspended muscle in rats p 3387 N94-29866

AEROSPACE PLANES
Numerical simulation of supersonic flow around space plane with engine installed p 3125 N94-28961
Some problems of scramjet propulsion for aerospace planes. Part 1: Scramjet: Aims and features p 3151 N94-29295
Some problems of scramjet propulsion for aerospace planes. Part 2: Scramjet: Development and test problems p 3152 N94-29301

AEROSPACE SAFETY
Second NASA Workshop on Wiring for Space Applications
[NASA-CP-3244] p 3165 N94-28697
NASA wiring program: Survey of NASA experiences in wiring system safety p 3165 N94-28700
Wire insulation degradation and flammability in low gravity p 3166 N94-28712
Vulnerability of manned spacecraft to crew loss from orbital debris penetration
[NASA-TM-108452] p 3169 N94-30161

AEROSPACE SYSTEMS
Second NASA Workshop on Wiring for Space Applications
[NASA-CP-3244] p 3165 N94-28697
Wiring for space applications program p 3166 N94-28708
High temperature arc-track resistant aerospace insulation p 3167 N94-28716
General theory and algorithms for the non-casual inversion, slewing and control of space-based articulated structures
[AD-A275118] p 3167 N94-29002
A generalization of the software engineering maturity model p 3416 N94-29341
Lubrication of space systems
[NASA-TM-106392] p 3214 N94-29399
Integration of pyrotechnics into aerospace systems p 3161 N94-29634
Advanced vehicle concepts systems and design analysis studies
[NASA-CR-195115] p 3147 N94-29721
Proceedings of the Workshop on Microtechnologies and Applications to Space Systems
[NASA-CR-195688] p 3235 N94-29767
The application of micromachined sensors to manned space systems p 3171 N94-29791
A study of the flexible space platform based deployable manipulator
[ISBN-0-315-85410-3] p 3303 N94-30135
Object-based task-level control: A hierarchical control architecture for remote operation of space robots
[AIAA PAPER 94-1209-CP] p 3444 N94-30560
An intelligent robot for helping astronauts
[AIAA PAPER 94-1233-CP] p 3447 N94-30581
Dual cure low-VOC coating process, phase 3
[DE94-003202] p 3221 N94-30826

AEROSPACE TECHNOLOGY TRANSFER
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 23: The communications practices of US aerospace engineering faculty and students: Results of the phase 3 survey
[NASA-TM-109085] p 3534 N94-30149
NASA/DOD Aerospace Knowledge Diffusion Research Project. Report 22: US academic librarians and technical information specialists as information intermediaries: Results of the phase 3 survey
[NASA-TM-109067] p 3534 N94-30150
Terrestrial applications of NASA space telerobotics technologies
[AIAA PAPER 94-1235-CP] p 3448 N94-30582

AEROSPACE VEHICLES
Second NASA Workshop on Wiring for Space Applications
[NASA-CP-3244] p 3165 N94-28697
NASA wiring program: Survey of NASA experiences in wiring system safety p 3165 N94-28700
Variable soft sphere molecular model in the Monte Carlo simulation of air species p 3123 N94-28949
Rarefied gas numerical wind tunnel. Part 8: HOPE p 3123 N94-28950
Numerical simulation of aerothermodynamic heating of hypersonic space transportation vehicles p 3124 N94-28955
Code development for hypersonic real-gas flow simulations toward the design of space vehicles, part 2 p 3125 N94-28966
Review of sonic fatigue technology
[NASA-CR-4587] p 3479 N94-29407

AEROTHERMOCHEMISTRY
Numerical simulation of arc heated wind tunnel flow p 3123 N94-28951
Aerothermochemical calculations in afterburners p 3154 N94-29258
Models for vibration-dissociation coupling in high-temperature gases p 3273 N94-29675
A study of low emissions gas turbine combustions
[NASA-CR-195763] p 3152 N94-29860

AEROTHERMODYNAMICS
Ducted kerosene spray flames p 3195 N94-29276

AFTERBURNING
Aerothermochemical calculations in afterburners p 3154 N94-29258
Technology rigs: A tool for afterburner development p 3154 N94-29270

AGING (BIOLOGY)
Aviation epidemiology data register: Age distribution of U.S. Army aviators stratified by gender and component of service
[AD-A275901] p 3388 N94-28757

AGING (MATERIALS)
Aircraft age impacts on maintenance requirements
[AD-A275701] p 3121 N94-28666
Correlation between wet ageing, humidity absorption and properties on composite materials based on different resins family
[REPT-932-600-107] p 3179 N94-29462
Effects of physical aging on long-term creep of polymers and polymer matrix composites
[NASA-TM-109081] p 3181 N94-29541
The effect of temperature on creep and physical ageing of PVC
[NPL-DMM(A)-93] p 3217 N94-29885
Creep and physical aging of PVC: Dependence on stress and temperature
[NPL-DMM(A)-115] p 3217 N94-29886
Novel techniques applied to polymer lifetime predictions
[DE94-005095] p 3218 N94-30102

AGING (METALLURGY)
Low temperature behavior of virgin martensite
[PB94-132925] p 3204 N94-29142

AGREEMENTS
Protocol on environmental protection to the Antarctic Treaty and its annexes: International agreement on the comprehensive measures for the protection of Antarctic environment and ecosystems p 3354 N94-29086

AGRICULTURE
JERS-1 and future remote sensing: Application of remote sensing data to agroecological problems p 3331 N94-29229

AIR BREATHING ENGINES
Research and development of ramjets/ramrockets. Part 1: Integral solid propellant ramrockets p 3151 N94-29294

AIR CONDITIONING
Experimental evaluation of two systems of individual air-conditioning p 3384 N94-28450
ARTI Refrigerant Database [DE94-004906] p 3230 N94-28563
Ventilation cost and air cleaning p 3232 N94-29605
Control of heating, ventilation and air conditioning (HVAC) systems [PB94-138807] p 3401 N94-30000
Using spacecraft trace contaminant control systems to cure sick building syndrome p 3354 N94-30470

AIR CONDITIONING EQUIPMENT
The use of liquid and air microclimate conditioning systems to alleviate heat stress in helicopter NBC operations p 3384 N94-28453
Ventilation cost and air cleaning p 3232 N94-29605
Control of heating, ventilation and air conditioning (HVAC) systems [PB94-138807] p 3401 N94-30000

AIR COOLING
The use of liquid and air microclimate conditioning systems to alleviate heat stress in helicopter NBC operations p 3384 N94-28453
Acquisition, design modification, assembly, and ground test of NPS Hummingbird remotely piloted helicopter [AD-A275546] p 3146 N94-28837
Chambers of turboreactors with variable geometry: A response to the matrix of pollution in cycles at high temperature, high pressure p 3194 N94-29273

AIR CURRENTS
Objective analysis of a coastal ocean eddy using satellite AVHRR and in situ hydrographic data [AD-A275715] p 3376 N94-28642
A laboratory simulation of urban heat-island-induced circulation in a stratified environment p 3367 N94-30921

AIR CUSHION LANDING SYSTEMS
An evaluation of personality testing and the five-factor model in the selection of landing craft air cushion vehicle crew members [AD-A275869] p 3397 N94-28754

AIR DEFENSE
Synchronization, positioning, and communication in multistatic radar systems for air defence [PB94-137478] p 3243 N94-28908

AIR DROP OPERATIONS
Air-depioyable geophysics package [DE94-005651] p 3335 N94-30594

AIR FILTERS
Using spacecraft trace contaminant control systems to cure sick building syndrome p 3354 N94-30470

AIR FLOW
Papers in meteorology and geophysics, vol. 44, no.1 [JTN-94-80585] p 3324 N94-28693
On the linear stability of Verkley's modons p 3324 N94-28695
Structure of neutrally stratified turbulent Ekman layer as predicted by closure models with prognostic equation for master length scale p 3325 N94-28696
Evaluation of the transient operation of advanced gas turbine combustors p 3154 N94-29269
Chambers of turboreactors with variable geometry: A response to the matrix of pollution in cycles at high temperature, high pressure p 3194 N94-29273
The influence of air distribution on homogeneity and pollutant formation in the primary zone of a tubular combustor p 3194 N94-29274
Advanced Design of Ventilation Systems [VKI-LS-1993-07] p 3231 N94-29598
Introduction to the design of ventilation systems p 3231 N94-29599
Ventilation systems p 3232 N94-29601
Theory of age distribution p 3232 N94-29602
Computational fluid dynamics in ventilation. 1: Theory and one-dimensional test case p 3232 N94-29606
Computational fluid dynamics in ventilation. 2: Theory and codes p 3233 N94-29607
Computational fluid dynamics in ventilation. 3: The IEA annex 20 work p 3233 N94-29608
Computational fluid dynamics in ventilation. 4: Commercial application of CFD in ventilation p 3233 N94-29609
Computational fluid dynamics in ventilation. 5: New developments in CFD with relevance to ventilation p 3233 N94-29610
Computational fluid dynamics in ventilation: Practical approach p 3233 N94-29611

AIR JETS
The mixing process in the quenching zone of the rich-lean-combustion concept p 3196 N94-29281
Temperature and combustion analysis of combustor with acoustically controlled primary zone air-jet mixing p 3196 N94-29284
Computational fluid dynamics in ventilation. 5: New developments in CFD with relevance to ventilation p 3233 N94-29610

AIR LAND INTERACTIONS
On eddy accumulation with limited conditional sampling to measure air-surface exchange [DE94-005112] p 3368 N94-28568
Modeling the Earth System, volume 3 [NASA-CR-194256] p 3350 N94-30616
Atmosphere, ocean, and land: Critical gaps in Earth system models p 3350 N94-30617
Land surface interaction p 3350 N94-30621
A toy model for estimating N2O emissions from natural soils p 3351 N94-30627
A bottom-up evolution of terrestrial ecosystem modeling theory, and ideas toward global vegetation modeling p 3351 N94-30628
A laboratory simulation of urban heat-island-induced circulation in a stratified environment p 3367 N94-30921

AIR NAVIGATION
Object oriented design of the autonomous fixtaking management system p 3143 N94-29323
Ground independent landing system p 3137 N94-29564
GPS/GNSS for ATM p 3138 N94-29565
Simulation of fully automated air traffic control concepts p 3139 N94-29569
Interactive analysis and planning tools for air traffic and airspace management p 3139 N94-29573
ARC2000: Automatic radar control p 3141 N94-29583

AIR POLLUTION
Measurement of volatile metal species at elevated temperatures [PB94-132321] p 3186 N94-28407
Development of the integrated environmental control model: Performance models of selective catalytic reduction NO(x) control systems [DE94-002151] p 3341 N94-28465
An improved method of measuring tropospheric NO2, NO3, HO2, and RO2 by Matrix Isolation and Electronic Spin Resonance (MIESR) p 3345 N94-28605
Feasibility study on introduction of a large methanol engine power generation plant [DE94-732338] p 3224 N94-28629
Studies of marine aerosols and their evolution in the eastern North Atlantic [AD-A275011] p 3377 N94-29128
Characterization of air emissions from the simulated open combustion of fiberglass materials [PB94-136231] p 3347 N94-29192
On the effect of emissions from aircraft engines on the state of the atmosphere p 3189 N94-29247
Pollutant emissions from and within a model gas turbine combustor at elevated pressures and temperatures p 3194 N94-29271
Reduction of NO(x) by fuel-staging in gas turbine engines: A commitment to the future p 3194 N94-29272
The influence of air distribution on homogeneity and pollutant formation in the primary zone of a tubular combustor p 3194 N94-29274
Introduction to the design of ventilation systems p 3231 N94-29599
The suitability of low-cost urban airshed modeling in the Chicago area [DE94-005114] p 3349 N94-30023
Intermedia transfer factors for fifteen toxic pollutants released to air basins in California [DE94-005699] p 3349 N94-30044
Novel mass spectrometric instrument for gaseous and particulate characterization and monitoring [DE94-005896] p 3349 N94-30047
Granulometry in environments with very small particle concentrations p 3259 N94-30511
An evaluation of explicit pseudo-steady-state approximation schemes for stiff ODE systems from chemical kinetics [CWI-NM-R9312] p 3353 N94-30729

AIR PURIFICATION
Using spacecraft trace contaminant control systems to cure sick building syndrome p 3354 N94-30470

AIR QUALITY
Advanced Design of Ventilation Systems [VKI-LS-1993-07] p 3231 N94-29598
Human requirements to the indoor air quality and the thermal environment p 3232 N94-29600
Computational fluid dynamics in ventilation: Practical approach p 3233 N94-29611
The suitability of low-cost urban airshed modeling in the Chicago area [DE94-005114] p 3349 N94-30023
Using spacecraft trace contaminant control systems to cure sick building syndrome p 3354 N94-30470
Fuel cycle evaluations of biomass-ethanol and reformulated gasoline [DE94-000227] p 3226 N94-30818

AIR SAMPLING
Measurement of volatile metal species at elevated temperatures [PB94-132321] p 3186 N94-28407
On eddy accumulation with limited conditional sampling to measure air-surface exchange [DE94-005112] p 3368 N94-28568
Tropospheric HO determination by FAGE p 3342 N94-28590
The active titration method for measuring local hydroxyl radical concentration p 3345 N94-28602
An improved method of measuring tropospheric NO2, NO3, HO2, and RO2 by Matrix Isolation and Electronic Spin Resonance (MIESR) p 3345 N94-28605
Tropospheric HO2 determination by FAGE p 3345 N94-28606
HO2 detection by near infrared absorption using tunable diode lasers p 3346 N94-28608
Properties of adsorbents for collection and analysis of trace amount of chlorofluorocarbons in air p 3188 N94-28680
A study of low emissions gas turbine combustions [NASA-CR-195763] p 3152 N94-29860
The long-range transport of aerosol particles over the North Atlantic Ocean p 3366 N94-30867

AIR SEA ICE INTERACTIONS
Antarctic Record, volume 36, no. 1 [REPT-106-VOL-36-NO-1] p 3357 N94-29078
Activities of the wintering party at Showa Station by the 31st Japanese Antarctic Research Expedition in 1990 p 3358 N94-29083
A toy model of sea ice growth p 3351 N94-30626
Cryosphere and climate p 3352 N94-30632

AIR TRAFFIC
Machine Intelligence in Air Traffic Management [AGARD-CP-538] p 3136 N94-29558
Ground independent landing system p 3137 N94-29564
GPS/GNSS for ATM p 3138 N94-29565
Contributions of DLR to air traffic capacity enhancement within a terminal area p 3138 N94-29567
Simulation of fully automated air traffic control concepts p 3139 N94-29569
DLR's ATM demonstration programme p 3140 N94-29575

AIR TRAFFIC CONTROL
Machine Intelligence in Air Traffic Management [AGARD-CP-538] p 3136 N94-29558
Advances in development capabilities for intelligent air traffic management systems p 3137 N94-29559
Intelligent systems for air space control and management p 3137 N94-29560
Use of advanced technologies in ATM (air traffic management) domain p 3137 N94-29561
Air traffic management as principled negotiation between intelligent agents p 3137 N94-29562
Use of GPS in automated air traffic control p 3137 N94-29563
Ground independent landing system p 3137 N94-29564
GPS/GNSS for ATM p 3138 N94-29565
ACCS Surveillance Exploratory Prototype (ASEP) p 3138 N94-29566
Contributions of DLR to air traffic capacity enhancement within a terminal area p 3138 N94-29567
Design of Center-TRACON Automation System p 3138 N94-29568
Simulation of fully automated air traffic control concepts p 3139 N94-29569
Decision Making Aids (DMA) in on-line ATC systems p 3139 N94-29570
Cognitive approach to specifications on air traffic controllers' decision assistance systems p 3139 N94-29571
Considerations on graphical user interfaces for intelligent ATM support systems p 3139 N94-29572
Interactive analysis and planning tools for air traffic and airspace management p 3139 N94-29573
DAISY: A decision aid for an air situation interpretation system p 3139 N94-29574
DLR's ATM demonstration programme p 3140 N94-29575
Advanced air traffic control and flight management system concepts p 3140 N94-29576
Opportunities for integrating the aircraft FMS, aeronautical operational control centers, and future air traffic management systems in oceanic airspace p 3140 N94-29577
Profile negotiation: An air/ground automation integration concept for managing arrival traffic p 3140 N94-29578

Air-ground integration of the ATM system in PHARE p 3141 N94-29579
Experimental flight management system p 3141 N94-29580
The PHARE advanced tools p 3141 N94-29581
The Common Modular Simulator (CMS): An architecture test bed for future advanced ATM systems p 3141 N94-29582
ARC2000: Automatic radar control p 3141 N94-29583
A novel near-range radar network for airport surface control p 3142 N94-29586
Development of precision runway monitor system for increasing capacity of parallel runway operations p 3142 N94-29587
Scanning and monitoring performance: Effects of the reinforcement values of the events being monitored [DOT/FAA/AM-94/8] p 3398 N94-29918
Installation of experimental mode-S data link in commercial aircraft [PB94-136757] p 3254 N94-29998
A simulator for multi-radar analysis for realistic traffic [AD-B179099] p 3142 N94-30439
A stochastic control approach to flight path monitoring [AD-B174630] p 3143 N94-30853
Maintaining vigilance on a simulated ATC monitoring task across repeated sessions [DOT/FAA/AM-94/6] p 3143 N94-30933
The experimental flight management system: An air traffic management research tool [NLR-TP-92253-U] p 3143 N94-30943

AIR TRAFFIC CONTROLLERS (PERSONNEL)
Decision Making Aids (DMA) in on-line ATC systems p 3139 N94-29570
Cognitive approach to specifications on air traffic controllers' decision assistance systems p 3139 N94-29571
Considerations on graphical user interfaces for intelligent ATM support systems p 3139 N94-29572
Interactive analysis and planning tools for air traffic and airspace management p 3139 N94-29573
DAISY: A decision aid for an air situation interpretation system p 3139 N94-29574
Scanning and monitoring performance: Effects of the reinforcement values of the events being monitored [DOT/FAA/AM-94/8] p 3398 N94-29918
Maintaining vigilance on a simulated ATC monitoring task across repeated sessions [DOT/FAA/AM-94/6] p 3143 N94-30933

AIR TRANSPORTATION
National Transportation Safety Board annual review of aircraft accident data. US general aviation, 1990 [PB94-126869] p 3135 N94-29185
A capacity planning model for Canadian military airlift requests [ISBN-0-315-86079-0] p 3136 N94-30144

AIR WATER INTERACTIONS
Research trends on remote sensing at research facilities in Japan: The priority area programme on better understanding of earth environment via satellite p 3326 N94-28928
SAR-related stress variability in the Marine Atmospheric Boundary Layer (MABL) [AD-A275275] p 3377 N94-29436
The dynamics of tropical intraseasonal variability p 3371 N94-29741
On the annual cycle of the tropical Pacific atmosphere and ocean p 3371 N94-29763
Modeling the Earth System, volume 3 [NASA-CR-194256] p 3350 N94-30616
Atmosphere, ocean, and land: Critical gaps in Earth system models p 3350 N94-30617
Ocean-atmospheric linkages p 3350 N94-30623
Four simple ocean carbon models p 3351 N94-30625
Studies of interfaces and vapors with Optical Second Harmonic Generation [DE94-006295] p 3476 N94-30841
The long-range transport of aerosol particles over the North Atlantic Ocean p 3366 N94-30867

AIRBORNE RADAR
Ground independent landing system p 3137 N94-29564

AIRBORNE/SPACEBORNE COMPUTERS
Software engineering methods in the Hermes on-board software p 3414 N94-29326
Ada run time system certification for avionics applications p 3150 N94-29332
On ground system integration and testing: A modern approach p 3150 N94-29334
Testing Operational Flight Programs (OFPs) p 3415 N94-29337
Future manned systems advanced avionics study [NASA-CR-188277] p 3150 N94-29377

AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident/incident summary report: In-flight loss of control, leading to forced landing and runway overrun, Continental Express, Inc., N24706 Embraer EMB-120 RT, Pine Bluff, Arkansas, 29 April 1993 [PB94-910404] p 3135 N94-29402

AIRCRAFT ACCIDENTS
Physiological investigations of the isolated rat's liver in hypothermia and hypoxia and their relevance in aircraft incidents above the sea p 3382 N94-28439
Crashworthiness analysis of commuter aircraft seats [AD-A275889] p 3135 N94-28799
National Transportation Safety Board annual review of aircraft accident data. US general aviation, 1990 [PB94-126869] p 3135 N94-29185
Fire behavior of aeronautical materials [REPT-932-600-105] p 3197 N94-29457

AIRCRAFT APPROACH SPACING
Contributions of DLR to air traffic capacity enhancement within a terminal area p 3138 N94-29567
Design of Center-TRACON Automation System p 3138 N94-29568
Profile negotiation: An air/ground automation integration concept for managing arrival traffic p 3140 N94-29578
ARC2000: Automatic radar control p 3141 N94-29583
Development of precision runway monitor system for increasing capacity of parallel runway operations p 3142 N94-29587

AIRCRAFT COMPARTMENTS
Aircraft evacuations: The effect of a cabin water spray system upon evacuation rates and behaviour [CAA-PAPER-93008] p 3148 N94-29887

AIRCRAFT CONFIGURATIONS
Three-dimensional external flow computations using prismatic grid p 3127 N94-28979
Expanding the waverider design space using arbitrary generating flowfields p 3148 N94-30516
Nonlinear multibody formulation for rotorcraft analysis p 3149 N94-30787
Aerodynamic analysis of slipstream/wing/nacelle interference for preliminary design of aircraft configurations [AD-B173651] p 3135 N94-30916

AIRCRAFT CONSTRUCTION MATERIALS
Service life prediction of composite structures through fiber testing [AD-A275661] p 3176 N94-28654
Full-scale testing and analysis of curved aircraft fuselage panels [AD-A275666] p 3145 N94-28657
NAVAIR aircraft wiring standardization and qualification program p 3166 N94-28704
Role of microstructure on the fatigue durability of aluminum aircraft alloys [AD-A275814] p 3202 N94-28830
Fire behavior of aeronautical materials [REPT-932-600-105] p 3197 N94-29457
Rules and definition of the range of paints applied on aeronautical structrural composites [REPT-932-600-106] p 3215 N94-29459
The machining of fiber metal laminates. Part 1: An inventory of forming processes [LR-710-PT-1] p 3184 N94-30343
Composite hot drape forming p 3240 N94-30448

AIRCRAFT CONTROL
An experimental and theoretical study of the aerodynamic characteristics of some generic missile concepts at Mach numbers from 2 to 6.8 [NASA-TM-109110] p 3130 N94-29473
Opportunities for integrating the aircraft FMS, aeronautical operational control centers, and future air traffic management systems in oceanic airspace p 3140 N94-29577
Decoupled flight control system design using the singular perturbation method p 3155 N94-29850
Payload central control for unmanned aircraft p 3155 N94-30284

AIRCRAFT DESIGN
Organized wiring systems p 3166 N94-28705
Modification of ACSYNT aircraft computer program for preliminary design [NASA-CR-195737] p 3145 N94-28817
Exploring QDES as a tool for determining limits of achievable performance in aircraft design [AD-A275359] p 3146 N94-28998
Information presentation for expert systems in future fighter aircraft [AD-A275126] p 3149 N94-29005
Spray combustion experiments and numerical predictions p 3195 N94-29277
Low-speed longitudinal aerodynamic characteristics of a flat-plate planform model of an advanced fighter configuration [NASA-TM-109045] p 3130 N94-29443

AIRCRAFT ENGINES
Fuels and Combustion Technology for Advanced Aircraft Engines [AGARD-CP-536] p 3189 N94-29246
On the effect of emissions from aircraft engines on the state of the atmosphere p 3189 N94-29247
Combustion technology needs for advanced high pressure cycle engines p 3190 N94-29248
Combustion for future supersonic transport propulsion p 3190 N94-29249
Flowfield prediction of NO(x) and smoke production in aircraft engines p 3191 N94-29252
High temperature fuel requirements and payoffs p 3192 N94-29259
Design aspects in small aircraft gas turbine fuel injectors p 3154 N94-29264
Technology rigs: A tool for afterburner development p 3154 N94-29270
Reduction of NO(x) by fuel-staging in gas turbine engines: A commitment to the future p 3194 N94-29272
The influence of air distribution on homogeneity and pollutant formation in the primary zone of a tubular combustor p 3194 N94-29274
Effects of hydrogen addition on pollutant emissions in a gas turbine combustor p 3195 N94-29275
Ducted kerosene spray flames p 3195 N94-29276
Spray combustion experiments and numerical predictions p 3195 N94-29277
Some problems of scramjet propulsion for aerospace planes. Part 2: Scramjet: Development and test problems p 3152 N94-29301
Automated inspection of turbine blades: Challenges and opportunities [AIAA PAPER 94-1226-CP] p 3446 N94-30575

AIRCRAFT EQUIPMENT
Thermal strain generated by an enhanced anti-G protection system in a hot climate p 3383 N94-28445
Cockpit video: A low cost BDA source [AD-A275228] p 3150 N94-29389

AIRCRAFT FUELS
Advanced fuel properties: A computer program for estimating property values [AD-A275248] p 3224 N94-28901
Fuels combustion research [AD-A275122] p 3189 N94-29004
Fuels and Combustion Technology for Advanced Aircraft Engines [AGARD-CP-536] p 3189 N94-29246
High temperature resistant jet fuels p 3192 N94-29260

AIRCRAFT GUIDANCE
Opportunities for integrating the aircraft FMS, aeronautical operational control centers, and future air traffic management systems in oceanic airspace p 3140 N94-29577
Profile negotiation: An air/ground automation integration concept for managing arrival traffic p 3140 N94-29578
Air-ground integration of the ATM system in PHARE p 3141 N94-29579
Experimental flight management system p 3141 N94-29580
The PHARE advanced tools p 3141 N94-29581
Automatic control steps for aircraft taxi guidance p 3141 N94-29584
A novel near-range radar network for airport surface control p 3142 N94-29586
Development of precision runway monitor system for increasing capacity of parallel runway operations p 3142 N94-29587
A stochastic control approach to flight path monitoring [AD-B174630] p 3143 N94-30853
Flight simulator evaluation of advanced MLS procedures [AD-B174270] p 3143 N94-30915

AIRCRAFT ICING
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion p 3130 N94-29674
The 3-D LDV measurements on a 30-degree swept wing with a simulated ice accretion [NASA-CR-195327] p 3132 N94-30124
An experimental study of the aerodynamics of a swept and unswept semispan wing with a simulated glaze ice accretion [NASA-CR-195330] p 3133 N94-30152
Test of prototype liquid-water-content meter for aircraft use [NASA-CR-189304] p 3374 N94-30187
Remote sensor observations during WISP91: The use of microwave radiometers, RASS, and lidar ceilometers for detection of aircraft icing conditions [PB94-142106] p 3136 N94-30890

AIRCRAFT INDUSTRY
Fishermans Bend: A centre of Australian aviation
[AD-A274981] p 3121 N94-29090
AIRCRAFT INSTRUMENTS
GPS/GNSS for ATM p 3138 N94-29565
Installation of experimental mode-S data link in commercial aircraft
[PB94-138757] p 3254 N94-29998
Test of prototype liquid-water-content meter for aircraft use
[NASA-CR-189304] p 3374 N94-30187
AIRCRAFT MAINTENANCE
Effects of repair on structural integrity
[AD-A275756] p 3145 N94-28647
Aircraft age impacts on maintenance requirements
[AD-A275701] p 3121 N94-28666
Organized wiring systems p 3166 N94-28705
Aircraft age impact on individual operating and support cost elements
[AD-A275739] p 3121 N94-28732
Evaluation of access/navigational features of a graphical-user interface installed on a portable maintenance aid
[AD-A275791] p 3136 N94-28744
Role of microstructure on the fatigue durability of aluminum aircraft alloys
[AD-A275814] p 3202 N94-28830
A time reasoning system based on the event calculus for scheduling in aeronautic maintenance
[REPT-932-710-101] p 3122 N94-29463
The effect of mechanical paint stripping on the fatigue and fracture of thin aluminum airplane skin
p 3205 N94-29900
The Automated Aircraft Rework System (AARS): A system integration approach
[AIAA PAPER 94-1225-CP] p 3446 N94-30574
AIRCRAFT MODELS
Modification of ACSYNT aircraft computer program for preliminary design
[NASA-CR-195737] p 3145 N94-28817
A non-linear simulation for an autonomous unmanned air vehicle
[AD-A275062] p 3146 N94-29200
Miniature linear-to-rotary motion actuator
p 3163 N94-29647
Sensitivity analysis of the static aeroelastic response of a wing p 3134 N94-30525
AIRCRAFT NOISE
Experimental validation of finite element and boundary element methods for predicting structural vibration and radiated noise
[NASA-CR-4561] p 3301 N94-29552
AIRCRAFT PERFORMANCE
Exploring QDES as a tool for determining limits of achievable performance in aircraft design
[AD-A275359] p 3146 N94-28998
AIRCRAFT PILOTS
Effects of repair on structural integrity
[AD-A275756] p 3145 N94-28647
Naval aviation vision standards research at the naval aerospace medical research laboratory: The long view
[AD-A275885] p 3388 N94-28756
Aviation epidemiology data register: Age distribution of U.S. Army aviators stratified by gender and component of service
[AD-A275901] p 3388 N94-28757
Disturbance of equilibrium on JAL flight crew
p 3390 N94-28856
AIRCRAFT PRODUCTION
Fishermans Bend: A centre of Australian aviation
[AD-A274981] p 3121 N94-29090
AIRCRAFT RELIABILITY
Automation for nondestructive inspection of aircraft
[AIAA PAPER 94-1223-CP] p 3446 N94-30572
AIRCRAFT SAFETY
Full-scale testing and analysis of curved aircraft fuselage panels
[AD-A275666] p 3145 N94-28657
Crashworthiness analysis of commuter aircraft seats
[AD-A275889] p 3135 N94-28799
National Transportation Safety Board annual review of aircraft accident data. US general aviation, 1990
[PB94-126869] p 3135 N94-29185
Fire behavior of aeronautical materials
[REPT-932-600-105] p 3197 N94-29457
Aircraft evacuations: The effect of a cabin water spray system upon evacuation rates and behaviour
[CAA-PAPER-93008] p 3148 N94-29887
Remote sensor observations during WISP91: The use of microwave radiometers, RASS, and lidar ceilometers for detection of aircraft icing conditions
[PB94-142106] p 3136 N94-30890
Analysis concerning the inspection threshold for multi-site damage
[PB94-142429] p 3149 N94-30905
AIRCRAFT STRUCTURES
Development of Alternating Current Potential Drop (ACPD) procedures for crack detection in aluminum aircraft panels
[AD-A275755] p 3315 N94-28646
Effects of repair on structural integrity
[AD-A275756] p 3145 N94-28647
Full-scale testing and analysis of curved aircraft fuselage panels
[AD-A275666] p 3145 N94-28657
A moment plotting method for characterizing aircraft fatigue data population distributions
[AD-A275500] p 3145 N94-28660
Crashworthiness analysis of commuter aircraft seats
[AD-A275889] p 3135 N94-28799
Fuels combustion research
[AD-A275122] p 3189 N94-29004
Backscatter haze device for measurement of haze in aircraft transparencies
[AD-A275127] p 3146 N94-29042
Cold expansion and interference for extending the fatigue life of multi-layer metal joints
[AD-A274982] p 3318 N94-29091
Review of sonic fatigue technology
[NASA-CR-4587] p 3479 N94-29407
Automation of the NDT diagnostic using neural nets. Application: Inspection of Airbus longitudinal joints during maintenance
[REPT-932-600-104] p 3315 N94-29474
Dual-Band Infrared (DBIR) imaging inspections of Boeing 737 and KC-135 aircraft panels
[DE94-005700] p 3122 N94-29842
Dynamic fracture mechanics analysis for an edge delamination crack
[NASA-TM-109106] p 3479 N94-29856
Rotorcraft airframe structural optimization for vibration and dynamic stress reduction including damping treatment p 3147 N94-29878
Acoustic emission monitoring of aging aircraft structures
[DREP-93-17] p 3148 N94-30129
Enhanced fatigue crack detection in aging aircraft using continuous acoustic emission monitoring
[DREP-93-16] p 3148 N94-30131
Automation for nondestructive inspection of aircraft
[AIAA PAPER 94-1223-CP] p 3446 N94-30572
Dual-band infrared imaging for quantitative corrosion detection in aging aircraft
[DE94-004187] p 3149 N94-30687
Prospects of time-linearized unsteady calculation methods for exponentially diverging motions in aeroelasticity
[PB94-126224] p 3134 N94-30740
Analysis concerning the inspection threshold for multi-site damage
[PB94-142429] p 3149 N94-30905
AIRFIELD SURFACE MOVEMENTS
Automatic control steps for aircraft taxi guidance
p 3141 N94-29584
Airside ground movements surveillance
p 3141 N94-29585
A novel near-range radar network for airport surface control p 3142 N94-29586
AIRFOIL PROFILES
A design of third-generation airfoils for helicopter rotor blades using Navier-Stokes p 3124 N94-28957
Numerical analysis of airfoil for helicopter blade at high angle of attack using Navier-Stokes code
p 3124 N94-28958
Unsteady aerodynamic computations around NACA0012 at high angles of attack
p 3126 N94-28969
Application of digital control theory to adaptive grid generation p 3127 N94-28980
Helicopter mission and rotor performance optimization with quasi-linear inflow theory p 3147 N94-29594
A residual correction method applied to 2D multi-point airfoil design and 3D single-point wing design
[NLR-TP-92524-U] p 3134 N94-30493
Hopf bifurcation in viscous, low-speed flows about an airfoil with structural coupling p 3134 N94-30865
AIRFOILS
Aerodynamic design using parallel processors
[AD-A275470] p 3122 N94-28674
Proceedings of the 10th NAL Symposium on Aircraft Computational Aerodynamics
[NAL-SP-19] p 3123 N94-28946
Application of flow field simulation to turbine vane design p 3127 N94-28978
Time-marching aeroelastic and spatial adaptation procedures on triangular and tetrahedral meshes using an unstructured-grid Euler method p 3131 N94-29877
Calculus of variations applied to 2D multi-point airfoil design
[PB94-125457] p 3133 N94-30401
A residual correction method applied to 2D multi-point airfoil design and 3D single-point wing design
[NLR-TP-92524-U] p 3134 N94-30493
Euler results of the ISNaS compressible multi-block flow solver
[AD-B179299] p 3281 N94-30756
Grid adaption in computational aerodynamics
[PB94-126240] p 3134 N94-30858
AIRFRAMES
An analytical study of unsteady rotor/fuselage interaction in hover and forward flight
p 3131 N94-29826
Integrated propulsion-airframe dynamics and control
p 3147 N94-29854
Rotorcraft airframe structural optimization for vibration and dynamic stress reduction including damping treatment p 3147 N94-29878
Fatigue management and verification of airframes
[FFA-TN-1993-55] p 3149 N94-30947
AIRGLOW
Solar measurements from the Airglow-Solar Spectrometer Instrument (ASSI) on the San Marco 5 satellite
[NASA-CR-193815] p 3551 N94-30948
AIRLINE OPERATIONS
Effects of repair on structural integrity
[AD-A275756] p 3145 N94-28647
Design of Center-TRACON Automation System
p 3138 N94-29568
DLR's ATM demonstration programme
p 3140 N94-29575
AIRPORTS
Los Angeles international airport instrument landing system approach data collection and reduction, phase 1
[AD-A275115] p 3136 N94-28914
Contributions of DLR to air traffic capacity enhancement within a terminal area p 3138 N94-29567
Design of Center-TRACON Automation System
p 3138 N94-29568
DLR's ATM demonstration programme
p 3140 N94-29575
Development of precision runway monitor system for increasing capacity of parallel runway operations
p 3142 N94-29587
AIRSPACE
Contributions of DLR to air traffic capacity enhancement within a terminal area p 3138 N94-29567
Interactive analysis and planning tools for air traffic and airspace management p 3139 N94-29573
ALASKA
A coupled approach to spatially derived parameters necessary for ecosystem modeling on the North Slope of Alaska: Appendix A
[DE94-005853] p 3349 N94-30046
Assessment of costs and benefits of flexible and alternative fuel use in the US transportation sector
[DE94-006100] p 3226 N94-30885
ALBEDO
GCM studies of the influence of vegetation on the general circulation: The role of albedo in modulating climate change p 3348 N94-29749
Sensitivity and feedbacks associated with vegetation-related land surface parameters in a general circulation model p 3348 N94-29800
ALERTNESS
Strategies to sustain and enhance performance in stressful environments
[AD-A275223] p 3398 N94-29027
Maintaining vigilance on a simulated ATC monitoring task across repeated sessions
[DOT/FAA/AM-94/6] p 3143 N94-30933
ALEUTIAN ISLANDS (US)
The rupture process of large earthquakes along convergent margins: Cast studies from Alaska and Armenia p 3363 N94-29969
ALGAE
Japan-China collaboration research program on terrestrial biology at Great Wall Station in King George Island, in the summer of 1990/1991
p 3358 N94-29085
Growth of hydrocarbon-rich microalga Botryococcus braunii in secondarily treated sewage and its consumption of nitrate ion and phosphate ion p 3387 N94-29519
Biodiesel from aquatic species
[DE94-000275] p 3225 N94-30038
ALGEBRA
Remarks on Galois symmetry in RCFT
[PB94-138179] p 3467 N94-29147
High level language-based robotic control system
[NASA-CASE-NPO-17918-2-CU] p 3435 N94-29465
Second-order algebraic specification of state semantics
[CWI-CS-R9254] p 3453 N94-29889
Is it possible to extend the deformed Weyl algebra W(sub q)(n) to a Hopf algebra?
[DE94-608092] p 3467 N94-30202

Categorial generalization of algebraic recursion theory
[ML-93-06] p 3456 N94-30382
Algebraic domains, chain completion, and the Plotkin powerdomain construction
[RUU-CS-93-03] p 3457 N94-30394
Homomorphism preserving algebraic specifications require hidden sorts
[CWI-CS-R9344] p 3459 N94-30436
The transient period of a cyclic process: An horizon theorem
[MEMO-1149] p 3427 N94-30585
GL(sub q)(N)-covariant quantum algebras and covariant differential calculus
[DE94-608072] p 3460 N94-30726
Graded Froelicher-Nijenhuis brackets and the theory of recursion operators for super differential equations
[MEMO-1147] p 3460 N94-30736
A structural co-induction theorem
[CWI-CS-R9346] p 3461 N94-30753
Fuzzy-algebra uncertainty analysis for abnormal-environment safety assessment
[DE94-006257] p 3462 N94-30849
Non-commutative geometry
[PB94-139342] p 3462 N94-30889
Undecidability in diagonalizable algebras
[ML-93-13] p 3463 N94-30976
Embeddings of Heyting algebras
[ML-93-14] p 3463 N94-30977

ALGOL

North American jumelage 'type systems'
[AD-A275342] p 3411 N94-29214

ALGORITHMS

Identification of components to optimize improvement in system reliability
[DE94-001601] p 3315 N94-28503
Large eddy simulations using lattice Boltzmann algorithms
[DE94-005666] p 3270 N94-28549
Applied analysis/computational mathematics
[DE94-005133] p 3451 N94-28571
Track filtering by robust neural network
[DE94-606067] p 3434 N94-28613
Frequency-domain transfer-function identification using Chebyshev polynomials
[DE94-004777] p 3451 N94-28739
The bootstrapped algorithm: A fast algorithm for blind signal separation
[AD-A275759] p 3408 N94-28760
Photorefractive adaptive antenna array processor
[AD-A275762] p 3241 N94-28762
Construction of a connectionist network supercomputer
[AD-A275765] p 3405 N94-28764
Design and packaging of fault tolerant optoelectronic multiprocessor computing system
[AD-A275896] p 3405 N94-28798
An efficient algorithm for 3D connect-the-dots
[AD-A275431] p 3409 N94-28866
Removal of coherent Extremely Low Frequency (ELF) background noise by adaptive noise cancellation
[AD-A275016] p 3243 N94-28898
Weighted and unweighted maximum clique algorithms with upper bounds from fractional coloring
[AD-A275328] p 3409 N94-28917
General theory and algorithms for the non-casual inversion, slewing and control of space-based articulated structures
[AD-A275118] p 3167 N94-29002
Algorithms for treating redundancy in repairable and non-repairable systems
[DE94-005289] p 3315 N94-29020
Center for Parallel Optimization
[AD-A274988] p 3431 N94-29127
Empirical studies of the value of algorithm animation in algorithm understanding
[AD-A275135] p 3412 N94-29287
Automatic focus and registration of synthetic aperture radar images p 3246 N94-29536
A digital combining-weight estimation algorithm for broadband sources with the array feed compensation system p 3250 N94-29660
Convolutional encoding of self-dual codes p 3250 N94-29662
An improved conscan algorithm based on a Kalman filter p 3251 N94-29670
Infrared properties of obscuring dust tori in active galactic nuclei p 3545 N94-29832
First principles pseudopotential calculations on aluminum and aluminum alloys
[DE94-004890] p 3206 N94-29931
Algorithm and code development for unsteady three-dimensional Navier-Stokes equations
[NASA-CR-195774] p 3277 N94-29942
High-resolution algorithms for the Navier-Stokes equations for generalized discretizations p 3278 N94-29965
Investigations of dispersion characteristics of microwave/optical guided wave structures by using transmission line matrix method
[ISBN-0-315-85856-7] p 3254 N94-30034
Complicated problem solution techniques in optimal parameter searching
[DE94-608007] p 3421 N94-30077
Fast precise algorithm for simulation of ionization energy losses
[DE94-608010] p 3421 N94-30080
Algorithm and program ORANGE for magnetic field simulation of magnetic system spectrometer STORS
[DE94-608013] p 3421 N94-30083
A lateral inhibition neural network that emulates a winner-takes-all algorithm
[RUU-CS-92-46] p 3438 N94-30334
Two algorithms for finding rectangular duals of planar graphs
[RUU-CS-92-41] p 3423 N94-30345
A deterministic algorithm for the three-dimensional diameter problem
[RUU-CS-92-45] p 3424 N94-30348
The exact fitting problem in higher dimensions
[RUU-CS-92-37] p 3456 N94-30377
Pearl's belief propagation: The proofs
[RUU-CS-92-47] p 3456 N94-30378
Self-stabilizing l-exclusion algorithms
[RUU-CS-93-01] p 3424 N94-30379
Development and validation of a linear recursive order-N algorithm for the simulation of flexible space manipulators dynamics
[AD-B173557] p 3311 N94-30391
The conjoinability relation in Lambek calculus in linear logic
[ML-93-03] p 3457 N94-30397
Fast and efficient variable-to-fixed-length coding algorithm
[PB94-125465] p 3424 N94-30400
Minimum fill-in for chordal bipartite graphs
[RUU-CS-93-11] p 3458 N94-30404
Treewidth of circle graphs
[RUU-CS-93-12] p 3458 N94-30405
Shape from diameter: Positive results
[RUU-CS-93-17] p 3458 N94-30408
A probabilistic approach to motion planning for car-like robots
[RUU-CS-93-18] p 3438 N94-30410
An all pairs shortest paths distributed algorithm using 2n(exp 2) messages
[RUU-CS-93-19] p 3432 N94-30411
A more compact visibility representation
[RUU-CS-93-26] p 3425 N94-30426
Thermodynamics of computation and information distance
[CWI-CS-R9341] p 3526 N94-30433
The Boltzmann entropy and randomness tests
[CWI-CS-R9342] p 3426 N94-30434
Analysis and an image recovery algorithm for ultrasonic tomography system p 3397 N94-30456
Efficient and constructive algorithms for the pathwidth and treewidth of graphs
[RUU-CS-93-27] p 3426 N94-30488
Unsupervised texture image segmentation by improved neural network ART2
[AIAA PAPER 94-1199-CP] p 3442 N94-30549
Perception system and functions for autonomous navigation in a natural environment
[AIAA PAPER 94-1201-CP] p 3443 N94-30552
Accuracy metrics for judging time scale algorithms p 3471 N94-30656
An algorithm for the Italian atomic time scale p 3473 N94-30868
Placing registration marks
[RUU-CS-93-21] p 3427 N94-30725
Dynamic microsets for RAMs
[RUU-CS-93-22] p 3406 N94-30727
Perfect binary space partitions
[RUU-CS-93-23] p 3460 N94-30728
Relations between varieties of Kolmogorov complexities
[CWI-CS-R9329] p 3427 N94-30732
On the unification free PROLOG programs
[CWI-CS-R9331] p 3427 N94-30733
The (n squared)-hard problems in computational geometry
[RUU-CS-93-15] p 3461 N94-30747
Systematic error estimation in multisensor fusion systems
[AD-B179298] p 3428 N94-30764
Computing at the leading edge: Research in the energy sciences
[DE94-006121] p 3563 N94-30844
Optimal size finite element meshes without obtuse and small angles
[RUU-CS-92-39] p 3462 N94-30860
ELF: Learning incomplete fuzzy rule sets for an autonomous robot
[REPT-93-043] p 3449 N94-30923
Theoretical and experimental analysis of a new algorithm for the Euclidean 1-center problem
[REPT-93-045] p 3429 N94-30924
Heuristic algorithms for static and dynamic problems of locating the center and the barycenter of a graph
[REPT-93-050] p 3429 N94-30925
Optimization techniques for a dial-a-ride transportation system in urban environment
[REPT-93-051] p 3537 N94-30926
Use of snakes to link edge points to create left ventricular boundaries in echocardiographic images
[TELECOM-93-D-016] p 3395 N94-30970
The Stroemberg wavelet on the interval and the Franklin system
[TELECOM-93-C-002] p 3462 N94-30971

ALIGNMENT

A non-contacting vertical alignment system for mass properties measuring instruments
[DE94-004680] p 3289 N94-29927

ALIPHATIC HYDROCARBONS

Structural changes during carbonization and oxidation of coal p 3187 N94-28678

ALKALI METALS

Synthesis and neutron diffraction study of Na3WN3 and Na3MoN3
[AD-A275158] p 3203 N94-29043
The direct observation of alkali vapor species in biomass combustion and gasification
[DE94-000262] p 3339 N94-30606
Rotator phases in narrow-gap semiconductors
[DE94-005472] p 3521 N94-30897

ALKANES

The active titration method for measuring local hydroxyl radical concentration p 3345 N94-28602

ALKYL COMPOUNDS

Group transfer and electron transfer reactions of organometallic complexes: Summary of research accomplished in 1993
[DE94-004963] p 3200 N94-30770

ALLOYING

Low temperature behavior of virgin martensite
[PB94-132925] p 3204 N94-29142
Mechanical alloying processing with application to structural materials: ASSERT supplement
[AD-A275400] p 3204 N94-29205
Nanosize metal alloy particle formation in Ag and Cu sequentially implanted silica
[DE94-005592] p 3207 N94-30042
Studies on the optimization of deformation processed metal-metal matrix composites
[DE94-006033] p 3185 N94-30704
Influence of tungsten alloying additions on the mechanical properties and texture of tantalum
[DE94-004994] p 3210 N94-30774
Method of test for cleanness assessment of metal alloys: The preparation of button specimens by electron beam melting and the characterisation of recovered inclusions
[NPL-DMM(A)-130] p 3210 N94-30796

ALLOYS

Generalized augmented space theorem for correlated disorder and cluster coherent potential approximation
[DE94-608110] p 3208 N94-30118

ALOHA SYSTEM

M-interference queue analysis by decomposition method
[ISBN-0-315-85795-1] p 3453 N94-30139

ALTERNATING CURRENT

Development of Alternating Current Potential Drop (ACPD) procedures for crack detection in aluminum aircraft panels
[AD-A275755] p 3315 N94-28646

ALTERNATING DIRECTION IMPLICIT METHODS

Unsteady aerodynamic computations around NACA0012 at high angles of attack p 3126 N94-28969

ALTITUDE SIMULATION

Decompression sickness risk versus time and altitude
[AD-A275261] p 3391 N94-29071

ALTITUDE TOLERANCE

Japanese Journal of Aerospace and Environmental Medicine, vol. 30, no. 3
[JTN-94-80606] p 3387 N94-28495

ALUMINIDES

Directional solidification studies in Ni-Al alloys
[DE94-005562] p 3201 N94-28527
Fusion welding with self-generated filler metal
[NASA-CASE-LEW-15671-1] p 3301 N94-29557
Thermodynamic analysis of chemical compatibility of several compounds with Fe-Cr-Al alloys
[NASA-CR-191166] p 3181 N94-29684

ALUMINUM

High resistivity buffer layers by oxygen doping
[AD-A274986] p 3513 N94-29125

Pit initiation on passivated metal surfaces: Crystallographic orientation and environmental effects
[ISBN-0-315-85433-2] p 3208 N94-30138
The long-range transport of aerosol particles over the North Atlantic Ocean p 3366 N94-30867

ALUMINUM ALLOYS
Directional solidification studies in Ni-Al alloys
[DE94-005562] p 3201 N94-28527
Failures to model the development of a cube texture during the high temperature compression of Al-Mg alloys
[DE94-005013] p 3201 N94-28544
Development of Alternating Current Potential Drop (ACPD) procedures for crack detection in aluminum aircraft panels
[AD-A275755] p 3315 N94-28646
Role of microstructure on the fatigue durability of aluminum aircraft alloys
[AD-A275814] p 3202 N94-28830
Cold expansion and interference for extending the fatigue life of multi-layer metal joints
[AD-A274982] p 3318 N94-29091
Electrical conductivity measurements on a SiCp/Al alloy metal matrix composite
[PB94-138310] p 3263 N94-29120
Electrochemical behavior and surface chemistry of nonequilibrium aluminum alloys: Passivity mechanism and fabrication methods
[AD-A275401] p 3204 N94-29196
The effect of various metallurgical parameters on the flow and fracture behavior of polycrystalline NiAl near the brittle-to-ductile transition
[NASA-TM-106534] p 3205 N94-29758
The effect of mechanical paint stripping on the fatigue and fracture of thin aluminum airplane skin p 3205 N94-29900
First principles pseudopotential calculations on aluminum and aluminum alloys
[DE94-004890] p 3206 N94-29931
Non-chromate talc conversion coatings for aluminum
[DE94-005281] p 3207 N94-30053
Directional solidification characteristics of hyper-eutectic Al-Cu alloys under varying gravity conditions
[ISBN-0-315-86108-8] p 3209 N94-30146
Incommensurate magnetic order in UNi2Al3
[DE94-005449] p 3209 N94-30246
An investigation of the corrosion properties of aluminum-tantalum alloys using electrochemical impedance spectroscopy and local electrochemical impedance spectroscopy p 3209 N94-30521
Study of nucleation and growth in Al-Zn alloys using TEM
[DE94-006312] p 3211 N94-30852

ALUMINUM ARSENIDES
Structural characterization of semiconductor heterostructures by atomic resolution Z-contrast imaging at 300 kV
[DE94-006561] p 3516 N94-30063
Strain relaxation and surface roughness as a function of growth temperature in linearly graded In(x)Al(1-x)As (x = 0.05 to 0.25) buffers
[DE94-005430] p 3519 N94-30592
Ion damage studies in GaAs/Al(0.6)Ga(0.4)As/GaAs heterostructures
[DE94-005384] p 3521 N94-30894

ALUMINUM COATINGS
Composite flexible blanket insulation
[NASA-CASE-ARC-11955-1-CU] p 3180 N94-29509

ALUMINUM GALLIUM ARSENIDES
Quantum interference phenomena and novel switching in split gate high electron mobility transistors p 3266 N94-29734

ALUMINUM NITRIDES
MOCVD growth of GaN, AlN and AlGaN for UV photodetector applications
[AD-A275078] p 3512 N94-28871

ALUMINUM OXIDES
Pull-test adhesion measurements of diamondlike carbon films on silicon carbide, silicon nitride, aluminum oxide, and zirconium oxide
[DE94-005469] p 3211 N94-28536
Adhesion of electrolessly deposited Ni(P) on alumina ceramic
[ETN-94-95358] p 3212 N94-28539
Density reduction: A mechanism for amorphization at high ion doses
[DE94-004793] p 3483 N94-28559
Fabrication and testing of plasma-spray formed MoSi2 and MoSi2 composite tubes
[DE94-004995] p 3175 N94-28581
Alumina ceramic: A cost effective replacement for titanium in deep submergence pressure housings
[AD-A275640] p 3212 N94-28641
Superplasticity in fine-grained ceramics
[AD-A275461] p 3212 N94-28733
Effect of surface condition on strength and fatigue behavior of alumina ceramic
[AD-A275053] p 3214 N94-29133
Interface engineering in alumina fiber/glass composites p 3182 N94-29852
Distribution functions of electrons within aluminium oxide thin films
[DE94-608418] p 3490 N94-30184
Ionic conduction mechanisms in CaF2 and CaF2-Al2O3 nanocomposite films on Al2O3 substrates
[DE94-004792] p 3520 N94-30773

ALUMINUM SILICATES
Fatigue behavior of a cross-ply ceramic matrix composite at elevated temperatures under tension-tension loading
[AD-A275466] p 3176 N94-28673

AMAZON REGION (SOUTH AMERICA)
Amazonia: Remote sensing test site and survey p 3327 N94-28935

AMBIENT TEMPERATURE
Deterioration of manual performance in cold and windy climates p 3381 N94-28434
Anode for rechargeable ambient temperature lithium cells
[NASA-CASE-NPO-18580-1-CU] p 3265 N94-29505
Particulate metal matrix composites: Draft procedure for tensile tests at ambient temperature
[NPL-DMM(A)-100] p 3184 N94-30419

AMBIGUITY
Method for ambiguity resolution in range-Doppler measurements
[NASA-CASE-GSC-13542-1] p 3252 N94-29739

AMMONIA
Low energy ion-molecule reactions and chemiionization kinetics
[DE94-005414] p 3481 N94-28491
A study of low emissions gas turbine combustions
[NASA-CR-195763] p 3152 N94-29860
Direct measurement of the reactivity of NH and OH on a silicon nitride surface
[DE94-005286] p 3199 N94-30260

AMMONIUM PERCHLORATES
Correlation of cookoff behavior of rocket propellants with thermomechanical and thermochemical properties
[AD-A274983] p 3224 N94-29092

AMORPHOUS MATERIALS
Pull-test adhesion measurements of diamondlike carbon films on silicon carbide, silicon nitride, aluminum oxide, and zirconium oxide
[DE94-005469] p 3211 N94-28536
Density reduction: A mechanism for amorphization at high ion doses
[DE94-004793] p 3483 N94-28559
High damage threshold anti-reflectors by physical vapor deposited amorphous fluoropolymer
[DE94-004865] p 3212 N94-28560
Anode for rechargeable ambient temperature lithium cells
[NASA-CASE-NPO-18580-1-CU] p 3265 N94-29505
Preparation and structure of amorphous hydrogenated carbon film deposited with RF plasma CVD p 3223 N94-29518
Creep and physical aging of PVC: Dependence on stress and temperature
[NPL-DMM(A)-115] p 3217 N94-29886
Induced crystallization in CW laser-irradiated sol-gel deposited titania films
[DE94-006527] p 3207 N94-30062
Plasma enhanced chemical vapor deposition of ZrO2 thin films
[DE94-006031] p 3218 N94-30104
Optical studies of dynamical processes in disordered systems
[DE94-006751] p 3501 N94-30252
Structural analysis of amorphous phosphates using high performance liquid chromatography
[DE94-004791] p 3199 N94-30723

AMORPHOUS SILICON
Survey report of JSUP Space Environment Utilization Research Committee in fiscal year 1992: Functional New Materials Session
[JTN-94-80582] p 3159 N94-30162

AMPLIFIER DESIGN
Tunnelling hot electron transfer amplifiers
[AD-A275529] p 3262 N94-28687

AMPLIFIERS
Tunnelling hot electron transfer amplifiers
[AD-A275529] p 3262 N94-28687

AMPOULES
Ampoule failure sensor time response testing: Experiment 1
[NASA-TM-108449] p 3290 N94-30199

ANAEROBES
One carbon metabolism in anaerobic bacteria: Regulation of carbon and electron flow during organic acid production
[DE94-004852] p 3386 N94-30180

ANALOG CIRCUITS
Nonvolatile programmable neural network synaptic array
[NASA-CASE-NPO-18578-1-CU] p 3265 N94-29426
Design and analysis of a low-loss linear analog phase modulator for deep space spacecraft X-band transponder applications p 3248 N94-29625
Unsupervised learning in analog networks
[ISBN-0-315-85959-8] p 3432 N94-30140
A bipolar analog front-end integrated circuit for the SDC silicon tracker
[DE94-005203] p 3267 N94-30711

ANALOG DATA
MPEG-2 video decoding architecture: Analysis and design
[REPT-93-069] p 3260 N94-30940

ANALOG TO DIGITAL CONVERTERS
Advanced optical A/D converter
[AD-A275663] p 3498 N94-28656
Spurs in digital radio frequency memory and applications of DRFM
[AD-A275013] p 3243 N94-28897
Recent results from testing fast ADCs
[DE94-005565] p 3406 N94-30004
Polynomial modeling of analog-to-digital converters
[DE94-005579] p 3406 N94-30008

ANALYSIS OF VARIANCE
Noise and drift analysis of non-equally spaced timing data p 3472 N94-30667

ANALYTIC FUNCTIONS
Some remarkable sine and cosine functions
[PB94-137759] p 3453 N94-29439

ANATOMY
Elements for the recognition of three dimensional deformable shapes: Application to biomedical imagery
[TELECOM-93-E-006] p 3396 N94-30978

ANDESITE
Influence of clearance and rake angles on the cutting force of rock p 3368 N94-29520

ANGIOSPERMS
Cellular polarity and interactions in plant graviperception
[NASA-CR-195261] p 3385 N94-29943

ANGLE OF ATTACK
Numerical analysis of airfoil for helicopter blade at high angle of attack using Navier-Stokes code p 3124 N94-28958
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion p 3130 N94-29674
Aerodynamic characteristics of a propeller-powered high-lift semispan wing
[NASA-TM-4541] p 3132 N94-29937
The viability of photovoltaics on the Martian surface
[NASA-TM-106478] p 3338 N94-30196

ANGLES (GEOMETRY)
Influence of clearance and rake angles on the cutting force of rock p 3368 N94-29520

ANGULAR CORRELATION
The angular two-point correlation function of galaxies down to 25th mag p 3547 N94-30010

ANGULAR MOMENTUM
A gimbaled low noise momentum wheel p 3162 N94-29640

ANHYDRIDES
Low dielectric polyimide fibers
[NASA-CASE-LAR-14526-1] p 3214 N94-29359

ANIONS
Measurement of elemental speciation by liquid chromatography: Inductively coupled plasma mass spectrometry (LC-ICP-MS) with the Direct Injection Nebulizer (DIN)
[DE94-005261] p 3187 N94-28483
Rotator phases in narrow-gap semiconductors
[DE94-005472] p 3521 N94-30897

ANISOTROPIC MEDIA
Three dimensional transient analysis of microstrip circuits in multilayered anisotropic media
[AD-A274995] p 3283 N94-28995

ANISOTROPY
Practical superconductor development for electrical power applications
[DE94-005378] p 3261 N94-28487
An anisotropic extension of Bodner's model of viscoplasticity: Model development
[NASA-CR-195289] p 3318 N94-28821
The effects of molecular orientation geometry and surface anisotropy upon etching
[AD-A275154] p 3486 N94-29032
Effects and implications of fault zone heterogeneity and anisotropy on earthquake strong ground motion p 3363 N94-29941
Magnetic properties of the three dimensional Ising model with interface single-ion anisotropy
[DE94-608116] p 3525 N94-30164

ANNEALING
Modeling the total dose radiation effects of Hg(1-x)Cd(x)Te photodiodes using numerical device simulators
[AD-A275235] p 3263 N94-29028
An analysis of the microstructure and reinforcement distribution of an extruded particle-reinforced Al 6061-10 volume percent Al2O3 metal matrix composite
[AD-A275050] p 3178 N94-29166
ECR plasma synthesis of silicon nitride films on GaAs and InSb
[DE94-005575] p 3515 N94-30006
Microstructure and mechanical properties of nitrided molybdenum silicide coatings
[DE94-006249] p 3217 N94-30025
Plasma enhanced chemical vapor deposition of ZrO2 thin films
[DE94-006031] p 3218 N94-30104
Characterization of thermally annealed Sb implanted fused silica
[DE94-005464] p 3219 N94-30335
Ionic conduction mechanisms in CaF2 and CaF2-Al2O3 nanocomposite films on Al2O3 substrates
[DE94-004792] p 3520 N94-30773

ANNIHILATION REACTIONS
Path integral for coherent states of the dynamical U(sub 2) group and U(sub 2/1) supergroup
[DE94-606382] p 3466 N94-28785
One-loop QCD mass effects in the production of polarized bottom and top quarks
[PB94-138104] p 3467 N94-29145
Direct anti-b b production in anti-pp collisions at the square root of s = 1.8 TeV
[DE94-006167] p 3491 N94-30369
Charmonium and bottomonium in (-p)p interactions
[DE94-006173] p 3493 N94-30886
Inclusive single muon production in D0
[DE94-006175] p 3493 N94-30887

ANNUAL VARIATIONS
Thermal variation in vegetated or snow-covered background scenes and its effect on passive infrared systems
[AD-A275174] p 3325 N94-28849
On the annual cycle of the tropical Pacific atmosphere and ocean p 3371 N94-29763
A study of precipitation in the coastal area of Antarctica as observed at Syowa Station using a vertical pointing radar p 3363 N94-29979
A toy model of sea ice growth p 3351 N94-30626

ANNULAR FLOW
A numerical method for confined unsteady flows related to fluid-structure interactions
[ISBN-0-315-74739-0] p 3277 N94-29902

ANODES
Dendrite preventing separator for secondary lithium batteries
[NASA-CASE-NPO-18585-1-CU] p 3265 N94-29411
Anode for rechargeable ambient temperature lithium cells
[NASA-CASE-NPO-18580-1-CU] p 3265 N94-29505

ANODIZING
Anodization of copper in chloride media
[AD-A275565] p 3202 N94-28793
An analysis of the microstructure and reinforcement distribution of an extruded particle-reinforced Al 6061-10 volume percent Al2O3 metal matrix composite
[AD-A275050] p 3178 N94-29166

ANTARCTIC OCEAN
Dynamic constraints on CO2 uptake by an iron-fertilized Antarctic p 3350 N94-30619

ANTARCTIC REGIONS
Medical support for British operations in the Antarctic p 3379 N94-28421
Antarctic Record, volume 36, no. 1
[REPT-106-VOL-36-NO-1] p 3357 N94-29078
Estimation of geomagnetic conjugate points by using Pc5 pulsations p 3357 N94-29079
Activities of the wintering party at Showa Station by the 31st Japanese Antarctic Research Expedition in 1990 p 3358 N94-29083
Activities of the fourth wintering party at Asuka Station by the 31st Japanese Antarctic Research Expedition in 1990 p 3358 N94-29084
Japan-China collaboration research program on terrestrial biology at Great Wall Station in King George Island, in the summer of 1990/1991 p 3358 N94-29085
Protocol on environmental protection to the Antarctic Treaty and its annexes: International agreement on the comprehensive measures for the protection of Antarctic environment and ecosystems p 3354 N94-29086
Observations of the geomagnetic field by Polar Patrol Balloon (PPB) experiment in Antarctica p 3359 N94-29235
Long term variations of radio auroral activity p 3359 N94-29237
New-type echoes observed with the 50 MHz auroral Doppler radar at Showa Station p 3360 N94-29238
Initial observation results with imaging riometer at NY-Alesund (L is equal to 16) p 3360 N94-29239
A theory of current generator in the magnetosphere-ionosphere coupling p 3360 N94-29240
Cosmogenic C-14 in Antarctic and non-Antarctic meteorites and lunar samples
[NASA-CR-195795] p 3546 N94-29905
Antarctic Record, vol. 36, no. 3
[REPT-108] p 3363 N94-29978
A study of precipitation in the coastal area of Antarctica as observed at Syowa Station using a vertical pointing radar p 3363 N94-29979
Data transfer system using a multi-ID ARGOS transmitter for the Antarctic polar patrol balloon experiment p 3363 N94-29980
Activities of the wintering party at Syowa Station by the 32nd Japanese Antarctic Research Expedition in 1991 p 3364 N94-29986

ANTENNA ARRAYS
Photorefractive adaptive antenna array processor
[AD-A275762] p 3241 N94-28762
Solid-state, active-phased arrays: Some aspects of receiver design
[AD-A275893] p 3527 N94-28779
Pointing mechanisms for the Shuttle Radar Laboratory p 3162 N94-29638
A digital combining-weight estimation algorithm for broadband sources with the array feed compensation system p 3250 N94-29660
Digital combining-weight estimation for broadband sources using maximum-likelihood estimates p 3250 N94-29661
A comparison of full-spectrum and complex-symbol combining techniques for the Galileo S-band mission p 3250 N94-29665
A 32 GHz microstrip array antenna for microspacecraft application p 3251 N94-29668
Radiation and scattering from cylindrically conformal printed antennas
[NASA-CR-195546] p 3253 N94-29873
Radial microstrip slotline feed network for circular mobile communications array
[NASA-TM-106540] p 3267 N94-30198
Synchronization of microwave oscillators by direct optical injection
[ISBN-0-315-85546-0] p 3500 N94-30233

ANTENNA DESIGN
Defocussing characteristics of the ACTS, T1-VSAT Earth terminal antennas
[NASA-TM-106420] p 3242 N94-28826
Beam scanning offset Cassegrain reflector antennas by subreflector movement
[NASA-CR-191604] p 3160 N94-28836
Active antennas, a review
[PB94-137445] p 3243 N94-28907
Screening of flexible cables by nonlinear resistance measurements
[AD-A275193] p 3264 N94-29289
Theoretical and experimental study of a cylindrical microstrip antenna
[REPT-932-440-109] p 3245 N94-29456
Elevation control system model for the DSS 13 antenna p 3248 N94-29622
A module concept for a cable-mesh deployable antenna p 3161 N94-29631
Waves in space plasma dipole antenna subsystem p 3161 N94-29632
A 32 GHz microstrip array antenna for microspacecraft application p 3251 N94-29668
Radiation and scattering from cylindrically conformal printed antennas
[NASA-CR-195546] p 3253 N94-29873
Three-dimensional effects for radio frequency antenna modeling
[DE94-006102] p 3255 N94-30105

ANTENNA FEEDS
Defocussing characteristics of the ACTS, T1-VSAT Earth terminal antennas
[NASA-TM-106420] p 3242 N94-28826
A dual-cavity ruby maser for the Ka-band link experiment p 3250 N94-29658

ANTENNA RADIATION PATTERNS
Defocussing characteristics of the ACTS, T1-VSAT Earth terminal antennas
[NASA-TM-106420] p 3242 N94-28826
Screening of flexible cables by nonlinear resistance measurements
[AD-A275193] p 3264 N94-29289
Theoretical and experimental study of a cylindrical microstrip antenna
[REPT-932-440-109] p 3245 N94-29456
Radiation and scattering from cylindrically conformal printed antennas
[NASA-CR-195546] p 3253 N94-29873
Integral equation analysis of composite bodies of revolution and arbitrary surfaces with application to cavity-backed antennas p 3253 N94-29883
Three-dimensional effects for radio frequency antenna modeling
[DE94-006102] p 3255 N94-30105
A physical optics model for scattering of HF radiation by irregular terrain
[DE94-006187] p 3255 N94-30106

ANTIBIOTICS
Microencapsulation of anti-tumor, antibiotic and thrombolytic drugs in microgravity p 3397 N94-30453

ANTIBODIES
Effects of pressure on membrane-associated receptors and effector elements
[AD-A275813] p 3384 N94-28829

ANTICYCLONES
On interannual variability and climate change in the North Pacific p 3374 N94-29963

ANTIFERROMAGNETISM
Some results on the phase diagram of the antiferromagnetic Potts model in an external magnetic field
[DE94-608115] p 3468 N94-30110
Magnetic properties of the three dimensional Ising model with interface single-ion anisotropy
[DE94-608116] p 3525 N94-30164

ANTIMISSILE DEFENSE
Dual-use applications of infrared sensitive materials
[AD-A275140] p 3499 N94-29694
TacSats for NATO
[AGARD-AR-322] p 3169 N94-30350

ANTIOXIDANTS
Development of radiation resistant electrical cable insulations p 3223 N94-30480
Development of radiation resistant electrical cable insulations
[DE94-005189] p 3222 N94-30906

ANTIPROTONS
Properties of W + jet events in proton-antiproton collisions at 1.8 TeV
[DE94-004002] p 3482 N94-28524
Properties of events containing a photon and several jets seen in p(bar p) collisions at (radical)s = 1.8 TeV
[DE94-005596] p 3482 N94-28531
Inclusive jet and direct photon production at the D0 experiment
[DE94-006001] p 3488 N94-30049
A search for rapidity gap events in p(bar p) collisions at D(0)
[DE94-004654] p 3491 N94-30722

ANTIREFLECTION COATINGS
High damage threshold anti-reflectors by physical vapor deposited amorphous fluoropolymer
[DE94-004865] p 3212 N94-28560
A new guided wave lens structure and its application
[AD-A275541] p 3499 N94-28813

ANTISUBMARINE WARFARE
Quadruplet expansion of the acoustic pressure field in a wedge shaped ocean
[AD-A275121] p 3477 N94-29003

APERTURES
Printed circuit elements with applications to antennas, scattering, and circuits
[AD-A275512] p 3262 N94-28669
Design and testing of the LITE Variable Field Stop mechanism p 3161 N94-29633
Enhanced coherence x ray laser experiments and simulations
[DE94-005367] p 3295 N94-30060

APEXES
Stability properties of inclusive connectivity for graphs
[AD-A275360] p 3452 N94-29016

APPLICATION SPECIFIC INTEGRATED CIRCUITS
Realization of function logics by means of transmission gate
[REPT-93-061] p 3429 N94-30936

APPLICATIONS PROGRAMS (COMPUTERS)
SPC toolbox: An interactive MATLAB (tm) package for signal modeling, analysis, and communications
[AD-A275617] p 3241 N94-28634
A program for rapid computation of multioffset vertical seismic profile synthetic seismograms for layered media
[AD-A275464] p 3355 N94-28737
Comparing Ada and FORTRAN lines of code: Some experimental results
[AD-A275322] p 3409 N94-28878
Quadruplet expansion of the acoustic pressure field in a wedge shaped ocean
[AD-A275121] p 3477 N94-29003
WINDOW 4.0: Documentation of calculation procedures
[DE94-004935] p 3410 N94-29019

Preliminary analysis of Asynchronous Transfer Mode (ATM) over microwave channels
[AD-A275214] p 3243 N94-29069
Solution of augmented systems
[PB94-138211] p 3452 N94-29111
EXTdesign. Version 1.0: Reference manual
[PB94-136827] p 3411 N94-29193
Flight command software development: RAFALE studies p 3413 N94-29320
The development procedures and tools applied for the attitude control software of the Italian satellite SAX p 3170 N94-29324
A common Ada run-time system for avionics software p 3150 N94-29331
Distributed applications and failure tolerance programs using a reconfigurable parallel architecture p 3417 N94-29345
Tidal atlas software development
[AD-A275251] p 3377 N94-29432
High level language-based robotic control system
[NASA-CASE-NPO-17918-2-CU] p 3435 N94-29465
Considerations on graphical user interfaces for intelligent ATM support systems p 3139 N94-29572
Finite element method for numerical simulation of turbulent flows. The N3S code p 3233 N94-29612
A pot-pourri of results in QCD from large lattice simulations on the CM5
[DE94-005084] p 3514 N94-29818
Abundance patterns in red-giant CH stars p 3539 N94-29820
Splines and ocean wave modelling
[PB94-139409] p 3378 N94-30002
Smart Document System (SDS) used in managing DOE order's with electronic Engineering Procedures
[DE94-005076] p 3534 N94-30099
An interactive, design and educational tool for supersonic external-compression inlets
[NASA-TM-106581] p 3421 N94-30174
An interactive educational tool for compressible aerodynamics
[NASA-TM-106568] p 3422 N94-30175
The ergonomics of computer interfaces: Designing a system for human use
[CWI-CS-R9258] p 3402 N94-30320
Programming aspects of Views: An open-architecture application environment
[CWI-CS-R9259] p 3422 N94-30321
Modelling interaction tools in the Views architecture
[CWI-CS-R9261] p 3423 N94-30323
The Views application environment
[CWI-CS-R9257] p 3423 N94-30341
Potential capabilities of Reynolds stress turbulence model in the COMMIX-RSM code p 3285 N94-30450

APPROACH

Los Angeles international airport instrument landing system approach data collection and reduction, phase 1
[AD-A275115] p 3136 N94-28914
Extremely Low Visibility IFR Rotorcraft Approach (ELVIRA) operational concept development. Volume 1: Executive Summary
[DOT/FAA/RD-94/1,I] p 3142 N94-30189

APPROACH CONTROL

Advanced air traffic control and flight management system concepts p 3140 N94-29576
Profile negotiation: An air/ground automation integration concept for managing arrival traffic p 3140 N94-29578
Experimental flight management system p 3141 N94-29580
Extremely Low Visibility IFR Rotorcraft Approach (ELVIRA) operational concept development. Volume 1: Executive Summary
[DOT/FAA/RD-94/1,I] p 3142 N94-30189
Flight simulator evaluation of advanced MLS procedures
[AD-B174270] p 3143 N94-30915

APPROACH INDICATORS

Key cognitive issues in the design of electronic displays of instrument approach procedure charts
[AD-A275647] p 3399 N94-28649

APPROXIMATION

Approximation of solutions of the cubic NLSE by finite dimensional equations and non-squeezing properties
[PB94-138294] p 3452 N94-29148
Strategy for the approximation of large scattered data sets
[PB94-138518] p 3420 N94-29949
Splines and ocean wave modelling
[PB94-139409] p 3378 N94-30002
Approximation methods for nonlinear operator equations of the m-accretive type
[DE94-608099] p 3467 N94-30065
Generalized augmented space theorem for correlated disorder and cluster coherent potential approximation
[DE94-608110] p 3208 N94-30118
L(sub)p optimal d dimensional triangulations for piecewise linear interpolation: A new result on data dependent triangulations
[RUU-CS-93-13] p 3458 N94-30406
Optimization techniques for a dial-a-ride transportation system in urban environment
[REPT-93-051] p 3537 N94-30926

AQUEOUS SOLUTIONS

Quenching of the excited state of hydrated Europium(3) ions by electron transfer
[DE94-005553] p 3482 N94-28518

AQUICULTURE

Bulletin of National Research Institute of Fisheries Engineering, No. 13
[JTN-94-80596] p 3233 N94-29701
Reproduction in the Japanese anchovy (Engraulis japonica) as related to population fluctuation p 3235 N94-29708

ARC DISCHARGES

Evaluation of pyrolysis and arc tracking on candidate wire insulation designs for space applications p 3166 N94-28711
A new test method for the assessment of the arc tracking properties of wire insulation in air, oxygen enriched atmospheres and vacuum p 3167 N94-28714
Non-isolated 30 kW class arcjet PCU
[NASA-CR-189148] p 3173 N94-29444

ARC HEATING

Numerical simulation of arc heated wind tunnel flow p 3123 N94-28951

ARC JET ENGINES

Arcjet system integration development
[NASA-CR-187147] p 3171 N94-28736
Non-isolated 30 kW class arcjet PCU
[NASA-CR-189148] p 3173 N94-29444

ARC SPRAYING

Direct measurement of the reactivity of NH and OH on a silicon nitride surface
[DE94-005286] p 3199 N94-30260

ARC WELDING

Welding wire pressure sensor assembly
[NASA-CASE-MFS-26216-1-SB] p 3300 N94-29506
Programmable Automated Welding System (PAWS): Control of welding through software and hardware p 3314 N94-30443
Sensing the gas metal arc welding process p 3314 N94-30444

ARCHITECTURE (COMPUTERS)

Performance analysis of memory hierachies in high performance systems
[DE94-005549] p 3404 N94-28517
Data fusion and correlation techniques testbed development audio processing study
[SKD-1600-73-014] p 3241 N94-28532
Process guide for the Domain-Specific Software Architectures (DSSA) process life cycle
[AD-A275642] p 3407 N94-28648
Design of parallel systems for signal processing
[AD-A275490] p 3430 N94-28659
The state transition diagram with path priority and it's applications
[AD-A275524] p 3434 N94-28672
Construction of a connectionist network supercomputer
[AD-A275765] p 3405 N94-28764
A/GATECH DOSP fabrication --- optical programmable logic array
[AD-A275848] p 3430 N94-28781
Advanced languages for systems software
[AD-A275272] p 3410 N94-29007
How to control the increase in the complexity of civil aircraft on-board systems p 3150 N94-29316
Hierarchical Object Oriented Design (HOOD): Possibilities, limitations, and challenges p 3413 N94-29322
Distributed applications and failure tolerance programs using a reconfigurable parallel architecture p 3417 N94-29345
Future manned systems advanced avionics study
[NASA-CR-188277] p 3150 N94-29377
Lasercom system architecture with reduced complexity
[NASA-CASE-NPO-19069-1-CU] p 3293 N94-29493
Software Management Environment (SME) concepts and architecture, revision 1
[NASA-CR-189293] p 3419 N94-29727
Design for dependability: A simulation-based approach
[NASA-CR-195757] p 3420 N94-29890
The MSRC ab initio methods benchmark suite: A measurement of hardware and software performance in the area of electronic structure methods
[DE94-006428] p 3514 N94-30001
A locally synchronous globally asynchronous Vertex-8 processing element for image reconstruction on a mesh
[ISBN-0-315-86005-7] p 3432 N94-30143
Maestro: An open system architecture for multi-robot control p 3306 N94-30288
Modelling the evolution of information systems
[TR-92-36] p 3535 N94-30329
Evolving information systems: Meeting the ever-changing environment
[TR-92-24] p 3535 N94-30359
Object-based task-level control: A hierarchical control architecture for remote operation of space robots
[AIAA PAPER 94-1209-CP] p 3444 N94-30560
MPEG-2 video decoding architecture: Analysis and design
[REPT-93-069] p 3260 N94-30940
The experimental flight management system: An air traffic management research tool
[NLR-TP-92253-U] p 3143 N94-30943

ARCTIC OCEAN

The role of sea ice dynamics in global climate change p 3350 N94-30620

ARCTIC REGIONS

Evaluation of life support equipment during an unsupported North Pole expedition p 3379 N94-28422
A coupled approach to spatially derived parameters necessary for ecosystem modeling on the North Slope of Alaska: Appendix A
[DE94-005853] p 3349 N94-30046
Carbon cycling in high-latitude ecosystems p 3352 N94-30631

ARGON

Argon frost continuous cryopump for fusion applications
[DE94-004478] p 3230 N94-29017
Optical field ionization of atoms and ions using ultrashort laser pulses
[DE94-006643] p 3488 N94-29845
On possibility to create the scintillation trigger for liquid-argon neutrino detector
[DE94-607844] p 3489 N94-30050

ARGON PLASMA

Fullerenes as precursors for diamond film growth without hydrogen or oxygen additions
[DE94-004582] p 3519 N94-30718

ARGOS SYSTEM

Data transfer system using a multi-ID ARGOS transmitter for the Antarctic polar patrol balloon experiment p 3363 N94-29980

ARITHMETIC

A smart child of Peano's
[ML-92-10] p 3455 N94-30325
Embeddings of Heyting algebras
[ML-93-14] p 3463 N94-30977

ARIZONA

Evaluation of the National Meteorological Center mesoscale model for prediction of severe convection over Central Arizona p 3371 N94-29744

ARMED FORCES (UNITED STATES)

Evaluation of monitoring audiometry in the United States Air Force Hearing Conservation Program
[AD-A275309] p 3391 N94-29211

ARMENIA

The rupture process of large earthquakes along convergent margins: Cast studies from Alaska and Armenia p 3363 N94-29969

ARMOR

Simulation Networking/Training Requirements Relational Database: User's guide
[AD-A275634] p 3528 N94-28637
3-D braided, continuous fiber ceramic composites produced by chemical vapor infiltration
[AD-A275192] p 3178 N94-29024

AROMATIC COMPOUNDS

Structural changes during carbonization and oxidation of coal p 3187 N94-28678

ARSENIC

Aggregation equilibria in arsenic doped silicon
[DE94-607269] p 3515 N94-30005

ARSENIC COMPOUNDS

Measurement of elemental speciation by liquid chromatography: Inductively coupled plasma mass spectrometry (LC-ICP-MS) with the Direct Injection Nebulizer (DIN)
[DE94-005261] p 3187 N94-28483
Synthesis and molecular structures of R(Me3CCH2)2In-E(SiMe3) (R = Me3CCH2, E = P or As; R = Me, E = P)
[AD-A275020] p 3486 N94-29131

ARSENIDES

Tris(trimethylsily)arsine and lithium bis(trimethylsily)arsenide
[AD-A275075] p 3189 N94-29140

ARTERIES

Arterial oxygen saturation during +Gz acceleration by short-radius centrifuge p 3389 N94-28852

Remote control of transcranial Doppler (TCD) probe during centrifuge exposures up to 9 +Gz
[AD-A275253] p 3400 N94-29029

ARTIFICIAL INTELLIGENCE

Track filtering by robust neural network
[DE94-606067] p 3434 N94-28613
The state transition diagram with path priority and it's applications
[AD-A275524] p 3434 N94-28672
Information presentation for expert systems in future fighter aircraft
[AD-A275126] p 3149 N94-29005
Partial support for the Second International Symposium on Artificial Intelligence and Mathematics
[AD-A275199] p 3434 N94-29026
Basic research in computer science
[AD-A275184] p 3405 N94-29181
An architecturally-based theory of human sentence comprehension
[AD-A275380] p 3398 N94-29313
Object oriented design of the autonomous fixtaking management system p 3143 N94-29323
Artificial intelligence technology program at Rome Laboratory p 3414 N94-29328
A case-based approach to creative design
[AD-A275229] p 3417 N94-29390
Machine Intelligence in Air Traffic Management
[AGARD-CP-538] p 3136 N94-29558
Advances in development capabilities for intelligent air traffic management systems p 3137 N94-29559
Intelligent systems for air space control and management p 3137 N94-29560
Reinforcement learning for robots using neural networks p 3437 N94-29853
Proceedings of the 3rd Conference on Military Robotic Applications
[DRES-SP-149] p 3304 N94-30275
Autonomous intelligent military robots: Army ants, killer bees, and cybernetic soldiers p 3304 N94-30276
Performance evaluation of intelligent network services
[MEMO-INF-93-20] p 3438 N94-30373
Algorithmic problems concerning first-order definability of modal formulas on the class of all finite frames
[ML-93-07] p 3456 N94-30383
VAS: A Vision Advisor System combining agents and object-oriented databases
[AIAA PAPER 94-1181-CP] p 3440 N94-30532
Building brains for bodies
[AIAA PAPER 94-1208-CP] p 3444 N94-30559
Predictive sufficiency and the use of stored internal state
[AIAA PAPER 94-1213-CP] p 3445 N94-30564
Using generic tool kits to build intelligent systems
[AIAA PAPER 94-1214-CP] p 3445 N94-30565
The road plan model: Information model for planning road building activities
[AIAA PAPER 94-1219-CP] p 3445 N94-30567
An intelligent robotic aid system for human services
[AIAA PAPER 94-1232-CP] p 3447 N94-30580
A Modular Artificial Intelligence Inference Engine System (MAIS) for support of on orbit experiments
[AIAA PAPER 94-1237-CP] p 3448 N94-30584
Service independent building blocks-1: Concepts, examples and formal specifications
[CWI-CS-R9326] p 3448 N94-30731
Multi-sensor data fusion and the use of artificial intelligence
[PB94-126216] p 3448 N94-30741

ARTIFICIAL SATELLITES

Communications subsystem for the Petite Amateur Navy Satellite (PANSAT)
[AD-A275532] p 3242 N94-28812
Satellites: Reliability and operation security
[REPT-932-440-108] p 3168 N94-29419

ASPHALT

Asphaltic concrete performance under heavy fighter aircraft loading
[AD-A275046] p 3157 N94-29151

ASSAYING

Tropospheric HO determination by FAGE p 3342 N94-28590
Computerized in vitro test for chemical toxicity based on tetrahymena swimming patterns p 3354 N94-30463

ASSEMBLING

Integration of a path generation algorithm into off-line programming of airbus panels
[REPT-932-600-103] p 3435 N94-29480

ASSEMBLY

Application of the Modular Automated Reconfigurable Assembly System (MARAS) concept to adaptable vision gauging and parts feeding
[AIAA PAPER 94-1182-CP] p 3440 N94-30533

ASSESSMENTS

Identification of components to optimize improvement in system reliability
[DE94-001601] p 3315 N94-28503

ASSIMILATION

Four-dimensional data assimilation using the adjoint method p 3455 N94-30353

ASTIGMATISM

Aberrated point-spread functions and beam quality for optical systems with annular pupils
[AD-A275311] p 3499 N94-28875

ASTROMETRY

Toward astrometric tracking with the infrared spatial interferometer p 3249 N94-29653
The angular two-point correlation function of galaxies down to 25th mag p 3547 N94-30010

ASTRONAUT PERFORMANCE

Space and vertigo: In relation to space motion sickness p 3390 N94-28857
Tactility as a function of grasp force: Effects of glove, orientation, pressure, load, and handle
[NASA-TP-3474] p 3402 N94-30210

ASTRONOMICAL INTERFEROMETRY

A sounding rocket program in extreme and far ultraviolet interferometry
[NASA-CR-195114] p 3289 N94-29907

ASTRONOMICAL MODELS

The role of cloud collisions in N-body simulations of disk galaxies p 3545 N94-29755
The effects of relativistic neutrons on nonthermal models of active galactic nuclei p 3547 N94-29993
The second coming of cold dark matter?
[DE94-004992] p 3548 N94-30694

ASTRONOMICAL OBSERVATORIES

Remote observatory access via the advanced communications technology satellite p 3253 N94-29894

ASTRONOMICAL PHOTOGRAPHY

Reconstruction of stellar images from correlations
[ISBN-0-315-85382-4] p 3541 N94-30133

ASTRONOMICAL PHOTOMETRY

Globular cluster photometry near the turnoff: Blue stragglers, relative ages, and the horizontal branch p 3536 N94-29732
The cataclysmic variables from the Palomar-Green survey p 3539 N94-29819

ASTRONOMICAL SPECTROSCOPY

Backscatter Mossbauer Spectrometer (BaMS) for extraterrestrial applications p 3236 N94-29774
Camera artifacts in IUE spectra
[NASA-CR-189337] p 3198 N94-29857
Coronal abundances and their variation
[NASA-CR-195767] p 3551 N94-29858
Spatially resolved spectroscopy of AG Carinae, and direct evidence for stellar evolution: The central star of NGC 2392
[NASA-CR-189291] p 3545 N94-29871
Pushing the limit: Precision radial velocities, techniques, and applications p 3542 N94-30861

ASTRONOMY

CBSD: The celestial background scene descriptor
[AD-A275521] p 3538 N94-28671
Finnish astronomy days, 1992-1993. Proceedings of the Finnish Astronomical Society
[PB94-136892] p 3538 N94-29170

ASTROPHYSICS

Physics, astronomy, and astrophysics: A numerical study of the black hole plus Brill wave spacetime p 3540 N94-29990

ASYMMETRY

Hierarchical structures and asymmetric stochastic processes on p-adics and adeles
[PB94-138203] p 3464 N94-29178

ASYMPTOTIC GIANT BRANCH STARS

Abundance patterns in red-giant CH stars p 3539 N94-29820

ASYMPTOTIC METHODS

Numerical solution of the multichannel scattering problem
[DE94-606297] p 3484 N94-28619
Long-wavelength asymptotics of unstable crossflow modes, including the effect of surface curvature
[NASA-CR-4579] p 3273 N94-29460
An asymptotic analysis for compressible gas lubrication of rough surfaces p 3222 N94-30922

ASYMPTOTIC PROPERTIES

Asymptotic coherence of gluons and of q-bosons
[DE94-005417] p 3481 N94-28492
Stochastic stability and nonlinear control in mechanical systems p 3303 N94-29966
Dissipation in Hamiltonian systems: Decaying cnoidal waves
[MEMO-1151] p 3460 N94-30738

ASYMPTOTIC SERIES

Higher order asymptotic crack tip fields in a power-law hardening material p 3321 N94-29829

ASYNCHRONOUS MOTORS

Electrical engineering and industrial electronics education days: Control of asynchronous generators
[PB94-135514] p 3266 N94-29523

ATLANTIC OCEAN

The velocity field in the Northeast Atlantic from satellite-tracked drifting buoys
[AD-A275704] p 3376 N94-28690
Studies of marine aerosols and their evolution in the eastern North Atlantic
[AD-A275011] p 3377 N94-29128

ATMOSPHERIC ATTENUATION

Optical modeling of visibility and visibility instrumentation using stratified Mie theory p 3348 N94-29750
Adaptive power control as a fade countermeasure on satellite links p 3253 N94-29897
Atmospheric Propagation Effects Through Natural and Man-Made Obscurants for Visible to MM-Wave Radiation
[AGARD-CP-542] p 3256 N94-30495
Evaluation of dual polarization attenuation of millimeter frequencies through a meteorological radar p 3256 N94-30496
Propagation modeling of moist air and suspended water/ice particles at frequencies below 1000 GHz p 3256 N94-30497
Multispectral transmittance measurements through man-made water fogs p 3257 N94-30499

ATMOSPHERIC BOUNDARY LAYER

Papers in meteorology and geophysics, vol. 44, no.1
[JTN-94-80585] p 3324 N94-28693
Structure of neutrally stratified turbulent Ekman layer as predicted by closure models with prognostic equation for master length scale p 3325 N94-28696
US National Weather experiment STORM-FEST: Waves and turbulence in frontal zones
[AD-A275084] p 3369 N94-28847
SAR-related stress variability in the Marine Atmospheric Boundary Layer (MABL)
[AD-A275275] p 3377 N94-29436
An observational and numerical study of sea/land-breeze circulations in an area of complex coastal heating p 3372 N94-29813
Large eddy simulation of the upper atmospheric surface layer
[ISBN-0-315-85393-X] p 3365 N94-30134

ATMOSPHERIC CHEMISTRY

Ozone production at a rural site in Georgia during the summer 1992 SOS campaign
[DE94-003989] p 3342 N94-28523
Local Measurement of Tropospheric HO(x)
[NASA-CP-3245] p 3342 N94-28587
Two-Photon/Laser-Induced Fluorescence (TP/LIF) sensor p 3342 N94-28588
In situ detection of tropospheric OH and HO2 by laser-induced fluorescence in a detection chamber at low pressure p 3342 N94-28589
Tropospheric HO determination by FAGE p 3342 N94-28590
The radical amplifier p 3345 N94-28604
Lead detection and mapping with reference to relationships between scale, sensor characteristics, surface conditions and atmospheric properties
[AD-A275321] p 3377 N94-28877
Activities report of the International Meteorological Institute
[ETN-94-95524] p 3370 N94-29423
Developing a diode array spectrometer for tropospheric chemistry studies p 3362 N94-29752
Brief summary of accomplishments since our DOE-sponsored radon project commenced
[DE94-004643] p 3348 N94-29926
Impact of biomass burning on the atmosphere
[DE94-004333] p 3349 N94-29954
Atmosphere, ocean, and land: Critical gaps in Earth system models p 3350 N94-30617

ATMOSPHERIC CIRCULATION

Papers in meteorology and geophysics, vol. 44, no.1
[JTN-94-80585] p 3324 N94-28693
US National Weather experiment STORM-FEST: Waves and turbulence in frontal zones
[AD-A275084] p 3369 N94-28847
On the origins of low-level tornadic circulations within the remnants of hurricane Andrews
[AD-A275373] p 3369 N94-29011
Hydrodynamics of convection under winter polar leads
[AD-A275182] p 3369 N94-29067
Boundary layer coherent structures
[AD-A275007] p 3272 N94-29195
Study of dynamic characteristics of a monsoon circulation tube
[AD-A275238] p 3370 N94-29394
Activities report of the International Meteorological Institute
[ETN-94-95524] p 3370 N94-29423

Radar estimations of atmospheric winds in the troposphere and lower stratosphere
p 3370 N94-29697
A study of the thermospheric dynamics of the high-latitude E region using a spectral thermospheric general circulation model p 3362 N94-29743
GCM studies of the influence of vegetation on the general circulation: The role of albedo in modulating climate change p 3348 N94-29749
Downstream development of baroclinic waves
p 3372 N94-29796
An observational and numerical study of sea/land-breeze circulations in an area of complex coastal heating p 3372 N94-29813
On interannual variability and climate change in the North Pacific p 3374 N94-29963
Use of satellite data to improve parameterization of spatial and temporal variations of gaseous dry deposition in regional-scale models
[DE94-005110] p 3334 N94-30022
Generation mechanisms of quasi-stationary waves in the Southern Hemisphere p 3365 N94-30789
Complex source rate estimation for atmospheric transport and dispersion models
[DE94-000958] p 3354 N94-30822
Multiple weather regimes and baroclinically forced spherical resonance
[DM-65] p 3376 N94-30966

ATMOSPHERIC COMPOSITION
On eddy accumulation with limited conditional sampling to measure air-surface exchange
[DE94-005112] p 3368 N94-28568
Detection of tropospheric OH and HO2 by laser-induced fluorescence at low pressure using the 308nm excitation of OH p 3343 N94-28591
Harvard ER-2 OH laser-induced fluorescence instrument p 3343 N94-28592
JPL Fourier transform ultraviolet spectrometer
p 3343 N94-28593
Absolute determination of local tropospheric OH concentrations p 3343 N94-28594
UV laser long-path absorption spectroscopy
p 3343 N94-28595
Measurement of tropospheric OH by laser long-path absorption spectroscopy p 3343 N94-28596
On the possibility of measuring atmospheric OH using intracavity laser spectroscopy p 3344 N94-28597
Measurement of atmospheric OH by titration of near-IR fluorescent dyes p 3344 N94-28599
The radiocarbon hydroxyl technique
p 3344 N94-28600
Ion-assisted tropospheric OH measurement technique
p 3344 N94-28601
Tropospheric HO2 determination by FAGE
p 3345 N94-28606
A fractal analysis of near-field atmospheric concentration data
[AD-A275460] p 3355 N94-28728
On the effect of emissions from aircraft engines on the state of the atmosphere p 3189 N94-29247
GOME: Global Ozone Monitoring Experiment
[ESA-SP-1151] p 3347 N94-29452
Laboratory studies of chemical and photochemical processes relevant to stratospheric ozone
[NASA-CR-195779] p 3347 N94-29549
Developing a diode array spectrometer for tropospheric chemistry studies p 3362 N94-29752
Use of satellite data to improve parameterization of spatial and temporal variations of gaseous dry deposition in regional-scale models
[DE94-005110] p 3334 N94-30022
The far-infrared absorption spectrum of low temperature hydrogen gas
[ISBN-0-315-85432-4] p 3199 N94-30137
The carbon cycle revisited p 3350 N94-30622
Ocean-atmospheric linkages p 3350 N94-30623
Linkages between terrestrial ecosystems and the atmosphere p 3351 N94-30624
Carbon cycling in high-latitude ecosystems
p 3352 N94-30631
Models of atmosphere-ecosystem-hydrology interactions: Approaches and testing
p 3353 N94-30636
Evaluating models of climate and forest vegetation
p 3353 N94-30637
The development and evaluation of a tunable diode laser trace gas sensor for the measurement of N2O and CH4 fluxes using micrometeorological techniques
[ISBN-0-315-78975-1] p 3296 N94-30801
The validation of ocean surface heat fluxes in AMIP
[DE94-001539] p 3378 N94-30823
The long-range transport of aerosol particles over the North Atlantic Ocean p 3366 N94-30867

ATMOSPHERIC CORRECTION
Spectral and polarimetric analysis of hyperspectral data collected by an acousto-optic tunable filter system
[AD-A275076] p 3329 N94-29095
Tropospheric corrections to GPS measurements using locally measured meteorological parameters compared with general tropospheric corrections
p 3144 N94-30655
Ionospheric corrections to precise time transfer using GPS p 3145 N94-30677
New perspectives for high accuracy SLR with second generation geodesic satellites
[REPT-932-440-105] p 3336 N94-30965

ATMOSPHERIC DIFFUSION
A fractal analysis of near-field atmospheric concentration data
[AD-A275460] p 3355 N94-28728

ATMOSPHERIC EFFECTS
Line-of-sight tropospheric calibration from measurements in arbitrary directions
p 3249 N94-29654
Atmospheric Propagation Effects Through Natural and Man-Made Obscurants for Visible to MM-Wave Radiation
[AGARD-CP-542] p 3256 N94-30495
Model for the simulation of atmospheric effects on targets to background passive signatures
p 3258 N94-30507
The carbon cycle revisited p 3350 N94-30622

ATMOSPHERIC ELECTRICITY
A study of cloud-to-ground lightning processes with emphasis on data analysis and modeling of the return stroke p 3372 N94-29802

ATMOSPHERIC ENTRY
Parachute Swivel Mechanism for planetary entry
p 3162 N94-29643

ATMOSPHERIC GENERAL CIRCULATION MODELS
Global atmospheric and ocean modeling on the connection machine
[DE94-003930] p 3342 N94-28521
A study of the thermospheric dynamics of the high-latitude E region using a spectral thermospheric general circulation model p 3362 N94-29743
GCM studies of the influence of vegetation on the general circulation: The role of albedo in modulating climate change p 3348 N94-29749
Sensitivity and feedbacks associated with vegetation-related land surface parameters in a general circulation model p 3348 N94-29800
PCCM2: A GCM adapted for scalable parallel computers
[DE94-005113] p 3350 N94-30116
Generation mechanisms of quasi-stationary waves in the Southern Hemisphere p 3365 N94-30789
The validation of ocean surface heat fluxes in AMIP
[DE94-001539] p 3378 N94-30823

ATMOSPHERIC HEATING
Cryosphere and climate p 3352 N94-30632
The challenge of identifying greenhouse gas-induced climatic change p 3352 N94-30634

ATMOSPHERIC MODELS
Global change research: Summaries of research in FY 1993
[DE94-003150] p 3341 N94-28473
Global atmospheric and ocean modeling on the connection machine
[DE94-003930] p 3342 N94-28521
The active titration method for measuring local hydroxyl radical concentration p 3345 N94-28602
A global forecast model comparison study - year 1
[AD-A275674] p 3369 N94-28663
CBSD: The celestial background scene descriptor
[AD-A275521] p 3538 N94-28671
Structure of neutrally stratified turbulent Ekman layer as predicted by closure models with prognostic equation for master length scale p 3325 N94-28696
A fractal analysis of near-field atmospheric concentration data
[AD-A275460] p 3355 N94-28728
Numerical simulations of a mountain thunderstorm. A comparison with Doppler radar observations
[AD-A275296] p 3369 N94-28873
Lead detection and mapping with reference to relationships between scale, sensor characteristics, surface conditions and atmospheric properties
[AD-A275321] p 3377 N94-28877
SHARC, a model for calculating atmospheric and infrared radiation under non-equilibrium conditions
[AD-A275207] p 3357 N94-28893
Monte Carlo simulation or normal shock wave. Part 2: VHS model and VSS model p 3123 N94-28948
Variable soft sphere molecular model in the Monte Carlo simulation of air species p 3123 N94-28949
Rarefied gas numerical wind tunnel. Part 8: HOPE
p 3123 N94-28950
Role of satellite observations of sea-surface temperature in the detection of global change
[PB94-138120] p 3329 N94-29107
Error growth in poor ECMWF forecasts over the contiguous United States
[AD-A275297] p 3369 N94-29183
Prototype terminal aerodrome forecasts using a mesoscale model
[AD-A275308] p 3369 N94-29194
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, no. 6
[JTN-94-80593] p 3359 N94-29233
A theory of current generator in the magnetosphere-ionosphere coupling
p 3360 N94-29240
Evaluation of the National Meteorological Center mesoscale model for prediction of severe convection over Central Arizona p 3371 N94-29744
Physical processes associated with variability in successive operational model forecasts of cyclogenesis
[ISBN-0-315-74753-6] p 3371 N94-29751
On the annual cycle of the tropical Pacific atmosphere and ocean p 3371 N94-29763
A study of cloud-to-ground lightning processes with emphasis on data analysis and modeling of the return stroke p 3372 N94-29802
The incorporation and initialization of cloud water/ice in an operational forecast model p 3373 N94-29814
Large eddy simulation of the upper atmospheric surface layer
[ISBN-0-315-85393-X] p 3365 N94-30134
Modeling the Earth System, volume 3
[NASA-CR-194256] p 3350 N94-30616
Atmosphere, ocean, and land: Critical gaps in Earth system models p 3350 N94-30617
Land surface interaction p 3350 N94-30621
Modeling Earth system changes of the past
p 3353 N94-30635
Comprehensive system models: Strategies for evaluation p 3353 N94-30638
Complex source rate estimation for atmospheric transport and dispersion models
[DE94-000958] p 3354 N94-30822
Computing at the leading edge: Research in the energy sciences
[DE94-006121] p 3563 N94-30844
Modeling studies of frontogenesis in the upper and middle troposphere p 3375 N94-30868
Tropospheric radiative forcing of O3 for the 1994 IPCC report
[DE94-005698] p 3367 N94-30876
Multiple weather regimes and baroclinically forced spherical resonance
[DM-65] p 3376 N94-30966

ATMOSPHERIC MOISTURE
Test of prototype liquid-water-content meter for aircraft use
[NASA-CR-189304] p 3374 N94-30187
Propagation modeling of moist air and suspended water/ice particles at frequencies below 1000 GHz
p 3256 N94-30497
The influence of the evaporation duct on the angle of arrival and amplitude of the backscattered signal from targets low above the sea p 3256 N94-30498
Multispectral transmittance measurements through man-made water fogs p 3257 N94-30499
Radiation transport in cloudy and aerosol loaded atmospheres p 3366 N94-30805
Atmospheric moisture fields derived by satellite observations over the tropical Pacific Ocean
p 3375 N94-30863
Atmospheric turbulence within and above a coniferous forest
[ISBN-0-315-75468-0] p 3375 N94-30870

ATMOSPHERIC OPTICS
The appearance of the Sun and Moon seen through clouds
[AD-A275336] p 3551 N94-29212
Toward astrometric tracking with the infrared spatial interferometer p 3249 N94-29653
Optical modeling of visibility and visibility instrumentation using stratified Mie theory p 3348 N94-29750
Atmospheric Propagation Effects Through Natural and Man-Made Obscurants for Visible to MM-Wave Radiation
[AGARD-CP-542] p 3256 N94-30495
Estimation of transmittance from satellite imagery
p 3257 N94-30500

ATMOSPHERIC PHYSICS
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, no. 6
[JTN-94-80593] p 3359 N94-29233
A theory of current generator in the magnetosphere-ionosphere coupling
p 3360 N94-29240

Study of generation mechanisms of magnetospheric VLF/ELF emissions based on the direction findings p 3361 N94-29245
Activities report of the International Meteorological Institute
[ETN-94-95524] p 3370 N94-29423
Physical processes associated with variability in successive operational model forecasts of cyclogenesis
[ISBN-0-315-74753-6] p 3371 N94-29751

ATMOSPHERIC PRESSURE
Synthesis and neutron diffraction study of Na3WN3 and Na3MoN3
[AD-A275158] p 3203 N94-29043
Plasma heating for containerless and microgravity materials processing
[NASA-CASE-NPO-18819-1-CU] p 3229 N94-29371
Micro-sensors for in-situ meteorological measurements p 3236 N94-29777

ATMOSPHERIC RADIATION
The automated rotating shadowband spectroradiometer
[DE94-001878] p 3269 N94-28464
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, no. 6
[JTN-94-80593] p 3359 N94-29233
ULF waves and magnetic field characteristics in the polar cusp observed at Godhavn p 3361 N94-29244
Atmospheric moisture fields derived by satellite observations over the tropical Pacific Ocean p 3375 N94-30863

ATMOSPHERIC REFRACTION
The influence of the evaporation duct on the angle of arrival and amplitude of the backscattered signal from targets low above the sea p 3256 N94-30498

ATMOSPHERIC SCATTERING
Atmospheric Propagation Effects Through Natural and Man-Made Obscurants for Visible to MM-Wave Radiation
[AGARD-CP-542] p 3256 N94-30495
The influence of the evaporation duct on the angle of arrival and amplitude of the backscattered signal from targets low above the sea p 3256 N94-30498
Radiation transport in cloudy and aerosol loaded atmospheres p 3366 N94-30805

ATMOSPHERIC SOUNDING
On the possibility of measuring atmospheric OH using intracavity laser spectroscopy p 3344 N94-28597
An improved method of measuring tropospheric NO2, NO3, HO2, and RO2 by Matrix Isolation and Electronic Spin Resonance (MIESR) p 3345 N94-28605
Near-IR diode laser absorption for measurement of tropospheric HO2 p 3345 N94-28607
Research trends on remote sensing at research facilities in Japan: The priority area programme on better understanding of earth environment via satellite p 3326 N94-28928
Activities of the wintering party at Showa Station by the 31st Japanese Antarctic Research Expedition in 1990 p 3358 N94-29083
Activities of the fourth wintering party at Asuka Station by the 31st Japanese Antarctic Research Expedition in 1990 p 3358 N94-29084
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, no. 6
[JTN-94-80593] p 3359 N94-29233
Time series comparisons of satellite and rocketsonde temperatures in 1978-1979
[NASA-TP-3409] p 3370 N94-29455
Inter-comparison of Wildfire and High-resolution Interferometer Sounder (HIS) data from STORM-FEST: An investigation of wildfire spectral channel discrepancies
[NASA-TM-108439] p 3333 N94-29553
Data transfer system using a multi-ID ARGOS transmitter for the Antarctic polar patrol balloon experiment p 3363 N94-29980
Remote sensor observations during WISP91: The use of microwave radiometers, RASS, and lidar ceilometers for detection of aircraft icing conditions
[PB94-142106] p 3136 N94-30890

ATMOSPHERIC STRATIFICATION
Structure of neutrally stratified turbulent Ekman layer as predicted by closure models with prognostic equation for master length scale p 3325 N94-28696

ATMOSPHERIC TEMPERATURE
Prediction of survival times on land in a cold climate p 3379 N94-28423
Objective analysis of a coastal ocean eddy using satellite AVHRR and in situ hydrographic data
[AD-A275715] p 3376 N94-28642
SHARC, a model for calculating atmospheric and infrared radiation under non-equilibrium conditions
[AD-A275207] p 3357 N94-28893
On the temperature distribution near a cold surface
[AD-A275162] p 3332 N94-29288
Time series comparisons of satellite and rocketsonde temperatures in 1978-1979
[NASA-TP-3409] p 3370 N94-29455
Second Japan-U.S. Workshop on Global Change: Environmental Response Technologies for Global Change (Mitigation and Adaptation) p 3354 N94-29522
Global patterns of cloud optical thickness variation with temperature and the implications for climate change p 3374 N94-29972
The challenge of identifying greenhouse gas-induced climatic change p 3352 N94-30634
Spatial interpolation, network bias, and terrestrial air temperature variability p 3374 N94-30810
Atmospheric turbulence within and above a coniferous forest
[ISBN-0-315-75468-0] p 3375 N94-30870

ATMOSPHERIC TURBULENCE
New parameters for characterizing turbulence at a potential wind site
[DE94-004355] p 3368 N94-28455
On eddy accumulation with limited conditional sampling to measure air-surface exchange
[DE94-005112] p 3368 N94-28568
A fractal analysis of near-field atmospheric concentration data
[AD-A275460] p 3355 N94-28728
US National Weather experiment STORM-FEST: Waves and turbulence in frontal zones
[AD-A275084] p 3369 N94-28847
An observational and numerical study of sea/land-breeze circulations in an area of complex coastal heating p 3372 N94-29813
Calculation of turbulence degraded point spread function of an imaging system p 3260 N94-30514
Modeling studies of frontogenesis in the upper and middle troposphere p 3375 N94-30868
Atmospheric turbulence within and above a coniferous forest
[ISBN-0-315-75468-0] p 3375 N94-30870

ATOMIC BEAMS
Surface structure and stereochemical properties of self-assembled monolayer materials
[DE94-004960] p 3484 N94-28578
Computer simulation of the interaction of fast hydrogen atoms with a molybdenum containing sorbed hydrogen
[DE94-608419] p 3209 N94-30253

ATOMIC CLOCKS
The 25th Annual Precise Time and Time Interval (PTTI) Applications and Planning Meeting
[NASA-CP-3267] p 3468 N94-30639
Two-way satellite time transfer: Overview and recent developments p 3469 N94-30646
Optical techniques for time and frequency transfer p 3469 N94-30647
GPS common-view time transfer p 3144 N94-30648
A real-time prediction of UTC p 3470 N94-30654
Accuracy metrics for judging time scale algorithms p 3471 N94-30656
Comparison of LASSO and GPS time transfers p 3145 N94-30665
An algorithm for the Italian atomic time scale p 3473 N94-30668
A comparative study of clock rate and drift estimation p 3473 N94-30669
A look into the crystal ball: The next 25 years p 3475 N94-30681

ATOMIC EXCITATIONS
Asymptotic coherence of gluons and of q-bosons
[DE94-005417] p 3481 N94-28492

ATOMIC FORCE MICROSCOPY
Atomic-scale friction measurements using friction force microscopy. Part 2: Application to magnetic media
[AD-A275202] p 3298 N94-29290

ATOMIC PHYSICS
Atomic physics with highly charged ions
[DE94-003397] p 3492 N94-30837

ATOMIC STRUCTURE
Electronic structure and mechanical properties of grain boundaries
[AD-A275198] p 3512 N94-28890
Structure of ordinary ice I(sub h). Part 1: Ideal structure of ice
[AD-A275149] p 3486 N94-29021
Halogen chemisorption on silver(111): Scanning tunneling microscopy of coadsorbed halogen atoms
[AD-A275219] p 3486 N94-29060
Atomic and magnetic structure of YBa2(Cu(1-x)Fe(x))3O(6+y) at 0.05 less than or equal to x less than or equal to 0.30, y is approximately equal to 1 and y is approximately equal to 0.5
[DE94-606852] p 3513 N94-29210
Theoretical investigation of gas-surface interactions
[NASA-CR-195755] p 3272 N94-29378
The MSRC ab initio methods benchmark suite: A measurement of hardware and software performance in the area of electronic structure methods
[DE94-006428] p 3514 N94-30001
Influence of doping on the electronic structure of (La, Sr)2CuO4
[DE94-006383] p 3516 N94-30054
Electronic structure of Zn-based quantum wells
[DE94-608104] p 3516 N94-30068
Generalized augmented space theorem for correlated disorder and cluster coherent potential approximation
[DE94-608110] p 3208 N94-30118
On the structure and atomic motions in liquid sodium
[DE94-608386] p 3490 N94-30182
Overlap of metal clusters and nuclear structure physics
[DE94-608387] p 3517 N94-30183
Nonlinear optics response of semiconductor quantum wells under high magnetic fields
[DE94-003244] p 3520 N94-30835
RHEED studies of the nucleation, growth, and mobility of Ag atoms on the Si(111)7 x 7 surface
[DE94-005551] p 3521 N94-30899
Thermochemical data for CVD modeling from ab initio calculations
[DE94-005269] p 3222 N94-30909

ATOMIZERS
Experimental studies on effervescent atomizers with wide spray angles p 3196 N94-29280
Investigation of the two-phase flow in a research combustor under reacting and non-reacting conditions p 3196 N94-29282

ATOMIZING
Experimental studies on effervescent atomizers with wide spray angles p 3196 N94-29280
Centrifugal atomization of lanthanide materials for cryogenic coolers
[DE94-006035] p 3219 N94-30337

ATOMS
On the structure and atomic motions in liquid sodium
[DE94-608386] p 3490 N94-30182
Research on the atomic layer-by-layer growth of high-temperature superconductor thin films at the Institute of Scientific and Industrial Research, Japan
[DE94-003739] p 3519 N94-30611

ATROPHY
Leg muscle volume during 30-day 6-degree head-down bed rest with isotonic and isokinetic exercise training
[NASA-TM-4580] p 3385 N94-29401
Shortening velocity and calcium sensitivity of single fibers from hindlimb suspended muscle in rats p 3387 N94-29866

ATTENTION
Maintaining vigilance on a simulated ATC monitoring task across repeated sessions
[DOT/FAA/AM-94/6] p 3143 N94-30933

ATTITUDE (INCLINATION)
Japanese Journal of Aerospace and Environmental Medicine, volume 30, no. 1
[JTN-94-80598] p 3389 N94-28850
Effect of food intake on skin vasomotor responses to head-up tilt in humans p 3390 N94-28854
The influence of appendage vibration on the attitude dynamics of a dual-spin satellite p 3168 N94-29828

ATTITUDE CONTROL
Software engineering methods in the Hermes on-board software p 3414 N94-29326
A gimbaled low noise momentum wheel p 3162 N94-29640
Posture control of goldfishes under microgravity p 3387 N94-29712
Miniature wide field-of-view star trackers for spacecraft attitude sensing and navigation p 3144 N94-29794

ATTITUDE INDICATORS
A comparison of three aircraft attitude display symbology structures
[AD-A275172] p 3150 N94-29048

ATTITUDE STABILITY
The influence of appendage vibration on the attitude dynamics of a dual-spin satellite p 3168 N94-29828

AUDIO EQUIPMENT
Multi-channel spatialization systems for audio signals
[NASA-CASE-ARC-12013-1-CU] p 3245 N94-29364

AUDIO SIGNALS
Data fusion and correlation techniques testbed development audio processing study
[SKD-1600-73-014] p 3241 N94-28532
Multi-channel spatialization systems for audio signals
[NASA-CASE-ARC-12013-1-CU] p 3245 N94-29364

AUDIOMETRY
Evaluation of monitoring audiometry in the United States Air Force Hearing Conservation Program
[AD-A275309] p 3391 N94-29211
Index of NPL acoustics publications 1981-1990
[NPL-RSA(EXT)-0044] p 3480 N94-30786

AUDITORY PERCEPTION
Subjective response to sonic booms having different shapes, rise times, and durations
[NASA-TM-109090] p 3479 N94-29464
AUDITORY SIGNALS
Noise reduction techniques for the restoration of musical recordings
[TELECOM-93-E-019] p 3291 N94-30979
AURORAL ABSORPTION
Initial observation results with imaging riometer at NY-Alesund (L is equal to 16) p 3360 N94-29239
AURORAL ECHOES
Long term variations of radio auroral activity p 3359 N94-29237
New-type echoes observed with the 50 MHz auroral Doppler radar at Showa Station p 3360 N94-29238
AURORAL IRRADIATION
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, no. 6
[JTN-94-80593] p 3359 N94-29233
Aurora stereo observation in Iceland p 3359 N94-29234
Long term variations of radio auroral activity p 3359 N94-29237
New-type echoes observed with the 50 MHz auroral Doppler radar at Showa Station p 3360 N94-29238
AURORAL ZONES
The effects of magnetic storm phases on F-layer irregularities from auroral to equatorial latitudes
[AD-A275203] p 3356 N94-28891
AURORAS
Space-time structure of the morning aurora inferred from coincident DMSP-F6, -F8, and Sondrestrom incoherent scatter radar observations
[AD-A275442] p 3356 N94-28869
Aurora stereo observation in Iceland p 3359 N94-29234
Long term variations of radio auroral activity p 3359 N94-29237
New-type echoes observed with the 50 MHz auroral Doppler radar at Showa Station p 3360 N94-29238
Initial observation results with imaging riometer at NY-Alesund (L is equal to 16) p 3360 N94-29239
A theory of current generator in the magnetosphere-ionosphere coupling p 3360 N94-29240
Scale-length dependence of the ratio between the magnetic and electric field perturbations in the ionospheric field-aligned current region p 3360 N94-29243
Observation of Jovian auroral Ly-alpha line profile and emission variability with a sounding rocket and the IUE archives p 3550 N94-30798
AUSTENITE
Analysis of data by long-time mechanical properties of 08KH18N10T steel irradiated by neutrons
[DE94-605337] p 3202 N94-28551
Toughening mechanisms in ultrahigh-strength steels
[AD-A275439] p 3202 N94-28867
AUSTENITIC STAINLESS STEELS
Joining silicon carbide to austenitic stainless steel through diffusion welding
[PB94-126331] p 3297 N94-28399
Relationship between swelling and irradiation creep in cold-worked PCA stainless steel irradiated to approximately 178 dpa at approximately 400 C
[DE94-004368] p 3201 N94-28456
AUSTIN COMET
Infrared observations of cometary dust by COBE p 3541 N94-29994
AUTOMATA THEORY
Partial support for the Second International Symposium on Artificial Intelligence and Mathematics
[AD-A275199] p 3434 N94-29026
Dynamics of defect ensembles in one-dimensional cellular automata
[PB94-136819] p 3464 N94-29030
On-line search for optimal controller parameters using interconnected learning automata
[MATHS-REPT-A-196] p 3436 N94-29526
Some methodological issues about designing autonomous agents which learn their behaviors: The ELF experience
[REPT-93-068] p 3449 N94-30939
AUTOMATED RADAR TERMINAL SYSTEM
Machine Intelligence in Air Traffic Management
[AGARD-CP-538] p 3136 N94-29558
AUTOMATIC CONTROL
The state transition diagram with path priority and it's applications
[AD-A275524] p 3434 N94-28672
Partial support for the Second International Symposium on Artificial Intelligence and Mathematics
[AD-A275199] p 3434 N94-29026
A concurrent, object-based implementation for the tactical level of the rational behavior model
[AD-A275024] p 3410 N94-29115
Reactive system software concept with automation using the LDS language p 3414 N94-29327
Automation of the NDT diagnostic using neural nets. Application: Inspection of Airbus longitudinal joints during maintenance
[REPT-932-600-104] p 3315 N94-29474
Welding wire pressure sensor assembly
[NASA-CASE-MFS-26216-1-SB] p 3300 N94-29506
Intelligent systems for air space control and management p 3137 N94-29560
Use of GPS in automated air traffic control p 3137 N94-29563
Design of Center-TRACON Automation System p 3138 N94-29568
Simulation of fully automated air traffic control concepts p 3139 N94-29569
ARC2000: Automatic radar control p 3141 N94-29583
Automatic control steps for aircraft taxi guidance p 3141 N94-29584
Control system design for A and R supported microgravity experiments: An experiment payload control development
[AD-B179107] p 3229 N94-30421
The use of interactive computer vision and robot hand controllers for enhancing manufacturing safety p 3314 N94-30442
Programmable Automated Welding System (PAWS): Control of welding through software and hardware p 3314 N94-30443
Task-level control for autonomous robots
[AIAA PAPER 94-1210-CP] p 3444 N94-30561
Using generic tool kits to build intelligent systems
[AIAA PAPER 94-1214-CP] p 3445 N94-30565
A reactive system for open terrain navigation: Performance and limitations
[AIAA PAPER 94-1218-CP] p 3445 N94-30566
The road plan model: Information model for planning road building activities
[AIAA PAPER 94-1219-CP] p 3445 N94-30567
Programmable Automated Welding System (PAWS)
[AIAA PAPER 94-1221-CP] p 3446 N94-30570
AUTOMATION
Reactive system software concept with automation using the LDS language p 3414 N94-29327
Conference on Intelligent Robotics in Field, Factory, Service, and Space (CIRFFSS 1994), volume 1
[NASA-CP-3251] p 3439 N94-30526
Task automation in a successful industrial telerobot
[AIAA PAPER 94-1189-CP] p 3441 N94-30539
The Automated Aircraft Rework System (AARS): A system integration approach
[AIAA PAPER 94-1225-CP] p 3446 N94-30574
Automated inspection of turbine blades: Challenges and opportunities
[AIAA PAPER 94-1226-CP] p 3446 N94-30575
AUTOMOBILE FUELS
Technical analysis of alternative fueled vehicles
[DE94-744238] p 3304 N94-30269
TCM exemptions to promote alternative-fuel vehicles: The good, the bad, and the ugly
[DE94-005924] p 3311 N94-30703
Fuel cycle evaluations of biomass-ethanol and reformulated gasoline
[DE94-000227] p 3226 N94-30818
Investigation of the technology development status of alternate fuel vehicles
[DE94-744237] p 3312 N94-30831
Compressed natural gas fueled vehicles: The Houston experience
[DE94-005804] p 3312 N94-30878
AUTOMOBILES
Technical analysis of alternative fueled vehicles
[DE94-744238] p 3304 N94-30269
Vehicle following controller design for autonomous intelligent vehicles
[AIAA PAPER 94-1203-CP] p 3443 N94-30554
Proceedings of the 1993 Windsor Workshop on Alternative Fuels
[DE94-003908] p 3226 N94-30612
Design of a variable-conductance vacuum insulation
[DE94-000270] p 3268 N94-30819
Investigation of the technology development status of alternate fuel vehicles
[DE94-744237] p 3312 N94-30831
AUTOMORPHISMS
Remarks on Galois symmetry in RCFT
[PB94-138179] p 3467 N94-29147
AUTONOMIC NERVOUS SYSTEM
Analysis of various biological activity parameters during parabolic flight p 3393 N94-29716
AUTONOMOUS NAVIGATION
A concurrent, object-based implementation for the tactical level of the rational behavior model
[AD-A275024] p 3410 N94-29115
Object oriented design of the autonomous fixtaking management system p 3143 N94-29323
Proceedings of the 3rd Conference on Military Robotic Applications
[DRES-SP-149] p 3304 N94-30275
Autonomous intelligent military robots: Army ants, killer bees, and cybernetic soldiers p 3304 N94-30276
The NRC mobile robot project p 3305 N94-30280
Extended occupancy grid method for modelling unknown dynamic environments p 3144 N94-30281
Navigation of military and space unmanned ground vehicles in unstructured terrains p 3144 N94-30282
A generic semi-autonomous ground vehicle control system p 3306 N94-30283
Encoding technique for automated guided vehicle POSE recovery in a structured environment p 3144 N94-30286
Obstacle detection for an autonomous vehicle p 3309 N94-30302
Unmanned vehicle mobility: Limits of autonomous navigation p 3310 N94-30311
Design of an autonomous exterior security robot
[AIAA PAPER 94-1188-CP] p 3441 N94-30538
Controlling multiple security robots in a warehouse environment
[AIAA PAPER 94-1300-CP] p 3441 N94-30540
A Space Station robot walker and its shared control software
[AIAA PAPER 94-1192-CP] p 3442 N94-30543
Vision based object pose estimation for mobile robots
[AIAA PAPER 94-1197-CP] p 3442 N94-30548
Perception system and functions for autonomous navigation in a natural environment
[AIAA PAPER 94-1201-CP] p 3443 N94-30552
The real-world navigator
[AIAA PAPER 94-1204-CP] p 3443 N94-30555
Autonomous mobile robot teams
[AIAA PAPER 94-1207-CP] p 3444 N94-30558
A reactive system for open terrain navigation: Performance and limitations
[AIAA PAPER 94-1218-CP] p 3445 N94-30566
Aspects of vision and planning in a dynamic, uncertain environment p 3448 N94-30803
Iterative removal of boundary minima of harmonic potential function for mobile robot navigation
[REPT-93-059] p 3449 N94-30962
AUTONOMOUS SPACECRAFT CLOCKS
Cesium and rubidium frequency standards status and performance on the GPS program p 3145 N94-30663
Comparison of LASSO and GPS time transfers p 3145 N94-30665
AUTONOMY
Achieving robot autonomy p 3310 N94-30307
Vehicle following controller design for autonomous intelligent vehicles
[AIAA PAPER 94-1203-CP] p 3443 N94-30554
A streamlined software environment for situated skills
[AIAA PAPER 94-1205-CP] p 3444 N94-30556
Situational reaction and planning
[AIAA PAPER 94-1206-CP] p 3444 N94-30557
Autonomous mobile robot teams
[AIAA PAPER 94-1207-CP] p 3444 N94-30558
AUXILIARY POWER SOURCES
Advanced steady-state operating scenarios
[DE94-004810] p 3509 N94-30768
AVALANCHES
Physical processes in snowpacks during rain or melt events
[AD-A275445] p 3325 N94-28881
AVIATION METEOROLOGY
Prototype terminal aerodrome forecasts using a mesoscale model
[AD-A275308] p 3369 N94-29194
AVIATION PSYCHOLOGY
Information presentation for expert systems in future fighter aircraft
[AD-A275126] p 3149 N94-29005
AVIONICS
Aerospace Software Engineering for Advanced Systems Architectures
[AGARD-CP-545] p 3412 N94-29315
Experiences with the HOOD design method on avionics software development p 3414 N94-29325
Potential software failures methodology analysis p 3414 N94-29329
Rome Laboratory software engineering technology program p 3414 N94-29330
A common Ada run-time system for avionics software p 3150 N94-29331
Ada run time system certification for avionics applications p 3150 N94-29332
Design of a thinwire real-time multiprocessor operating system p 3415 N94-29333
On ground system integration and testing: A modern approach p 3150 N94-29334

Software testing practices and their evolution for the 1990's p 3415 N94-29335
Validation and test of complex weapon systems p 3150 N94-29336
Testing Operational Flight Programs (OFPs) p 3415 N94-29337
DSSA-ADAGE: An environment for architecture-based avionics development p 3150 N94-29348
Future manned systems advanced avionics study [NASA-CR-188277] p 3150 N94-29377
KC-135 cockpit modernization study and crew reduction feasibility demonstration [AD-A275230] p 3146 N94-29391
DLR's ATM demonstration programme p 3140 N94-29575
Installation of experimental mode-S data link in commercial aircraft [PB94-138757] p 3254 N94-29998

AXIAL FLOW
Local heat transfer in an enclosed corotating disk with axial throughflow p 3276 N94-29849

AXIAL LOADS
A modeling study of the effect of stress state on void linking during ductile fracture [AD-A275505] p 3317 N94-28811
Cyclic axial-torsional deformation behavior of a cobalt-base superalloy [NASA-TM-106372] p 3203 N94-28921
Granular bases for heavily loaded pavements [AD-A275171] p 3156 N94-29047
Failure strength and mechanism of composite laminates under multiaxial loading conditions p 3182 N94-29875
Experimental and analytical comparison of constraint effects due to biaxial loading and shallow-flaws [DE94-004794] p 3323 N94-30689

AXIAL STRAIN
A modeling study of the effect of stress state on void linking during ductile fracture [AD-A275505] p 3317 N94-28811
Cyclic axial-torsional deformation behavior of a cobalt-base superalloy [NASA-TM-106372] p 3203 N94-28921
Finite element analysis of axisymmetric deformations of thick thermoviscoplastic targets p 3320 N94-29688

AXIAL STRESS
Failure strength and mechanism of composite laminates under multiaxial loading conditions p 3182 N94-29875

AXISYMMETRIC FLOW
Forced generation of solitary waves in a rotating fluid and their stability p 3274 N94-29689

AZOLES
Superior energetic materials that contain carbocations and anions. Energetic materials restricted in composition to C, H, N, and O atoms [AD-A275449] p 3225 N94-29310

B

BACILLUS
Physiology and molecular-genetics of thermus and bacillus [PB94-135571] p 3385 N94-29190

BACKGROUND NOISE
Ion-assisted tropospheric OH measurement technique p 3344 N94-28601
Removal of coherent Extremely Low Frequency (ELF) background noise by adaptive noise cancellation [AD-A275016] p 3243 N94-28898
The Rb 780-nanometer Faraday anomalous dispersion optical filter: Theory and experiment p 3250 N94-29659
The effect of enhanced backscattering on target detection p 3258 N94-30508

BACKGROUND RADIATION
CBSD: The celestial background scene descriptor [AD-A275521] p 3538 N94-28671
Camera artifacts in IUE spectra [NASA-CR-189337] p 3198 N94-29857
High redshift QSOs and the x ray background [NASA-CR-195112] p 3540 N94-29957
Energetic events in the early universe p 3547 N94-30012
An absolute measurement of the cosmic background radiation temperature at 1.4 GHz p 3553 N94-30351

BACKSCATTERING
RL/ERCT automated swept-angle bistatic measurement system [AD-A275763] p 3241 N94-28763
Backscatter haze device for measurement of haze in aircraft transparencies [AD-A275127] p 3146 N94-29042
Considerations in the modelling of seafloor acoustic backscatter [AD-A275404] p 3478 N94-29206
Backscatter Mossbauer Spectrometer (BaMS) for extraterrestrial applications p 3236 N94-29774
The influence of the evaporation duct on the angle of arrival and amplitude of the backscattered signal from targets low above the sea p 3256 N94-30498
The effect of enhanced backscattering on target detection p 3258 N94-30508
Polarimetric backscatter measurements of natural surfaces at millimeter wavelengths p 3259 N94-30509
A hybrid electromagnetic-statistical approach for characterizing MMW scattering by terrain p 3259 N94-30510

BACTERIA
Cellular and molecular approaches to polymer synthesis by bacteria [AD-A275501] p 3212 N94-28661
Studies on bacterial spore ultraviolet light resistance and regulation of the activity of a spore protease [AD-A275448] p 3384 N94-28884
Fundamental studies on the corrosion behavior of weldments in marine microbial environments [AD-A275247] p 3203 N94-28900
Stable RNA sequences as a tool for DNA probes and phylogenetic studies [PB94-135423] p 3385 N94-29156
One carbon metabolism in anaerobic bacteria: Regulation of carbon and electron flow during organic acid production [DE94-004852] p 3386 N94-30180

BALANCE
Disturbance of equilibrium on JAL flight crew p 3390 N94-28856
Space and vertigo: In relation to space motion sickness p 3390 N94-28857
An actively cooled floating element skin friction balance for direct measurement in high enthalpy supersonic flows p 3289 N94-29824

BALL BEARINGS
Parachute Swivel Mechanism for planetary entry p 3162 N94-29643
Rotor instability induced by dead band clearance in bearing supports p 3312 N94-30809

BALLISTICS
Ballistic performance of polycarbonate/polyester and polycarbonate/styrene- acrylonitrile microlayer sheets [AD-A275462] p 3177 N94-28735
Dynamic response of ceramics [AD-A275396] p 3214 N94-29203

BALLOON SOUNDING
Observations of the geomagnetic field by Polar Patrol Balloon (PPB) experiment in Antarctica p 3359 N94-29235
Data transfer system using a multi-ID ARGOS transmitter for the Antarctic polar patrol balloon experiment p 3363 N94-29980

BALLOONING MODES
Higher order collisionless ballooning mode in tokamaks [PPL-143] p 3507 N94-30156
Eigenmode analysis of the destabilized ion acoustic mode in tokamaks [PPL-142] p 3507 N94-30158
Resistive ballooning mode in a gas-dynamic trap [DE94-608328] p 3508 N94-30171
Advanced steady-state operating scenarios [DE94-004810] p 3509 N94-30768

BANACH SPACE
Approximation methods for nonlinear operator equations of the m-accretive type [DE94-608099] p 3467 N94-30065
Comparative semantics for linear arrays of communicating processes [CWI-CS-R9336] p 3426 N94-30491

BAND STRUCTURE OF SOLIDS
Energy gap structure of layered superconductors [DE94-005132] p 3511 N94-28570
Nonadiabatic effects in the quantum Hall regime p 3513 N94-29530
Band structure of superlattice with (delta)-like potential [DE94-608108] p 3516 N94-30072

BANDWIDTH
The Rb 780-nanometer Faraday anomalous dispersion optical filter: Theory and experiment p 3250 N94-29659
Sampling behaviour in a four instrument monitoring task: Effects of signal bandwidth and number of events per signal [AD-B179613] p 3402 N94-30422

BARIUM COMPOUNDS
Normal state resistivity of MBa2Cu3O(7-x) ceramics [DE94-608456] p 3220 N94-30745

BARLEY
Barley cell culture as a producer of heterologous protein [PB94-132339] p 3379 N94-28408

BAROCLINIC INSTABILITY
Physical processes associated with variability in successive operational model forecasts of cyclogenesis [ISBN-0-315-74753-6] p 3371 N94-29751
Multiple weather regimes and baroclinically forced spherical resonance [DM-65] p 3376 N94-30966

BAROCLINIC WAVES
Physical processes associated with variability in successive operational model forecasts of cyclogenesis [ISBN-0-315-74753-6] p 3371 N94-29751
Downstream development of baroclinic waves p 3372 N94-29796

BAROCLINITY
Multiple weather regimes and baroclinically forced spherical resonance [DM-65] p 3376 N94-30966

BAROTROPIC FLOW
Papers in meteorology and geophysics, vol. 44, no.1 [JTN-94-80585] p 3324 N94-28693
On the linear stability of Verkley's modons p 3324 N94-28695

BARRED GALAXIES
Multicolor photometry of barred spiral galaxies p 3541 N94-30270

BARRIER LAYERS
Epitaxial heterojunctions of oxide semiconductors and metals on high temperature superconductors [NASA-CASE-NPO-18483-1-CU] p 3513 N94-29501
Strong overlap and transmission in triple barrier resonant structures [DE94-608103] p 3516 N94-30067

BARYONS
Semileptonic heavy-to-light decays of baryons [DE94-606481] p 3487 N94-29502

BASALT
Motion and development of the Pacific Plate from the Middle Jurassic to the Late Cretaceous p 3362 N94-29939
Geochemical and fluid dynamic investigations into the nature of chemical variability in the Earth's mantle p 3367 N94-30917

BASE FLOW
Development and application of particle image velocimetry in high-speed separated flow: Two-dimensional base cavities p 3282 N94-30791

BATCH PROCESSING
Batch updates and concurrency in B-trees [PB94-136835] p 3530 N94-29167

BATHYMETERS
Considerations in the modelling of seafloor acoustic backscatter [AD-A275404] p 3478 N94-29206

BAYES THEOREM
Bayesian belief networks and conditional independencies [RUU-CS-92-36] p 3465 N94-30376

BEAM CURRENTS
A transmission-loss monitor using current transformers [DE94-003974] p 3267 N94-30716

BEAM INJECTION
Active electron and ion beam experiments in space [AD-A275570] p 3504 N94-28828
A 6MeV heavy ion beam probe for the Large Helical Device [NIFS-272] p 3505 N94-29397
Tuning of AmPS [NIKHEF-K-AMPS-93-01] p 3494 N94-29422
Peculiarities of heat transfer in the experiments of beam injection heating of a plasma at the GOL-3 device [DE94-608357] p 3508 N94-30194
A future, intense source of negative hydrogen ions p 3494 N94-30485

BEAM WAVEGUIDES
Laser beam steering with semiconductor waveguide [AD-A275775] p 3292 N94-28765
X-/Ka-band dichroic plate design and grating lobe study p 3247 N94-29616
A portable X-band front-end test package for beam-waveguide antenna performance evaluation. Part 2: Tests on the antenna p 3247 N94-29620
Gaussian beam and physical optics iteration technique for wideband beam waveguide feed design p 3248 N94-29624
Determining noise temperatures in beam waveguide systems p 3249 N94-29657

BEAMS (RADIATION)
Gaussian beam and physical optics iteration technique for wideband beam waveguide feed design p 3248 N94-29624

BEAMS (SUPPORTS)
Position control of a flexible beam with active damping of vibrations [ISBN-0-315-85841-9] p 3321 N94-30033
Damage identification in composites using built-in piezoelectrics p 3184 N94-30355

Thin-walled orthotropic laminated beam theory
p 3324 N94-30920

BED REST
Leg muscle volume during 30-day 6-degree head-down bed rest with isotonic and isokinetic exercise training
[NASA-TM-4580] p 3385 N94-29401

BEDS (PROCESS ENGINEERING)
Electrochemical incineration of wastes
[NASA-CR-195262] p 3198 N94-29938

BEHAVIOR
Behavior and visual control of cyprinodonts under microgravity p 3387 N94-29713

BELTS
A newly developed snow vehicle (SM100S) for Antarctica. Part 4: Low temperature properties of crawler belt p 3314 N94-29984

BENDING
Numerical and experimental investigation of the bending response of thin-walled composite cylinders
[NASA-CR-195730] p 3317 N94-28801
Interlaminar fracture analysis for laminated composites under combined loading p 3182 N94-29964
Analysis and design of inflatable aerospace structures
p 3403 N94-30799

BENDING MOMENTS
Analysis and design of inflatable aerospace structures
p 3403 N94-30799

BENDING VIBRATION
Position control of a flexible beam with active damping of vibrations
[ISBN-0-315-85841-9] p 3321 N94-30033
Analysis and design of inflatable aerospace structures
p 3403 N94-30799

BENZENE
Polyimides containing the penta fluoro sulfanyl benzene moiety
[NASA-CASE-LAR-15082-1] p 3175 N94-29554

BERYLLIUM
Radiation effects in beryllium used for plasma protection
[DE94-004599] p 3201 N94-28460

BETA FACTOR
Beta enhancement of thermal diffusivity in tokamaks
[PPL-141] p 3508 N94-30159

BEVERAGES
Effects of three hydration beverages on exercise performance during 60 hours of simulated desert exposure p 3383 N94-28448

BIAS
Longitudinal effects and intensity-phase coupling in distributed feedback semiconductor lasers
p 3294 N94-29590

BIBLIOGRAPHIES
Microgravity science and applications. Program tasks and bibliography for FY 1993
[NASA-TM-4569] p 3227 N94-28415
Aeronautical engineering: A cumulative index to a continuing bibliography (supplement 300)
[NASA-SP-7037(300)] p 3121 N94-28537
ARTI Refrigerant Database
[DE94-004906] p 3230 N94-28563
Catalog of Air Force weather technical publications 1992-1993
[AD-A275635] p 3368 N94-28638
TRADOC library and information network (TRALINET). Union list of periodicals (TULIP)
[AD-A275263] p 3529 N94-28903
Defense Technical Information Center cataloging guidelines
[AD-A275100] p 3529 N94-28911
Learning about the Internet bibliography and beginners' guide
[AD-A275205] p 3430 N94-29051
Publications of the NASA Controlled Ecological Life Support System (CELSS) program 1989-1992
[NASA-CR-4603] p 3401 N94-30122
NREL Photovoltaic Program FY 1993 bibliography
[DE94-000272] p 3340 N94-30820

BIG BANG COSMOLOGY
A theory approach for creation of the matter of universe
[DE94-608109] p 3548 N94-30163

BIMETALS
Fundamental studies of hydrogen interaction with supported meta and bimetallic catalysts
[DE94-004887] p 3202 N94-28562

BINARY ALLOYS
Intermetallic growth at the interface between copper and bismuth-tin solder
[AD-A275716] p 3202 N94-28643
Localization in presence of magnetic field in 2-D disordered binary alloys
[DE94-608093] p 3208 N94-30108
Volume averaged model for the mechanics of alloys solidification
[PB94-138617] p 3208 N94-30113
Nature of dissolution of binary tantalum-titanium alloys by molten plutonium
[DE94-005090] p 3210 N94-30776

BINARY CODES
Modifications of the Griesmer bound
p 3247 N94-29618

BINARY DATA
Modifications of the Griesmer bound
p 3247 N94-29618

BINARY MIXTURES
Ionic conduction mechanisms in CaF2 and CaF2-Al2O3 nanocomposite films on Al2O3 substrates
[DE94-004792] p 3520 N94-30773

BINARY PHASE SHIFT KEYING
Communications subsystem for the Petite Amateur Navy Satellite (PANSAT)
[AD-A275532] p 3242 N94-28812

BINARY STARS
Binary-single star scattering: An investigation of a realistic chaotic scattering system p 3543 N94-29719
A study of recycled pulsars in globular clusters
p 3539 N94-29825
Coronal temperatures of unusually active K-dwarf binary systems
[NASA-CR-189335] p 3545 N94-29861

BINARY SYSTEMS (MATERIALS)
Effect of microstructure on the strength and fracture energy of bimaterial interfaces
[AD-A274987] p 3178 N94-29126
Mechanical alloying processing with application to structural materials: ASSERT supplement
[AD-A275400] p 3204 N94-29205

BINOCULAR VISION
Design and control of active vision based mechanisms for intelligent robots
[AIAA PAPER 94-1196-CP] p 3442 N94-30547

BIOASSAY
Microfabricated silicon biosensors for microphysiometry p 3238 N94-29783
Computerized in vitro test for chemical toxicity based on tetrahymena swimming patterns
p 3354 N94-30463

BIOASTRONAUTICS
Hemodynamic measurement during parabolic flight
p 3393 N94-29717
Motion sickness in parabolic flight: Possibility of electrogastrography as an objective index
p 3393 N94-29718

BIOCHEMISTRY
Cellular and molecular approaches to polymer synthesis by bacteria
[AD-A275501] p 3212 N94-28661
Development of novel switchable protein surfaces
[AD-A275510] p 3384 N94-28667
Biodiesel from aquatic species
[DE94-000275] p 3225 N94-30038
One carbon metabolism in anaerobic bacteria: Regulation of carbon and electron flow during organic acid production
[DE94-004852] p 3386 N94-30180
Lattice gas simulations of replicating domains
[DE94-005008] p 3200 N94-30748

BIOCONVERSION
Journal of NIRE, Vol. 2, No. 2
[JTN-94-80552] p 3187 N94-28675
Researches on bioconversion of coal into liquid product p 3187 N94-28677
Fossil energy biotechnology: A research needs assessment
[DE94-004239] p 3338 N94-29953
Fuel cycle evaluations of biomass-ethanol and reformulated gasoline
[DE94-000227] p 3226 N94-30818
Biological conversion of synthesis gas
[DE94-005815] p 3340 N94-30879

BIODEGRADATION
Fossil energy biotechnology: A research needs assessment
[DE94-004239] p 3338 N94-29953

BIOGEOCHEMISTRY
Atmosphere, ocean, and land: Critical gaps in Earth system models p 3350 N94-30617
Towards coupled physical-biogeochemical models of the ocean carbon cycle p 3350 N94-30618
Linkages between terrestrial ecosystems and the atmosphere p 3351 N94-30624
Development of simplified ecosystem models for applications in Earth system studies: The Century experience p 3352 N94-30629
A toy terrestrial carbon flow model
p 3352 N94-30630

BIOINSTRUMENTATION
Microfabricated silicon biosensors for microphysiometry p 3238 N94-29783

BIOLOGICAL EFFECTS
Computerized in vitro test for chemical toxicity based on tetrahymena swimming patterns
p 3354 N94-30463
Electric power lines: Questions and answers on research into health effects
[DE94-005637] p 3353 N94-30757
Role of x ray-induced transcripts in adaptive responses following x rays
[DE94-005412] p 3386 N94-30895

BIOMASS
Impact study on the use of biomass-derived fuels in gas turbines for power generation
[DE94-000261] p 3224 N94-28502
Copepods collected along 33.5 deg E longitude of the Antarctic Ocean in the 1976 summer
p 3358 N94-29082
Caesium-137 in a boreal forest ecosystem: Aspects on the long-term behavior
[PB94-137809] p 3347 N94-29158
Impact of biomass burning on the atmosphere
[DE94-004333] p 3349 N94-29954
The direct observation of alkali vapor species in biomass combustion and gasification
[DE94-000262] p 3339 N94-30606
Annual report and summaries of FY 1993 activities: Division of Energy Biosciences
[DE94-001723] p 3386 N94-30607
Proceedings of the low cost materials of construction for biological processes workshop
[DE94-000218] p 3226 N94-30761

BIOMASS ENERGY PRODUCTION
Annual report and summaries of FY 1993 activities: Division of Energy Biosciences
[DE94-001723] p 3386 N94-30607
Fuel cycle evaluations of biomass-ethanol and reformulated gasoline
[DE94-000227] p 3226 N94-30818

BIOMETRICS
Motion sickness in parabolic flight: Possibility of electrogastrography as an objective index
p 3393 N94-29718
Non-invasive temperature measurements using electron paramagnetic resonance spectroscopy
p 3198 N94-29881

BIOPROCESSING
Researches on bioconversion of coal into liquid product p 3187 N94-28677

BIOREACTORS
Biological conversion of synthesis gas
[DE94-005815] p 3340 N94-30879

BIOSPHERE
Linkages between terrestrial ecosystems and the atmosphere p 3351 N94-30624
Evaluating models of climate and forest vegetation
p 3353 N94-30637
Comprehensive system models: Strategies for evaluation p 3353 N94-30638

BIOSYNTHESIS
Cellular and molecular approaches to polymer synthesis by bacteria
[AD-A275501] p 3212 N94-28661
Biodiesel from aquatic species
[DE94-000275] p 3225 N94-30038
One carbon metabolism in anaerobic bacteria: Regulation of carbon and electron flow during organic acid production
[DE94-004852] p 3386 N94-30180

BIOTECHNOLOGY
Fossil energy biotechnology: A research needs assessment
[DE94-004239] p 3338 N94-29953
Technology 2003: The Fourth National Technology Transfer Conference and Exposition, volume 1
[NASA-CP-3249] p 3555 N94-30440
Composite redesign of obstetrical forceps
p 3397 N94-30457
Dexterity enhancement in microsurgery using telemicro-robotics
[AIAA PAPER 94-1230-CP] p 3447 N94-30579
Annual report and summaries of FY 1993 activities: Division of Energy Biosciences
[DE94-001723] p 3386 N94-30607
Proceedings of the low cost materials of construction for biological processes workshop
[DE94-000218] p 3226 N94-30761

BIOTITE
Studies in Jurassic and Cretaceous North American apparent polar wander p 3362 N94-29940

BIPOLAR TRANSISTORS
Solid-state, active-phased arrays: Some aspects of receiver design
[AD-A275893] p 3527 N94-28779
Effects of oxide charge and surface recombination velocity on the excess base current of BJT's
[DE94-003711] p 3263 N94-29025

A bipolar analog front-end integrated circuit for the SDC silicon tracker
[DE94-005203] p 3267 N94-30711

BIRDS
Development and implementation of a scrub habitat compensation plan for Kennedy Space Center
[NASA-TM-109202] p 3347 N94-29099

BIREFRINGENCE
Experimental and theoretical studies of molecular solids
[AD-A275511] p 3485 N94-28668
Electrooptical and optical evaluation of Pb(Zr,Ti)O3 thin films using waveguide refractometry
[DE94-006374] p 3518 N94-30247

BIRTH
Composite redesign of obstetrical forceps
p 3397 N94-30457

BISMALEIMIDE
Irradiation polymerization of bismaleimide resins
[REPT-932-430-105] p 3215 N94-29441
Correlation between wet ageing, humidity absorption and properties on composite materials based on different resins family
[REPT-932-600-107] p 3179 N94-29462

BISMUTH ALLOYS
Electrodeposition of bismuth alloys by the controlled potential method
[DE94-605318] p 3212 N94-28550
Intermetallic growth at the interface between copper and bismuth-tin solder
[AD-A275716] p 3202 N94-28643
Microstructural development and mechanical behavior of eutectic bismuth-tin and eutectic indium-tin in response to high temperature deformation
[DE94-005202] p 3210 N94-30710

BISMUTH OXIDES
Investigation of the phase equilibria and phase transformations associated with the Bi2Sr2CaCu2O(y) superconductor
[DE94-004889] p 3519 N94-30691

BISPHENOLS
Poly(arylene ether-co-imidazole)s as toughness modifiers for epoxy resins
[NASA-CASE-LAR-15229-1-CU] p 3215 N94-29451

BIT ERROR RATE
Partially coherent detection of PSK signals in Rician channels
[ISBN-0-315-85799-4] p 3254 N94-30031

BIT SYNCHRONIZATION
Decoder synchronization for deep space missions
p 3250 N94-29664

BITS
Influence of clearance and rake angles on the cutting force of rock p 3368 N94-29520

BIVARIATE ANALYSIS
A family of joint probability models for cost and schedule uncertainties
[AD-A275513] p 3463 N94-28670

BLACK BODY RADIATION
Procedures for basic inverse problems: Black body radiation problem and phonon density of states problem
[ISBN-0-315-85757-9] p 3525 N94-30244

BLACK HOLES (ASTRONOMY)
On dyonic black holes and cosmic censorship
p 3546 N94-29912
Physics, astronomy, and astrophysics: A numerical study of the black hole plus Brill wave spacetime
p 3540 N94-29990
A numerical study of gravitational collapse
p 3548 N94-30271

BLACKOUT
Remote control of transcranial Doppler (TCD) probe during centrifuge exposures up to 9 +Gz
[AD-A275253] p 3400 N94-29029

BLANKETS (FUSION REACTORS)
Liquid metal MHD and heat transfer in a tokamak blanket slotted coolant channel
[DE94-004622] p 3506 N94-29510

BLOCH BAND
Nonadiabatic effects in the quantum Hall regime
p 3513 N94-29530

BLOCKS
Information system for flow simulation based on the Navier-Stokes equations vectorization
[AD-B179293] p 3281 N94-30763

BLOOD
Japanese Journal of Aerospace and Environmental Medicine, volume 30, no. 1
[JTN-94-80598] p 3389 N94-28850
Arterial oxygen saturation during +Gz acceleration by short-radius centrifuge p 3389 N94-28852

BLOOD FLOW
A comparison of four methods of rewarming individuals cooled by immersion in cold water p 3382 N94-28442
Effect of food intake on skin vasomotor responses to head-up tilt in humans p 3390 N94-28854
Remote control of transcranial Doppler (TCD) probe during centrifuge exposures up to 9 +Gz
[AD-A275253] p 3400 N94-29029
Effects of make-up on the heat transfer from the head in hyperthermic conditions p 3394 N94-29864

BLOOD PRESSURE
Effect of food intake on skin vasomotor responses to head-up tilt in humans p 3390 N94-28854

BLOOD PUMPS
Rotary blood pump
[NASA-CASE-MSC-22424-1] p 3299 N94-29370
Development of the NASA/Baylor VAD
p 3397 N94-30458

BLOOD VESSELS
Effect of food intake on skin vasomotor responses to head-up tilt in humans p 3390 N94-28854

BLOWING
Numerical study of the trailing vortex of a wing with wing-tip blowing
[NASA-CR-195803] p 3130 N94-29760

BLOWOUTS
Studies of lean blowout in a research combustor
p 3193 N94-29266

BLUE STARS
Globular cluster photometry near the turnoff: Blue stragglers, relative ages, and the horizontal branch
p 3538 N94-29732
Spatially resolved spectroscopy of AG Carinae, and direct evidence for stellar evolution: The central star of NGC 2392
[NASA-CR-189291] p 3545 N94-29871

BODIES OF REVOLUTION
Integral equation analysis of composite bodies of revolution and arbitrary surfaces with application to cavity-backed antennas p 3253 N94-29883

BODY CENTERED CUBIC LATTICES
Failure strength and mechanism of composite laminates under multiaxial loading conditions p 3182 N94-29875
Influence of tungsten alloying additions on the mechanical properties and texture of tantalum
[DE94-004994] p 3210 N94-30774

BODY FLUIDS
Studies on water electrolyte metabolism and endocrine responses at rest and during submaximal exercise at 6,000 m simulated altitude p 3388 N94-28496
Effects of training at simulated altitude of 6,000 m on endocrine responses at rest and during exercise at the same altitude p 3388 N94-28497

BODY KINEMATICS
Determination of acceleration field parameters with linear accelerometers
[PB94-125606] p 3290 N94-30742

BODY TEMPERATURE
Fuelling shivering in humans during cold water immersion p 3379 N94-28426
Biochemical enhancement of cold tolerance
p 3380 N94-28427
Treatment of mild immersion hypothermia by body-to-body and forced-air warming
p 3380 N94-28428
The potential of new textiles in improving survival prospects p 3380 N94-28430
Thermoregulation in the extreme cold environment
p 3381 N94-28438
Physiological investigations of the isolated rat's liver in hypothermia and hypoxia and their relevance in aircraft incidents above the sea p 3382 N94-28439
Rewarming methodologies in the field
p 3382 N94-28441
A comparison of four methods of rewarming individuals cooled by immersion in cold water p 3382 N94-28442
Thermal strain generated by an enhanced anti-G protection system in a hot climate p 3383 N94-28445
Implications of climatic extremes in aircrew NBC operations p 3383 N94-28446
Alleviation of thermal strain in the CF: Keeping our cool during the Gulf conflict p 3383 N94-28449
Test of a new protection suit in a climatic chamber
p 3384 N94-28452
Physiological responses during shipboard firefighting
[AD-A275104] p 3391 N94-28912

BODY WEIGHT
Nutrition and hydration status of aircrew members consuming an improved survival ration during a simulated survival scenario p 3380 N94-28429

BODY-WING CONFIGURATIONS
Numerical analysis of sonic boom in the near field
p 3125 N94-28962
Three-dimensional external flow computations using prismatic grid p 3127 N94-28979
Aircraft aerodynamics with deflected jets in ground effect p 3132 N94-29973

BOEING 737 AIRCRAFT
Dual-Band Infrared (DBIR) imaging inspections of Boeing 737 and KC-135 aircraft panels
[DE94-005700] p 3122 N94-29642

BOLTED JOINTS
Measurement and modelling of bolted joint stress relaxation in plastics
[PB94-124849] p 3318 N94-28841

BOLTS
Test and analysis of a stitched RFI graphite-epoxy panel with a fuel access door
[NASA-TM-108992] p 3178 N94-29100
Bolt and nut evaluator
[NASA-CASE-GSC-13468-1] p 3288 N94-29538

BOMBS (ORDNANCE)
Cockpit video: A low cost BDA source
[AD-A275228] p 3150 N94-29389

BONDED JOINTS
Casting of weldable graphite/magnesium metal matrix composites with built-in metallic inserts
p 3186 N94-30482

BONDING
Crystal structure of La(2-x)Ba(x)CuO4
[DE94-707688] p 3511 N94-28750
Method and apparatus for indicating disbonds in joint regions
[NASA-CASE-LAR-14626-1] p 3315 N94-29548

BORATES
Surface chemistry of boron-doped SiO2 CVD: Enhanced uptake of tetraethyl orthosilicate by hydroxyl groups bonded to boron
[DE94-005428] p 3221 N94-30896

BORIDES
Magnetotransport measurements in magnetic fields up to 50T in SmB6 and FeSi
[DE94-006227] p 3520 N94-30848

BORN-INFELD THEORY
The Klein-Fock equation, minimal surfaces and gravitational fields
[DE94-606340] p 3356 N94-28803

BORN-OPPENHEIMER APPROXIMATION
Low frequency dynamics of CO/Cu-breakdown of Born-Oppenheimer approximation
[DE94-005508] p 3510 N94-28512

BOSONS
Asymptotic coherence of gluons and of q-bosons
[DE94-005417] p 3481 N94-28492
Properties of W + jet events in proton-antiproton collisions at 1.8 TeV
[DE94-004002] p 3482 N94-28524
Path integral for coherent states of the dynamical U(sub 2) group and U(sub 2/1) supergroup
[DE94-606382] p 3466 N94-28785
Twistor-like type 2 superstring and bosonic string
[DE94-606339] p 3523 N94-28802
Measurement of the W mass in the D0 detector
[DE94-006002] p 3490 N94-30103
Space-time symmetries: P and CP violation
[DE94-005012] p 3526 N94-30750

BOUNDARY CONDITIONS
The static and nonstatic electrical solenoids
[DE94-606326] p 3261 N94-28585
Numerical solution of the multichannel scattering problem
[DE94-606297] p 3484 N94-28619
A method for the modelling of porous and solid wind tunnel walls in computational fluid dynamics codes
[NASA-CR-195699] p 3270 N94-28724
Modelling and analysis of creep deformation and fracture in a 1 Cr 1/2 Mo ferritic steel
[PB94-138328] p 3319 N94-29121
A non-local computational boundary condition for duct acoustics
[NASA-TM-109091] p 3478 N94-29382
Stress transfer mechanics for multiple perfectly bonded concentric cylinder models of unidirectional composites
[PB94-138633] p 3181 N94-29524
Boundary-induced phase transitions in equilibrium and non-equilibrium systems
[DE94-608137] p 3199 N94-30111
Three-dimensional free vibration analysis of thick arbitrarily laminated, rectangular, cylindrical and spherical composite panels p 3184 N94-30257

BOUNDARY ELEMENT METHOD
Analysis of 3-D acoustic problems using boundary element method p 3127 N94-28974
Experimental validation of finite element and boundary element methods for predicting structural vibration and radiated noise
[NASA-CR-4561] p 3301 N94-29552
Modal analysis of solar panels using boundary integral equations
[NLT-TP-92218-U] p 3338 N94-30328
Comparison of RCS prediction techniques, computations and measurements
[PB94-125515] p 3256 N94-30392

BOUNDARY INTEGRAL METHOD
A spectral boundary integral equation method for the 2-D Helmholtz equation
[NASA-CR-194890] p 3454 N94-30207

BOUNDARY LAYER CONTROL
Method of reducing hydraulic instability
[NASA-CASE-LEW-15463-1] p 3273 N94-29539
BOUNDARY LAYER FLOW
Boundary layers induced by three-dimensional vortex loops
[AD-A275678] p 3270 N94-28665
Papers in meteorology and geophysics, vol. 44, no.1
[JTN-94-80585] p 3324 N94-28693
Structure of neutrally stratified turbulent Ekman layer as predicted by closure models with prognostic equation for master length scale p 3325 N94-28696
Spin-up in a rectangular cylinder
[AD-A275465] p 3271 N94-28738
A flow visualization study of acoustically enhanced hairpin vortices
[AD-A275467] p 3271 N94-28809
Long-wavelength asymptotics of unstable crossflow modes, including the effect of surface curvature
[NASA-CR-4579] p 3273 N94-29460
The effect of a wavy boundary on turbulent flow p 3280 N94-30272
The effect of pressure gradient on the structure of an equilibrium turbulent boundary layer p 3282 N94-30807
BOUNDARY LAYER SEPARATION
Boundary layers induced by three-dimensional vortex loops
[AD-A275678] p 3270 N94-28665
Fluid dynamic noise in a centrifugal pump
[AD-A275264] p 3477 N94-28904
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion p 3130 N94-29674
The flow field near the body surface with thin filaments p 3234 N94-29706
BOUNDARY LAYER TRANSITION
An experimental study of the flowfield on a semispan rectangular wing with a simulated glaze ice accretion p 3130 N94-29674
Experiments and theoretical considerations regarding the allowable roughness height in laminar flow
[PB94-125556] p 3133 N94-30389
BOUNDARY LAYERS
Boundary layer coherent structures
[AD-A275007] p 3272 N94-29195
The flow field near the body surface with thin filaments p 3234 N94-29706
BOUNDARY VALUE PROBLEMS
A numerical solver for initial and boundary value problems in differential-algebraic systems
[AD-A275447] p 3452 N94-28883
Weighted and unweighted maximum clique algorithms with upper bounds from fractional coloring
[AD-A275328] p 3409 N94-28917
Compound matrix method for multi-point boundary-value problems
[PB94-137791] p 3453 N94-29476
A spectral boundary integral equation method for the 2-D Helmholtz equation
[NASA-CR-194890] p 3454 N94-30207
Accurate finite difference methods for time-harmonic wave propagation
[NASA-CR-194887] p 3454 N94-30209
Process modelling for materials preparation experiments
[NASA-CR-195782] p 3175 N94-30242
A numerical study of gravitational collapse p 3548 N94-30271
Parallel iteration across the steps of high order Runge-Kutta methods for nonstiff initial value problems
[CWI-NM-R9313] p 3433 N94-30730
Generalized Eulerian-Lagrangian formulations in free and moving boundary problems: Processing of viscoelastic polymers and fiber suspensions p 3283 N94-30955
BRAIDED COMPOSITES
Development of braided rope engine seals
[NASA-TM-105902] p 3298 N94-28838
On the dynamic mechanical behavior of 3-D integrated fabric reinforced composites
[AD-A275424] p 3177 N94-28865
3-D braided, continuous fiber ceramic composites produced by chemical vapor infiltration
[AD-A275192] p 3178 N94-29024
BRAIN
Synaptogenesis, selective stabilization, and free association
[AD-A275250] p 3392 N94-29431
Japanese Journal of Aerospace and Environmental Medicine, vol. 30, no. 2
[JTN-94-80599] p 3394 N94-29863
Effects of make-up on the heat transfer from the head in hyperthermic conditions p 3394 N94-29864
BRANCHING (MATHEMATICS)
Parallel quantification
[LP-93-01] p 3422 N94-30318
Three metric domains of processes for bisimulation
[CWI-CS-R9335] p 3459 N94-30427
Hopf bifurcation in viscous, low-speed flows about an airfoil with structural coupling p 3134 N94-30865
BRASSES
Studies of high temperature ternary phases in mixed-metal-rich early transition metal sulfide and phosphide systems
[DE94-006034] p 3209 N94-30336
BREADBOARD MODELS
Design and implementation of a hybrid digital phase-locked loop with a TMS320C25: An application to a transponder receiver breadboard p 3251 N94-29667
Electrochemical incineration of wastes
[NASA-CR-195262] p 3198 N94-29938
Analysis of EDP performance
[NASA-CR-195726] p 3420 N94-29945
BREAKWATERS
Bulletin of National Research Institute of Fisheries Engineering, No. 13
[JTN-94-80596] p 3233 N94-29701
Development of the breakwater with submerged mound for interchanging sea water p 3234 N94-29703
BREATHING APPARATUS
Emergency underwater breathing aids for helicopter passengers and crew p 3381 N94-28437
Decompression sickness risk versus time and altitude
[AD-A275261] p 3391 N94-29071
BREEDING (REPRODUCTION)
Reproduction in the Japanese anchovy (Engraulis japonica) as related to population fluctuation p 3235 N94-29708
BREMSSTRAHLUNG
A measurement of the LMP effect
[DE94-005225] p 3482 N94-28493
Plasma turbulent bremsstrahlung
[PPL-144] p 3507 N94-30157
Quantum-mechanical suppression of bremsstrahlung
[DE94-005223] p 3497 N94-30712
BRIDGES (STRUCTURES)
Study of bridge design and technology
[PB94-137916] p 3121 N94-29160
BRIGHTNESS
Multicolor photometry of barred spiral galaxies p 3541 N94-30270
Optical depth effects in cluster cooling flows p 3541 N94-30800
BRIGHTNESS TEMPERATURE
Inter-comparison of Wildfire and High-resolution Interferometer Sounder (HIS) data from STORM-FEST: An investigation of wildfire spectral channel discrepancies
[NASA-TM-108439] p 3333 N94-29553
Atmospheric moisture fields derived by satellite observations over the tropical Pacific Ocean p 3375 N94-30863
BRINES
Solubility of Nd in brine
[DE94-005099] p 3187 N94-28567
BRITTLE MATERIALS
Estimation of Weibull modulus from dynamic and static fatigue experiments
[PB94-138641] p 3322 N94-30114
BRITTLENESS
Fracture process zone of brittle composites p 3182 N94-29876
Brittle composites modeling: Comparisons with MoSi2/ZrO2
[DE94-004978] p 3182 N94-29933
The role of plastic deformation in brittle and near-brittle cracking behavior p 3322 N94-30226
A class of inclusion problems for the strengthening of brittle and ductile composites p 3186 N94-30959
BROADBAND
Broadband EUV survey spectrometer for short-timescale experiments
[DE94-005459] p 3498 N94-28534
Absolute calibration technique for broadband ultrasonic transducers
[NASA-CASE-LAR-14672-1] p 3287 N94-29199
Gaussian beam and physical optics iteration technique for wideband beam waveguide feed design p 3248 N94-29624
A digital combining-weight estimation algorithm for broadband sources with the array feed compensation system p 3250 N94-29660
Digital combining-weight estimation for broadband sources using maximum-likelihood estimates p 3250 N94-29661
A broad-band microseismometer for planetary operations p 3237 N94-29778
Communications technology for unattended sensors
[DE94-005685] p 3254 N94-30043
II-VI wide band gap semiconductors under hydrostatic pressure
[DE94-608106] p 3516 N94-30070
Microsecond fiber optic delay line
[DE94-607903] p 3500 N94-30075
Performance issues of signalling protocols for broadband ISDN
[MEMO-INF-93-30] p 3255 N94-30374
BROADCASTING
Design and analysis of dynamic leader election protocols in broadcast networks
[MEMO-INF-93-43] p 3260 N94-30520
BROKEN SYMMETRY
Discrete quark-lepton symmetry need not pose a cosmological domain wall problem
[DE94-601606] p 3481 N94-28471
Discrete symmetries, strong CP problem and gravity
[DE94-608091] p 3524 N94-30089
Space-time symmetries: P and CP violation
[DE94-005012] p 3526 N94-30750
BROMINE
Pitting corrosion of titanium
[AD-A274980] p 3203 N94-29089
BROWNIAN MOVEMENTS
Non-Markovian quantum Brownian motion of a harmonic oscillator
[DE94-005922] p 3477 N94-30873
BRYOPHYTES
Estimation of the net production of moss community at Langhovde, East Antarctica p 3358 N94-29081
Japan-China collaboration research program on terrestrial biology at Great Wall Station in King George Island, in the summer of 1990/1991 p 3358 N94-29085
Cellular polarity and interactions in plant graviperception
[NASA-CR-195261] p 3385 N94-29943
BSCCO SUPERCONDUCTORS
Exploratory research for a high temperature superconducting integrated circuit
[AD-A275798] p 3262 N94-28767
BUBBLE CHAMBERS
Weak decays of charged K-mesons and charm particles
[PB94-138062] p 3486 N94-29143
Adaption of the bubble detector for use as a LET spectrometer p 3291 N94-30216
BUBBLES
Analysis of spark-induced bubble experiments using CALE
[DE94-003667] p 3270 N94-28476
Numerical analysis of incompressible viscous flow around a bubble p 3126 N94-28968
BUCKLING
Numerical and experimental investigation of the bending response of thin-walled composite cylinders
[NASA-CR-195730] p 3317 N94-28801
General theory and algorithms for the non-casual inversion, slewing and control of space-based articulated structures
[AD-A275118] p 3167 N94-29002
Computational simulation of composite structures with and without damage
[NASA-CR-194433] p 3183 N94-30190
BUDGETING
Business planning model user's guide
[AD-A274978] p 3409 N94-28895
Financial resource review model user's guide
[AD-A274979] p 3410 N94-29088
BUFFER STORAGE
I/O on the Tera file system
[AD-A275278] p 3530 N94-29182
BUILDINGS
Object-oriented CAD tool implementations for the construction industry
[PB94-132370] p 3407 N94-28411
Exploitation of stereophotogrammetrically derived 3-D wireframe models to produce urban simulations
[AD-A275459] p 3325 N94-28808
Rooftop emergency heliports
[DOT/FAA/RD-93/2] p 3157 N94-29754
Improved ground-penetrating radar, bridge decks
[DE94-004863] p 3254 N94-29929
BULK MODULUS
Measurement of bulk longitudinal modulus and correction for edge effects
[DE94-005581] p 3222 N94-30900
BULKHEADS
Aircraft system aft telescope cavity configuration study for Stratospheric Observatory for Infrared Astronomy (SOFIA), phase 2
[NASA-CR-194266] p 3147 N94-29685
Photovoltaic power without batteries for continuous cathodic protection p 3341 N94-30465
BUOYANCY
Similarity solutions and numerical modeling in buoyancy controlled turbulent diffusion flames
[AD-A275820] p 3188 N94-28777

Development of buoyancy affected laminar flow in a heated pipe p 3128 N94-28988
BUOYS
The velocity field in the Northeast Atlantic from satellite-tracked drifting buoys
[AD-A275704] p 3376 N94-28690
BURNERS
Numerical simulation of radiative heat loss in an experimental burner
[DE94-002016] p 3277 N94-29923
BURNOUT
Experimental and analytical studies of high heat flux components for fusion experimental reactor
[DE94-707671] p 3504 N94-28556
BUTANES
Effects of hydrogen addition on pollutant emissions in a gas turbine combustor p 3195 N94-29275

C

C BAND
Evaluation of dual polarization attenuation of millimeter frequencies through a meteorological radar p 3256 N94-30496
C-135 AIRCRAFT
KC-135 cockpit modernization study and crew reduction feasibility demonstration
[AD-A275230] p 3146 N94-29391
Dual-Band Infrared (DBIR) imaging inspections of Boeing 737 and KC-135 aircraft panels
[DE94-005700] p 3122 N94-29842
CABLES
Unscreened low tension cables scrape abrasion testing. Part 1: An interlaboratory study on scrape abrasion testing according to ISO DP 6722-1
[PB94-135605] p 3264 N94-29191
CADMIUM SELENIDES
Electronic structure of Zn-based quantum wells
[DE94-608104] p 3516 N94-30068
CADMIUM SULFIDES
Optical properties of cadmium sulfide, zinc selenide, and zinc manganese selenide semiconductor films p 3500 N94-29759
CADMIUM TELLURIDES
Modeling the total dose radiation effects of Hg(1-x)Cd(x)Te photodiodes using numerical device simulators
[AD-A275235] p 3263 N94-29028
Vibrational properties of homopolar and heteropolar surfaces and interfaces of the CdTe/HgTe system
[DE94-608105] p 3516 N94-30069
CAFFEINE
Biochemical enhancement of cold tolerance p 3380 N94-28427
CALCIUM FLUORIDES
Ionic conduction mechanisms in CaF2 and CaF2-Al2O3 nanocomposite films on Al2O3 substrates
[DE94-004792] p 3520 N94-30773
CALCIUM OXIDES
Investigation of the phase equilibria and phase transformations associated with the Bi2Sr2CaCu2O(y) superconductor
[DE94-004889] p 3519 N94-30691
CALCULUS
A time reasoning system based on the event calculus for scheduling in aeronautic maintenance
[REPT-932-710-101] p 3122 N94-29463
Completeness of the Lambek calculus with respect to relativized relational semantics
[LP-93-03] p 3455 N94-30326
Models of the untyped lambda-calculus in semi Cartesian closed categories
[ML-93-05] p 3456 N94-30381
The conjoinability relation in Lambek calculus in linear logic
[ML-93-03] p 3457 N94-30397
The secrets of causality
[RUU-CS-93-29] p 3426 N94-30490
More problems on rewriting
[CWI-CS-R9332] p 3428 N94-30734
CALCULUS OF VARIATIONS
Four-dimensional data assimilation using the adjoint method p 3455 N94-30353
CALIBRATING
Testing laboratories as notified bodies
[PB94-132396] p 3160 N94-28413
Absolute calibration technique for broadband ultrasonic transducers
[NASA-CASE-LAR-14672-1] p 3287 N94-29199
Inter-comparison of Wildfire and High-resolution Interferometer Sounder (HIS) data from STORM-FEST: An investigation of wildfire spectral channel discrepancies
[NASA-TM-108439] p 3333 N94-29553
Line-of-sight tropospheric calibration from measurements in arbitrary directions p 3249 N94-29654
Summary report of mission acceleration measurements for Spacehab-01, STS-57 launched 21 June 1993
[NASA-TM-106514] p 3168 N94-29757
Calibration of charge coupled device digital cameras
[ISBN-0-315-85539-8] p 3290 N94-30232
Two-way satellite time transfer: Overview and recent developments p 3469 N94-30646
Remote clocks linked by a fully calibrated two-way timing link p 3471 N94-30659
LASSO experiment: Intercalibrations of the LASSO ranging stations p 3297 N94-30666
Ground control system for the midcourse space experiment UTC clock p 3474 N94-30674
Guidance notes for use with NPL low permeability reference materials
[NPL-DES-121] p 3476 N94-30780
The use of thermistors in the NPL electron-beam calorimeter
[PB94-139334] p 3290 N94-30782
Report on the development of low magnetic permeability reference materials
[NPL-DES-119] p 3476 N94-30783
Determination of photon fluence spectra from the NPL Mobaltron Co-60 unit
[NPL-RSA(EXT)-46] p 3492 N94-30795
Solar measurements from the Airglow-Solar Spectrometer Instrument (ASSI) on the San Marco 5 satellite
[NASA-CR-193815] p 3551 N94-30948
CALIFORNIA
The management issues of implementing telecommuting: A case study
[AD-A275267] p 3527 N94-28905
Site comparison for optical visibility statistics in southern California p 3247 N94-29617
Intermedia transfer factors for fifteen toxic pollutants released to air basins in California
[DE94-005699] p 3349 N94-30044
CALIFORNIUM ISOTOPES
Using Cf-252 for single event upset testing p 3496 N94-30219
CALORIC REQUIREMENTS
Nutrition and hydration status of aircrew members consuming an improved survival ration during a simulated survival scenario p 3380 N94-28429
CALORIMETERS
Elementary particle interactions
[DE94-004238] p 3482 N94-28504
The use of thermistors in the NPL electron-beam calorimeter
[PB94-139334] p 3290 N94-30782
CAMERA SHUTTERS
Three high duty cycle, space-qualified mechanisms p 3162 N94-29642
CAMERAS
Digital camera with apparatus for authentication of images produced from an image file
[NASA-CASE-NPO-19108-1-CU] p 3287 N94-29373
Three high duty cycle, space-qualified mechanisms p 3162 N94-29642
Camera artifacts in IUE spectra
[NASA-CR-189337] p 3198 N94-29857
Calibration of charge coupled device digital cameras
[ISBN-0-315-85539-8] p 3290 N94-30232
Sensing the gas metal arc welding process p 3314 N94-30444
CAMOUFLAGE
Spectral and polarimetric analysis of hyperspectral data collected by an acousto-optic tunable filter system
[AD-A275076] p 3329 N94-29095
Experimental evaluation of camouflage effectiveness in the thermal infrared p 3257 N94-30502
Global approach towards the evaluation of thermal infrared countermeasures p 3258 N94-30504
CANCELLATION
The bootstrapped algorithm: A fast algorithm for blind signal separation
[AD-A275759] p 3408 N94-28760
Method for cancelling expansion waves in a wave rotor
[NASA-CASE-LEW-15218-2] p 3274 N94-29740
CANCER
Conformal external radiotherapy of prostatic carcinoma: Requirements and preliminary results p 3395 N94-30029
CANONICAL FORMS
Canonical-variables multigrid method for steady-state Euler equations
[NASA-CR-194888] p 3454 N94-30208
Two algorithms for finding rectangular duals of planar graphs
[RUU-CS-92-41] p 3423 N94-30345
CANOPIES (VEGETATION)
Fractal approach to computer-analytical modelling of tree crown
[DE94-608089] p 3467 N94-30088
CANTILEVER BEAMS
An actively cooled floating element skin friction balance for direct measurement in high enthalpy supersonic flows p 3289 N94-29824
Fracture process zone of brittle composites p 3182 N94-29876
Delamination growth in composites under cyclic loads p 3183 N94-30256
Delamination of woven E-glass fabric composites
[DE94-003227] p 3185 N94-30827
CAPACITORS
Charge trapping and breakdown in N2O oxides
[DE94-003775] p 3266 N94-30040
Plasma treatment of polymer dielectric films to improve capacitive energy storage p 3223 N94-30479
CAPE KENNEDY LAUNCH COMPLEX
An observational and numerical study of sea/land-breeze circulations in an area of complex coastal heating p 3372 N94-29813
CARBOHYDRATES
Fuelling shivering in humans during cold water immersion p 3379 N94-28426
CARBON
Pull-test adhesion measurements of diamondlike carbon films on silicon carbide, silicon nitride, aluminum oxide, and zirconium oxide
[DE94-005469] p 3211 N94-28536
Silicon germanium carbon heteroepitaxial growth on silicon
[AD-A275197] p 3512 N94-28889
Preparation and structure of amorphous hydrogenated carbon film deposited with RF plasma CVD p 3223 N94-29518
One carbon metabolism in anaerobic bacteria: Regulation of carbon and electron flow during organic acid production
[DE94-004852] p 3386 N94-30180
CARBON CYCLE
Towards coupled physical-biogeochemical models of the ocean carbon cycle p 3350 N94-30618
The carbon cycle revisited p 3350 N94-30622
Ocean-atmospheric linkages p 3350 N94-30623
Linkages between terrestrial ecosystems and the atmosphere p 3351 N94-30624
Four simple ocean carbon models p 3351 N94-30625
A toy terrestrial carbon flow model p 3352 N94-30630
Carbon cycling in high-latitude ecosystems p 3352 N94-30631
Models of atmosphere-ecosystem-hydrology interactions: Approaches and testing p 3353 N94-30636
CARBON DIOXIDE
Peroxy radical measurements with NCAR's chemical amplifier p 3345 N94-28603
Survey on effects of petroleum substitution energy utilization on the global environment
[DE94-732339] p 3346 N94-28630
Computer simulation of molecular interactions in supercritical solvents
[AD-A274977] p 3486 N94-29087
The 1992-1993 advanced design program. Part 1: The Mars methane engine project. Part 2: The Mars oxygen processor new furnace
[NASA-CR-195513] p 3299 N94-29409
Second Japan-U.S. Workshop on Global Change: Environmental Response Technologies for Global Change (Mitigation and Adaptation) p 3354 N94-29522
Large heat pumps using CO2 refrigerant
[PB94-138773] p 3279 N94-29999
Dynamic constraints on CO2 uptake by an iron-fertilized Antarctic p 3350 N94-30619
Four simple ocean carbon models p 3351 N94-30625
CARBON DIOXIDE CONCENTRATION
The carbon cycle revisited p 3350 N94-30622
Ocean-atmospheric linkages p 3350 N94-30623
Linkages between terrestrial ecosystems and the atmosphere p 3351 N94-30624
Four simple ocean carbon models p 3351 N94-30625
The challenge of identifying greenhouse gas-induced climatic change p 3352 N94-30634
CARBON DIOXIDE REMOVAL
Second Japan-U.S. Workshop on Global Change: Environmental Response Technologies for Global Change (Mitigation and Adaptation) p 3354 N94-29522
CARBON FIBER REINFORCED PLASTICS
Assessment of the fibre volume distribution around optical fibres
[FFA-TN-1993-12] p 3179 N94-29425

Intelligent material systems and structures. Part 7: Debonding and pull-out of two optical fibers from two epoxies
[PB94-137767] p 3180 N94-29475

CARBON FIBERS
Formation and chemical reactivity of carbon fibers prepared by defluorination of graphite fluoride
[NASA-TM-106398] p 3174 N94-28747
Polymer infiltration studies
[NASA-CR-195729] p 3213 N94-28748
Graphite intercalation compounds prepared from graphite fluoride
[NASA-TM-106447] p 3174 N94-28924
Preparation of graphite fibers from polyimide
p 3223 N94-29517
Stress transfer mechanics for multiple perfectly bonded concentric cylinder models of unidirectional composites
[PB94-138633] p 3181 N94-29524

CARBON MONOXIDE
Low frequency dynamics of CO/Cu-breakdown of Born-Oppenheimer approximation
[DE94-005508] p 3510 N94-28512
The radiocarbon hydroxyl technique
p 3344 N94-28600
Simulation of pollutant formation in turbulent combustors using an extended coherent flame model
p 3190 N94-29251
Toxicity of carbon monoxide-hydrogen cyanide gas mixtures: Exposure concentration, time-to-incapacitation, carboxyhemoglobin, and blood cyanide parameters
[DOT/FAA/AM-94/7] p 3395 N94-29919

CARBON STEELS
Fatigue of carbon and low-alloy steels in LWR environments
[DE94-005116] p 3207 N94-30021

CARBON 13
Nuclear magnetic relaxation studies of semiconductor nanocrystals and solids
[DE94-006301] p 3520 N94-30842

CARBON 14
Cosmogenic C-14 in Antarctic and non-Antarctic meteorites and lunar samples
[NASA-CR-195795] p 3546 N94-29905
Dynamic constraints on CO2 uptake by an iron-fertilized Antarctic p 3350 N94-30619

CARBON-CARBON COMPOSITES
Damage meso-modeling of 3D evolutive composites
[REPT-932-430-106] p 3179 N94-29442
Performance of CVD and CVR coated carbon-carbon in high temperature hydrogen
[DE94-005451] p 3487 N94-29841
Dynamic fracture mechanics analysis for an edge delamination crack
[NASA-TM-109106] p 3479 N94-29856
Irradiation-induced structure and property changes in tokamak plasma-facing, carbon-carbon composites
[DE94-006046] p 3508 N94-30365
Four advances in carbon-carbon materials technology
p 3186 N94-30481

CARBONATES
Enhanced ion dissociation of LiCF3SO3 by new carbonate plasticizers: Raman and IR studies
[DE94-005448] p 3485 N94-28741
Fundamental stack and system issues in molten carbonate fuel cell development
[DE94-005960] p 3338 N94-30048
Configuration and performance of the indirect-fired fuel cell bottomed turbine cycle
[DE94-005961] p 3338 N94-30313

CARBONIZATION
Structural changes during carbonization and oxidation of coal p 3187 N94-28678

CARBOXYHEMOGLOBIN
Toxicity of carbon monoxide-hydrogen cyanide gas mixtures: Exposure concentration, time-to-incapacitation, carboxyhemoglobin, and blood cyanide parameters
[DOT/FAA/AM-94/7] p 3395 N94-29919

CARBOXYLIC ACIDS
Chemically modified polymeric resins for separation of cations, organic acids, and small polar molecules by high performance liquid chromatography
[DE94-005548] p 3211 N94-28516

CARDIAC OUTPUT
Development of the NASA/Baylor VAD
p 3397 N94-30458

CARDIAC VENTRICLES
Use of snakes to link edge points to create left ventricular boundaries in echocardiographic images
[TELECOM-93-D-016] p 3395 N94-30970

CARDIOVASCULAR SYSTEM
Effects of three hydration beverages on exercise performance during 60 hours of simulated desert exposure p 3383 N94-28448
Japanese Journal of Aerospace and Environmental Medicine, volume 30, no. 1
[JTN-94-80598] p 3389 N94-28850
Effect of food intake on skin vasomotor responses to head-up tilt in humans p 3390 N94-28854
Relaxed tolerance following HSG, high sustained +Gz
[AD-A275204] p 3391 N94-28892
Remote control of transcranial Doppler (TCD) probe during centrifuge exposures up to 9 +Gz
[AD-A275253] p 3400 N94-29029
The MERSS 5th Symposium on Space Medicine: Medical and Physiological Experiment Utilizing Parabolic Flight
[JTN-94-80588] p 3392 N94-29709
Hemodynamic measurement during parabolic flight
p 3393 N94-29717

CARRIER DENSITY (SOLID STATE)
Aggregation equilibria in arsenic doped silicon
[DE94-607269] p 3515 N94-30005

CARRIER MOBILITY
Transport properties of epitaxial lift off films
[NASA-TM-106156] p 3264 N94-29209

CARRIER TRANSPORT (SOLID STATE)
Photoelectronic study of GaAs epilayers and In(x)Ga(1-x)As/GaAs quantum wells
[ISBN-0-315-85756-0] p 3518 N94-30239

CARRIER WAVES
A digital combining-weight estimation algorithm for broadband sources with the array feed compensation system p 3250 N94-29660

CARTESIAN COORDINATES
Large-scale 3-D solutions of the time-dependent Dirac equation
[DE94-005591] p 3454 N94-30317

CARTRIDGES
Ampoule failure sensor time response testing: Experiment 1
[NASA-TM-108449] p 3290 N94-30199

CASCADE FLOW
Application of flow field simulation to turbine vane design p 3127 N94-28978
An elliptic-hyperbolic grid generation method and application to compressor flows p 3128 N94-28981
Mixed Eulerian-Lagrangian finite element solutions of unsteady flow and flutter in transonic cascade
p 3282 N94-30816

CASCADE RANGE (CA-OR-WA)
Analysis of deep seismic reflection and other data from the southern Washington Cascades
[DE94-005915] p 3367 N94-30883

CASE HISTORIES
Advanced development of PV encapsulents
[DE94-000219] p 3336 N94-28500
Development centres: Assessing or developing people
[PB94-138070] p 3536 N94-29144

CASSEGRAIN ANTENNAS
Beam scanning offset Cassegrain reflector antennas by subreflector movement
[NASA-CR-191604] p 3160 N94-28836
A portable X-band front-end test package for beam-waveguide antenna performance evaluation. Part 2: Tests on the antenna p 3247 N94-29620

CASSEGRAIN OPTICS
Determining noise temperatures in beam waveguide systems p 3249 N94-29657

CAST ALLOYS
New inoculants for ductile cast iron
[PB94-138476] p 3206 N94-29947

CASTING
Melt flow during alloy solidification: Dimensional analysis and model problems
[PB94-138625] p 3206 N94-29997
Casting of weldable graphite/magnesium metal matrix composites with built-in metallic inserts
p 3186 N94-30482

CASUALTIES
Aeromedical support for casualties in extremely hot climates p 3382 N94-28443

CATACLYSMIC VARIABLES
The cataclysmic variables from the Palomar-Green survey p 3539 N94-29819

CATALOGS (PUBLICATIONS)
Catalog of Air Force weather technical publications 1992-1993
[AD-A275635] p 3368 N94-28638
TRADOC library and information network (TRALINET). Union list of periodicals (TULIP)
[AD-A275263] p 3529 N94-28903
Defense Technical Information Center cataloging guidelines
[AD-A275100] p 3529 N94-28911

CATALYSIS
Fundamental studies of hydrogen interaction with supported meta and bimetallic catalysts
[DE94-004887] p 3202 N94-28562
Project of the experiment to test the hypothesis on existence of white and black p(mu)-atoms
[DE94-606751] p 3485 N94-28625
Polymer technology publication series no. 16
[PB94-135522] p 3214 N94-29157
Fuel-rich catalytic combustion of a high density fuel
[NASA-TP-3281] p 3197 N94-29356
Theoretical investigation of gas-surface interactions
[NASA-CR-195755] p 3272 N94-29378

CATALYSTS
Catalytic fabric filtration for simultaneous NO(x) and particulate control
[DE94-001660] p 3341 N94-28463
Fundamental studies of hydrogen interaction with supported meta and bimetallic catalysts
[DE94-004887] p 3202 N94-28562
Polymer technology publication series no. 16
[PB94-135522] p 3214 N94-29157
Theoretical investigation of gas-surface interactions
[NASA-CR-195755] p 3272 N94-29378
Catalytic ignitor for regenerative propellant gun
[NASA-CASE-NPO-18987-1-CU] p 3225 N94-29490
The polymerization of epsilon-caprolactone with stannous catalyst and lactide/epsilon-caprolactone (LA/epsilon-CL) and lactide/glycolide (LA/GA) copolymers. Polymer technology publication series no. 15
[PB94-137551] p 3220 N94-30713
Dual cure low-VOC coating process, phase 3
[DE94-003202] p 3221 N94-30826
Studies of supported molybdenum and tungsten
[DE94-006207] p 3210 N94-30839
Transient studies of low temperature catalysts for methane conversion
[DE94-005767] p 3200 N94-30877

CATALYTIC ACTIVITY
Catalytic fabric filtration for simultaneous NO(x) and particulate control
[DE94-001660] p 3341 N94-28463

CATEGORIES
Remarks on the theory of semi-functors
[ML-93-08] p 3457 N94-30384
Commutative Lambek categorial grammars
[ML-93-01] p 3457 N94-30395

CATHODES
Low voltage electron beam lithography
[AD-A275648] p 3262 N94-28650
RF vacuum microelectronics
[AD-A275221] p 3263 N94-28915
Dendrite preventing separator for secondary lithium batteries
[NASA-CASE-NPO-18585-1-CU] p 3265 N94-29411

CATHODIC COATINGS
Photovoltaic power without batteries for continuous cathodic protection p 3341 N94-30465

CATIONS
Chemically modified polymeric resins for separation of cations, organic acids, and small polar molecules by high performance liquid chromatography
[DE94-005548] p 3211 N94-28516

CAUCHY PROBLEM
Approximation of solutions of the cubic NLSE by finite dimensional equations and non-squeezing properties
[PB94-138294] p 3452 N94-29148

CAUCHY-RIEMANN EQUATIONS
Numerical solution of 3-D Navier-Stokes equations in vorticity-velocity form for incompressible flows
p 3276 N94-29843

CAVITIES
Neural network application to Particle Impact Noise Detection p 3437 N94-29840

CAVITY RESONATORS
Hydrogen maser clocks in space for solid-Earth research and time-transfer applications: Experiment overview and evaluation of Russian miniature sapphire loaded cavity
p 3474 N94-30676

CD-ROM
NASA space and Earth science data on CD-ROM
[NASA-TM-109709] p 3528 N94-28414

CELLS (BIOLOGY)
Barley cell culture as a producer of heterologous protein
[PB94-132339] p 3379 N94-28408
Cell culture in space p 3228 N94-28944
Stable RNA sequences as a tool for DNA probes and phylogenetic studies
[PB94-135423] p 3385 N94-29156
Computerized in vitro test for chemical toxicity based on tetrahymena swimming patterns
p 3354 N94-30463

CENTRIFUGAL COMPRESSORS
Numerical study on internal flows of centrifugal compressors p 3127 N94-28977
Method of reducing hydraulic instability
[NASA-CASE-LEW-15463-1] p 3273 N94-29539

CENTRIFUGAL FORCE
Use of magnetic compression to support turbine engine rotors p 3314 N94-30484

CENTRIFUGAL PUMPS
Fluid dynamic noise in a centrifugal pump
[AD-A275264] p 3477 N94-28904
Method of reducing hydraulic instability
[NASA-CASE-LEW-15463-1] p 3273 N94-29539
Experiments on the aerodynamic generation of noise in centrifugal turbomachinery p 3480 N94-30804

CENTRIFUGES
Relaxed tolerance following HSG, high sustained +Gz
[AD-A275204] p 3391 N94-28892
Comparative centrifuge evaluation of the Air Force Advanced Technology Anti-G Suit (ATAGS) and the Navy Enhanced Anti-G Lower Ensemble (EAGLE)
[AD-A275348] p 3400 N94-28996
Remote control of transcranial Doppler (TCD) probe during centrifuge exposures up to 9 +Gz
[AD-A275253] p 3400 N94-29029

CENTRIFUGING
Effect of chronic centrifugation on in vitro fertilization and early development in mice ova
p 3386 N94-28853
Centrifugal atomization of lanthanide materials for cryogenic coolers
[DE94-006035] p 3219 N94-30337

CEPHEID VARIABLES
Pushing the limit: Precision radial velocities, techniques, and applications p 3542 N94-30861

CERAMIC COATINGS
A novel approach to the fabrication of SiC structures of arbitrary shape
[AD-A275475] p 3214 N94-29073
Evaluation of oxide-coated iridium-rhenium chambers
[NASA-TM-106442] p 3172 N94-29097
Plasma sprayed ceramic thermal barrier coating for NiAl-based intermetallic alloys
[NASA-CASE-LEW-15535-1] p 3205 N94-29507
Synthesis and characterization of advanced materials for Navy applications p 3223 N94-30474
Deposition of tantalum carbide coatings on graphite by laser interactions p 3223 N94-30475

CERAMIC FIBERS
3-D braided, continuous fiber ceramic composites produced by chemical vapor infiltration
[AD-A275192] p 3178 N94-29024
Multiple Concentric Cylinder Model (MCCM) user's guide
[NASA-CR-195299] p 3183 N94-30125

CERAMIC MATRIX COMPOSITES
Fatigue behavior of a cross-ply ceramic matrix composite at elevated temperatures under tension-tension loading
[AD-A275466] p 3176 N94-28673
Innovative processing of composites for ultra-high temperature applications, book 1
[AD-A275597] p 3176 N94-28729
Innovative processing of composites for ultra-high temperature applications, book 3
[AD-A275599] p 3177 N94-28731
Superplasticity in fine-grained ceramics
[AD-A275461] p 3212 N94-28733
Static fracture behavior of a ceramic matrix composite at elevated temperatures
[AD-A275363] p 3177 N94-29008
Fatigue behavior of a cross-ply ceramic matrix composite under strain controlled tension-tension and tension-compression loading
[AD-A275374] p 3177 N94-29012
3-D braided, continuous fiber ceramic composites produced by chemical vapor infiltration
[AD-A275192] p 3178 N94-29024
Characterisation and processing of SiC/MAS-L glass ceramic matrix composite
[REPT-932-430-111] p 3179 N94-29412
Glass-ceramic matrix composites
[REPT-932-430-112] p 3179 N94-29413
Microfocus radioscopy, a high resolution means of inspecting composite materials
[REPT-932-430-109] p 3179 N94-29454
Method of producing a ceramic fiber-reinforced glass-ceramic matrix composite
[NASA-CASE-LEW-15264-2] p 3180 N94-29508
Analysis of pressureless densification of ceramic matrix composites p 3216 N94-29766
Interface engineering in alumina fiber/glass composites p 3182 N94-29852
Transient thermal fatigue of ceramic composites
p 3216 N94-29874
Fracture process zone of brittle composites
p 3182 N94-29876
Micromechanics of the dynamic response of ceramics and ceramic composites p 3217 N94-29975
Damage analysis and mechanical response of as-received and heat-treated Nicalon/CAS-2 glass-ceramic matrix composites p 3219 N94-30259
A review of mechanical test methods for ceramic matrix composites
[PB94-147576] p 3184 N94-30524
Effect of fiber coating on mechanical properties of Nicalon fibers and Nicalon-fiber/SiC matrix composites
[DE94-005477] p 3185 N94-30593
Microwave assisted chemical vapor infiltration
[DE94-005005] p 3185 N94-30771
A class of inclusion problems for the strengthening of brittle and ductile composites p 3186 N94-30959

CERAMICS
Adhesion of electrolessly deposited Ni(P) on alumina ceramic
[ETN-94-95358] p 3212 N94-28539
Alumina ceramic: A cost effective replacement for titanium in deep submergence pressure housings
[AD-A275640] p 3212 N94-28641
Superplasticity in fine-grained ceramics
[AD-A275461] p 3212 N94-28733
Nonaqueous slip casting of YBa2Cu3O(7-x) superconductive ceramics
[NASA-CR-4575] p 3512 N94-29101
Effect of surface condition on strength and fatigue behavior of alumina ceramic
[AD-A275053] p 3214 N94-29133
Dynamic response of ceramics
[AD-A275396] p 3214 N94-29203
Advanced microfabrication technologies for microspacecraft p 3171 N94-29782
Inorganic polymer-derived ceramic membranes
[DE94-000082] p 3216 N94-29830
Transient thermal fatigue of ceramic composites
p 3216 N94-29874
Micromechanics of the dynamic response of ceramics and ceramic composites p 3217 N94-29975
The bases for the development of high-temperature integrated SQUID-systems
[DE94-607901] p 3267 N94-30073
Synthesis and characterization of advanced materials for Navy applications p 3223 N94-30474
Normal state resistivity of MBa2Cu3O(7-x) ceramics
[DE94-608456] p 3220 N94-30745
Design of a variable-conductance vacuum insulation
[DE94-000270] p 3268 N94-30819
Material properties and fracture mechanics in relation to ceramic machining
[DE94-006623] p 3221 N94-30829

CEREBRAL CORTEX
Synaptogenesis, selective stabilization, and free association
[AD-A275250] p 3392 N94-29431

CEREBRUM
Remote control of transcranial Doppler (TCD) probe during centrifuge exposures up to 9 +Gz
[AD-A275253] p 3400 N94-29029

CERMETS
Effect of microstructure on the strength and fracture energy of bimaterial interfaces
[AD-A274987] p 3178 N94-29126

CERTIFICATION
Testing laboratories as notified bodies
[PB94-132396] p 3160 N94-28413
Ada run time system certification for avionics applications p 3150 N94-29332

CESIUM
Time and frequency technology at NIST
p 3468 N94-30641
Hydrogen masers and cesium fountains at NRC
p 3297 N94-30664

CESIUM IODIDES
Characteristics of secondary electron emission from CsI induced by x rays with energies up to 100 keV
[DE94-608422] p 3395 N94-30185

CESIUM ISOTOPES
Two-way satellite time transfer: Overview and recent developments p 3469 N94-30646

CESIUM 137
Caesium-137 in a boreal forest ecosystem: Aspects on the long-term behavior
[PB94-137809] p 3347 N94-29158

CF-700 ENGINE
Radar jet engine health monitoring project
[ASSGI-301] p 3153 N94-30130

CHANGE DETECTION
Amazonia: Remote sensing test site and survey
p 3327 N94-28935
Proceedings of the 3rd International Symposium: JERS-1 and Remote Sensing in the Future
[JTN-94-80597] p 3329 N94-29217

CHANNEL FLOW
Wall pressure events from the direct numerical simulation of a turbulent wall-bounded flow
[AD-A275890] p 3271 N94-28778
Glaciohydrologic and glaciohydraulic effects on runoff and sediment yield in glacierized basins
[AD-A275134] p 3361 N94-29286

CHANNELS
Search for the top quark in the electron-electron and electron-muon channels at D0
[DE94-006174] p 3492 N94-30779

CHANNELS (DATA TRANSMISSION)
Preliminary analysis of Asynchronous Transfer Mode (ATM) over microwave channels
[AD-A275214] p 3243 N94-29069
High throughput network for multiprocessor interconnections
[VTT-PUBS-147] p 3245 N94-29468
Extended horizon lifting for periodic gain adjustment in control systems, and for equalization of communication channels
[NASA-CASE-NPO-19166-1-CU] p 3246 N94-29495
Decoder synchronization for deep space missions
p 3250 N94-29664

CHAOS
Research activities of Martin C. Casdagli at SFI September 1989--May 1991
[DE94-005655] p 3463 N94-28548
Controlling chaos in plasma filled diodes
[AD-A275525] p 3504 N94-28686
The lectures in complex systems, volume 5
[AD-A275458] p 3466 N94-28807
Existence of quantum characteristic exponents
[PB94-138161] p 3523 N94-29146
Boundary layer coherent structures
[AD-A275007] p 3272 N94-29195
Effects of diffusion and inertia on chaotic mixing: A computational and experimental study
p 3488 N94-29903
Significant figures and Lyapunov exponents in chaos and constrained divergence of chaotic orbits
p 3467 N94-29910
A semiclassical study of quantum maps
p 3524 N94-29987
On chaos in quantum mechanics: The two meanings of sensitive dependence
[DE94-608069] p 3524 N94-30086
Superdiffusion
[DE94-002333] p 3492 N94-30834

CHAPMAN-ENSKOG THEORY
Large eddy simulations using lattice Boltzmann algorithms
[DE94-005666] p 3270 N94-28549

CHARACTER RECOGNITION
Encoding technique for automated guided vehicle POSE recovery in a structured environment
p 3144 N94-30286

CHARACTERIZATION
Synthesis and characterization of novel ternary and quaternary reduced molybdenum oxides
[DE94-005563] p 3510 N94-28529
A characterization of graphs with interval two-step graphs
[AD-A275652] p 3451 N94-28651
Seafloor characterization using texture
[AD-A275399] p 3377 N94-29204
Glass-ceramic matrix composites
[REPT-932-430-112] p 3179 N94-29413
Radioelectric characterization of materials at 1000 C
[REPT-932-430-104] p 3245 N94-29440

CHARGE CARRIERS
Carrier collection and scattering in quantum well and superlattice devices
[AD-A275443] p 3512 N94-28880
Band structure of superlattice with (delta)-like potential
[DE94-608108] p 3516 N94-30072

CHARGE COUPLED DEVICES
Response of GaAs charge storage devices to transient ionizing radiation
[DE94-005273] p 3510 N94-28484
Monolithic in-based III-V compound semiconductor focal plane array cell with single stage CCD output
[NASA-CASE-NPO-18978-1-CU] p 3265 N94-29488
Lasercom system architecture with reduced complexity
[NASA-CASE-NPO-19069-1-CU] p 3293 N94-29493
Calibration of charge coupled device digital cameras
[ISBN-0-315-85539-8] p 3290 N94-30232
Sensing the gas metal arc welding process
p 3314 N94-30444

CHARGE EXCHANGE
Wave generation by contaminant ions near a large spacecraft
[NASA-CR-195797] p 3169 N94-29917

CHARGE TRANSFER
Crystal structure of La(2-x)Ba(x)CuO4
[DE94-707688] p 3511 N94-28750
Remote pumping of solid state lasers with nuclear driven fluorescers
[DE94-004846] p 3296 N94-30614
Rotator phases in narrow-gap semiconductors
[DE94-005472] p 3521 N94-30897

CHARGED PARTICLES
Energy losses of fast charged particles in thin silicon detectors
[DE94-606065] p 3483 N94-28552
Solution of charged particle transport equation by Monte-Carlo method in the BRANDZ code system
[DE94-606270] p 3484 N94-28614
The proper field of charges and gauge-invariant variables in electrodynamics
[DE94-606405] p 3523 N94-28751
Weak decays of charged K-mesons and charm particles
[PB94-138062] p 3486 N94-29143
Some remarks about pseudo-Hamiltonian
[DE94-003273] p 3487 N94-29700
A Tevatron collider beauty factory
[DE94-004879] p 3488 N94-29930
Fast precise algorithm for simulation of ionization energy losses
[DE94-608010] p 3421 N94-30080
On relativity principle violation in local measurements of spin precession of moving particles
[DE94-608067] p 3489 N94-30085
Superdiffusion
[DE94-002333] p 3492 N94-30834
CHARM (PARTICLE PHYSICS)
Weak decays of charged K-mesons and charm particles
[PB94-138062] p 3486 N94-29143
Charmonium and bottomonium in (-p)p interactions
[DE94-006173] p 3493 N94-30886
CHARON
The Pluto fast flyby mission: Completing the reconnaissance of the solar system
p 3235 N94-29768
CHARPY IMPACT TEST
Single specimen fracture toughness determination procedure using instrumented impact test
[PB94-132040] p 3316 N94-28402
A newly developed snow vehicle (SM100S) for Antarctica. Part 3: Low temperature toughness of the welded joints of the structural steel
p 3364 N94-29983
CHARTS
A model analysis of potential vorticity on isopycnal surfaces for the global ocean
[AD-A275047] p 3377 N94-29164
CHASSIGNITES
Cosmogenic C-14 in Antarctic and non-Antarctic meteorites and lunar samples
[NASA-CR-195795] p 3546 N94-29905
CHASSIS
Acquisition, design modification, assembly, and ground test of NPS Hummingbird remotely piloted helicopter
[AD-A275546] p 3146 N94-28837
A newly developed snow vehicle (SM100S) for Antarctica. Part 3: Low temperature toughness of the welded joints of the structural steel
p 3364 N94-29983
CHEBYSHEV APPROXIMATION
Frequency-domain analysis of nonlinear microwave circuits
[PB94-132024] p 3261 N94-28400
Frequency-domain transfer-function identification using Chebyshev polynomials
[DE94-004777] p 3451 N94-28739
Process modelling for materials preparation experiments
[NASA-CR-195782] p 3175 N94-30242
Sensitivity analysis of the static aeroelastic response of a wing p 3134 N94-30525
CHECKOUT
The MACS-TSA applied in the ISO and SAX spacecraft projects
[PB94-126257] p 3170 N94-30857
CHEMICAL ANALYSIS
Measurement of elemental speciation by liquid chromatography: inductively coupled plasma mass spectrometry (LC-ICP-MS) with the Direct Injection Nebulizer (DIN)
[DE94-005261] p 3187 N94-28483
Harvard ER-2 OH laser-induced fluorescence instrument p 3343 N94-28592
Tropospheric HO2 determination by FAGE
p 3345 N94-28606
Fiscal 1991 geothermal development promotion energy
[DE94-732332] p 3337 N94-28627
Electron microscopy: Metal alloy x ray microanalysis
[REPT-932-600-101] p 3205 N94-29525
Photoelectron diffraction and holography: Some new directions
[DE94-006297] p 3289 N94-30027
Technology 2003: The Fourth National Technology Transfer Conference and Exposition, volume 1
[NASA-CP-3249] p 3555 N94-30440
A modular approach for automated sample preparation and chemical analysis p 3354 N94-30464
Fullerenes as precursors for diamond film growth without hydrogen or oxygen additions
[DE94-004582] p 3519 N94-30718
Method of test for cleanness assessment of metal alloys: The preparation of button specimens by electron beam melting and the characterisation of recovered inclusions
[NPL-DMM(A)-130] p 3210 N94-30796
CHEMICAL BONDS
Development of novel switchable protein surfaces
[AD-A275510] p 3384 N94-28667
Electronic structure and mechanical properties of grain boundaries
[AD-A275198] p 3512 N94-28890
Crosslinking and surface reactions in macromolecules: Spectroscopic FT-IR studies p 3221 N94-30812
CHEMICAL COMPOSITION
Speciation in Water and Soil: A literature review
[PB94-132388] p 3341 N94-28412
ARTI Refrigerant Database
[DE94-004906] p 3230 N94-28563
Effects of pressure on membrane-associated receptors and effector elements
[AD-A275813] p 3384 N94-28829
Method of test for cleanness assessment of metal alloys: The preparation of button specimens by electron beam melting and the characterisation of recovered inclusions
[NPL-DMM(A)-130] p 3210 N94-30796
Chemical composition of insoluble particles in superimposed ice on Storoeya, Svalbard (Sweden)
[CM-82] p 3336 N94-30944
CHEMICAL DEFENSE
Implications of climatic extremes in aircrew NBC operations p 3383 N94-28446
CHEMICAL EFFECTS
Investigations into ultraviolet matrix-assisted laser desorption
[DE94-005265] p 3296 N94-30908
CHEMICAL ENGINEERING
Qualitative vector optimization of a condensate stabilizer process
[PB94-133246] p 3189 N94-28789
CHEMICAL EXPLOSIONS
An emergency response mobile robot for operations in combustible atmospheres
[NASA-CASE-NPO-19020-1-CU] p 3299 N94-29420
XCHEM-1D: A heat transfer/chemical kinetics computer program for multilayered reactive materials
[DE94-005072] p 3226 N94-30615
CHEMICAL PROPERTIES
Gas phase thermochemistry of organogermanium compounds
[DE94-004885] p 3187 N94-28561
High temperature arc-track resistant aerospace insulation p 3167 N94-28716
A 3M high temperature dielectric film
p 3167 N94-28717
CHEMICAL REACTIONS
Low energy ion-molecule reactions and chemiionization kinetics
[DE94-005414] p 3481 N94-28491
The generalized spin-boson model for electron-transfer reactions involving two harmonic potentials with a different force constant
[DE94-005470] p 3482 N94-28509
Ozone production at a rural site in Georgia during the summer 1992 SOS campaign
[DE94-003989] p 3342 N94-28523
Peroxy radical measurements with NCAR's chemical amplifier p 3345 N94-28603
The radical amplifier p 3345 N94-28604
Tropospheric HO2 determination by FAGE
p 3345 N94-28606
Formation and chemical reactivity of carbon fibers prepared by defluorination of graphite fluoride
[NASA-TM-106398] p 3174 N94-28747
Chemical dynamics studies of reactions in energetic materials
[AD-A275607] p 3224 N94-28769
Calculation of propulsive nozzle flowfields in multidiffusing chemically reacting environments
[NASA-TM-106532] p 3271 N94-28835
The effects of molecular orientation geometry and surface anisotropy upon etching
[AD-A275154] p 3486 N94-29032
Tris(trimethylsily)arsine and lithium bis(trimethylsily)arsenide
[AD-A275075] p 3189 N94-29140
Dynamic response of ceramics
[AD-A275396] p 3214 N94-29203
The maximum entropy approach applied to energy exchange, chemical reactions and ionisation in the direct simulation Monte Carlo method for rarefied hypersonic flows
[IC-AERO-93-01] p 3524 N94-29481
Thermodynamic analysis of chemical compatibility of several compounds with Fe-Cr-Al alloys
[NASA-CR-191166] p 3181 N94-29684
Brief summary of accomplishments since our DOE-sponsored radon project commenced
[DE94-004643] p 3348 N94-29926
Reactions of metal ions and their clusters in the gas phase using laser ionization: Fourier transform mass spectrometry
[DE94-006208] p 3207 N94-30024
Application of semiclassical methods to reaction rate theory
[DE94-007041] p 3199 N94-30266
Analysis of infrared radiation heating process considering chemical reaction of material to be heated
[DE94-744116] p 3199 N94-30267
XCHEM-1D: A heat transfer/chemical kinetics computer program for multilayered reactive materials
[DE94-005072] p 3226 N94-30615
Lattice gas simulations of replicating domains
[DE94-005008] p 3200 N94-30748
Theory for electron-transfer reactions involving two Marcus surfaces with a different force constant
[DE94-005925] p 3493 N94-30874
Reinterpretation of rate data for the reaction of ClF and F2
[DE94-005819] p 3200 N94-30880
Theory for electron-transfer reactions in a three-component system: The degenerate regime
[DE94-005919] p 3493 N94-30903
CHEMICAL REACTORS
Plasma enhanced chemical vapor deposition of ZrO2 thin films
[DE94-006031] p 3218 N94-30104
Microwave assisted chemical vapor infiltration
[DE94-005005] p 3185 N94-30771
CHEMICAL VAPOR INFILTRATION
3-D braided, continuous fiber ceramic composites produced by chemical vapor infiltration
[AD-A275192] p 3178 N94-29024
Properties of chemical vapor infiltration diamond deposited in a diamond powder matrix
[DE94-005429] p 3220 N94-30591
Microwave assisted chemical vapor infiltration
[DE94-005005] p 3185 N94-30771
CHEMICAL WARFARE
Development of a new chemical warfare agent protective material p 3381 N94-28432
CHEMILUMINESCENCE
Peroxy radical measurements with NCAR's chemical amplifier p 3345 N94-28603
CHEMISORPTION
The effects of molecular orientation geometry and surface anisotropy upon etching
[AD-A275154] p 3486 N94-29032
Halogen chemisorption on silver(111): Scanning tunneling microscopy of coadsorbed halogen atoms
[AD-A275219] p 3486 N94-29060
Surface chemistry of boron-doped SiO2 CVD: Enhanced uptake of tetraethyl orthosilicate by hydroxyl groups bonded to boron
[DE94-005428] p 3221 N94-30896
CHINA
Study of dynamic characteristics of a monsoon circulation tube
[AD-A275238] p 3370 N94-29394
CHIPS (ELECTRONICS)
Construction of a connectionist network supercomputer
[AD-A275765] p 3405 N94-28764
Design and packaging of fault tolerant optoelectronic multiprocessor computing system
[AD-A275896] p 3405 N94-28798
Digitally programmable composite operational amplifier applications
[AD-A275081] p 3262 N94-28842
NSC 800, 8-bit CMOS microprocessor
[NASA-CR-195736] p 3405 N94-28845
A combined electron beam/optical lithography process step for the fabrication of sub-half-micron-gate-length MMIC chips p 3240 N94-30445
CHIRAL DYNAMICS
One-loop QCD mass effects in the production of polarized bottom and top quarks
[PB94-138104] p 3487 N94-29145
CHLORIDES
Anodization of copper in chloride media
[AD-A275565] p 3202 N94-28793
X ray crystal structures of ((Me3SiCH2)2InCl)2 and ((Me3SiCH2)InCl2)
[AD-A275074] p 3513 N94-29155
CHLORINATION
Non-aqueous cleaning solvent substitution
p 3354 N94-30466

CHLORINE
Convective flow effects on protein crystal growth
[NASA-CR-195785] p 3515 N94-30015
CHLORINE COMPOUNDS
Preparation, characterization, and facile thermolysis of (X2GaP(SiMe3)2) (X = Br, I) and (Cl3Ga2P)n; new precursors to nanocrystalline gallium phosphide
[AD-A275019] p 3513 N94-29130
Non-aqueous cleaning solvent substitution
[DE94-005339] p 3219 N94-30245
CHLORINE FLUORIDES
Reinterpretation of rate data for the reaction of ClF and F2
[DE94-005819] p 3200 N94-30880
CHLOROFLUOROCARBONS
Technology transfer initiatives
[NASA-CR-195151] p 3537 N94-29410
Materials compatibility and lubricants research on CFC-refrigerant substitutes
[DE94-004905] p 3220 N94-30692
CHLOROFLUOROMETHANE
Journal of NIRE, Vol. 2, No. 2
[JTN-94-80552] p 3187 N94-28675
Properties of adsorbents for collection and analysis of trace amount of chlorofluorocarbons in air
p 3188 N94-28680
CHLOROPRENE RESINS
Insulative properties of two thermo-metal neoprenes
[AD-A275209] p 3401 N94-29302
CHORDS (GEOMETRY)
Minimum fill-in for chordal bipartite graphs
[RUU-CS-93-11] p 3458 N94-30404
CHROMATES
Crystallization of silver chromate from ethanol via salt metathesis reactions of solubilized precursors
[AD-A275178] p 3189 N94-29058
CHROMIUM
An improved plating process p 3223 N94-30451
CHROMIUM ALLOYS
Thick thermal barrier coatings for diesel components
[NASA-CR-187111] p 3537 N94-29350
Thermodynamic analysis of chemical compatibility of several compounds with Fe-Cr-Al alloys
[NASA-CR-191166] p 3181 N94-29684
Studies on the optimization of deformation processed metal-metal matrix composites
[DE94-006033] p 3185 N94-30704
CHROMIUM CARBIDES
The organometallic chemical vapor deposition of transition metal carbides: The use of homoleptic alkyls
[DE94-005577] p 3206 N94-30007
CHROMOSPHERE
Surface differential rotation in a sample of cool dwarf stars p 3545 N94-29827
CIRCADIAN RHYTHMS
Strategies to sustain and enhance performance in stressful environments
[AD-A275223] p 3398 N94-29027
Circadian countermeasures for shiftworkers during USMP-2: A report to mission management
[NASA-CR-195260] p 3402 N94-30188
CIRCLES (GEOMETRY)
Treewidth of circle graphs
[RUU-CS-93-12] p 3458 N94-30405
CIRCUIT BOARDS
Screening of flexible cables by nonlinear resistance measurements
[AD-A275193] p 3264 N94-29289
Controlled thermal expansion printed wiring boards based on liquid crystal polymer dielectrics
[NASA-CR-189338] p 3287 N94-29400
Logistics for the implementation of lead-free solders on electronic assemblies
[DE94-004800] p 3206 N94-29936
CIRCUIT RELIABILITY
Self-stressing test structures used for high-frequency electromigration
[DE94-006142] p 3267 N94-30368
CIRCUITS
Cryogenic probe station for use in automated microwave and noise figure measurements
[NASA-TM-106560] p 3286 N94-29000
Guidance on eliminating interference from sensitive electrical circuits
[PB94-139300] p 3268 N94-30784
CIRCULAR CYLINDERS
Numerical and experimental investigation of the bending response of thin-walled composite cylinders
[NASA-CR-195730] p 3317 N94-28801
Flow past a circular cylinder with a permeable wake splitter plate p 3275 N94-29764
CIRCULAR PLATES
Further investigation of curve veering phenomena
p 3460 N94-30515
CIRCULAR TUBES
Mutual similarity of developing laminar flows with secondary streams in ducts: Curved pipe flow and orthogonal rotating pipe flow p 3129 N94-28989
CIRCULATION
Strategies to sustain and enhance performance in stressful environments
[AD-A275223] p 3398 N94-29027
CIRCULATORY SYSTEM
Effects of make-up on the heat transfer from the head in hyperthermic conditions p 3394 N94-29864
CITIES
Exploitation of stereophotogrammetrically derived 3-D wireframe models to produce urban simulations
[AD-A275459] p 3325 N94-28808
Cities for tomorrow: Directions for change
[PB94-136850] p 3537 N94-29168
A laboratory simulation of urban heat-island-induced circulation in a stratified environment
p 3367 N94-30921
CIVIL AVIATION
Effects of repair on structural integrity
[AD-A275756] p 3145 N94-28647
How to control the increase in the complexity of civil aircraft on-board systems p 3150 N94-29316
Ada run time system certification for avionics applications p 3150 N94-29332
CLADDING
A novel approach to the fabrication of SiC structures of arbitrary shape
[AD-A275475] p 3214 N94-29073
CLAMPS
System for the installation and replacement of components in hostile environments
[NASA-CASE-LEW-14906-1-SB] p 3300 N94-29427
CLASSICAL MECHANICS
A semiclassical study of quantum maps
p 3524 N94-29987
CLASSIFICATIONS
A space-based classification system for RF transients
[DE94-003933] p 3240 N94-28522
Defense Technical Information Center cataloging guidelines
[AD-A275100] p 3529 N94-28911
Copepods collected along 33.5 deg E longitude of the Antarctic Ocean in the 1976 summer
p 3358 N94-29082
Seafloor characterization using texture
[AD-A275399] p 3377 N94-29204
CLASSIFIERS
A space-based classification system for RF transients
[DE94-003933] p 3240 N94-28522
CLEAN ROOMS
The 1992 report on the next generation ultra clean technology for advanced microfabrication
[DE94-744171] p 3157 N94-30268
CLEANERS
Regenerating using aqueous cleaners with ozone and electrolysis p 3240 N94-30468
CLEANING
Surface energy changes produced by ultraviolet-ozone irradiation of poly(methylmethacrylate), polycarbone and polytetrafluoroethylene
[NASA-TM-106460] p 3213 N94-28922
Practical applications of plasma surface modification
[DE94-004892] p 3349 N94-29932
Non-aqueous cleaning solvent substitution
[DE94-005339] p 3219 N94-30245
The 1992 report on the next generation ultra clean technology for advanced microfabrication
[DE94-744171] p 3157 N94-30268
Non-aqueous cleaning solvent substitution
p 3354 N94-30466
Supersonic gas-liquid cleaning system
p 3240 N94-30467
Regenerating using aqueous cleaners with ozone and electrolysis p 3240 N94-30468
CLEANLINESS
Supersonic gas-liquid cleaning system
p 3240 N94-30467
CLEARANCES
Influence of clearance and rake angles on the cutting force of rock p 3368 N94-29520
CLIMATE
Prediction of survival times on land in a cold climate
p 3379 N94-28423
Aeromedical support for casualties in extremely hot climates p 3382 N94-28443
Work conditions assessment in pilots and ground personnel under high weather temperatures
p 3382 N94-28444
Thermal strain generated by an enhanced anti-G protection system in a hot climate p 3383 N94-28445
Implications of climatic extremes in aircrew NBC operations p 3383 N94-28446
Global atmospheric and ocean modeling on the connection machine
[DE94-003930] p 3342 N94-28521
Role of satellite observations of sea-surface temperature in the detection of global change
[PB94-138120] p 3329 N94-29107
On the annual cycle of the tropical Pacific atmosphere and ocean p 3371 N94-29763
Interannual-decadal variability in tropical climate systems: Stable isotope records and general circulation model experiments p 3373 N94-29962
Land surface interaction p 3350 N94-30621
Linkages between terrestrial ecosystems and the atmosphere p 3351 N94-30624
A toy model of sea ice growth p 3351 N94-30626
Cryosphere and climate p 3352 N94-30632
Modeling Earth system changes of the past
p 3353 N94-30635
Models of atmosphere-ecosystem-hydrology interactions: Approaches and testing
p 3353 N94-30636
Evaluating models of climate and forest vegetation
p 3353 N94-30637
CLIMATE CHANGE
Global change research: Summaries of research in FY 1993
[DE94-003150] p 3341 N94-28473
Survey on effects of petroleum substitution energy utilization on the global environment
[DE94-732339] p 3346 N94-28630
Role of satellite observations of sea-surface temperature in the detection of global change
[PB94-138120] p 3329 N94-29107
On the effect of emissions from aircraft engines on the state of the atmosphere p 3189 N94-29247
Second Japan-U.S. Workshop on Global Change: Environmental Response Technologies for Global Change (Mitigation and Adaptation) p 3354 N94-29522
GCM studies of the influence of vegetation on the general circulation: The role of albedo in modulating climate change p 3348 N94-29749
Comparison of Savannah River Site's meteorological databases
[DE94-001751] p 3373 N94-29817
Impact of biomass burning on the atmosphere
[DE94-004333] p 3349 N94-29954
Interannual-decadal variability in tropical climate systems: Stable isotope records and general circulation model experiments p 3373 N94-29962
On interannual variability and climate change in the North Pacific p 3374 N94-29963
Global patterns of cloud optical thickness variation with temperature and the implications for climate change
p 3374 N94-29972
PCCM2: A GCM adapted for scalable parallel computers
[DE94-005113] p 3350 N94-30116
Modeling the Earth System, volume 3
[NASA-CR-194256] p 3350 N94-30616
The role of sea ice dynamics in global climate change
p 3350 N94-30620
A toy model of sea ice growth p 3351 N94-30626
Cryosphere and climate p 3352 N94-30632
The challenge of identifying greenhouse gas-induced climatic change p 3352 N94-30634
Modeling Earth system changes of the past
p 3353 N94-30635
CLIMATOLOGY
Global change research: Summaries of research in FY 1993
[DE94-003150] p 3341 N94-28473
Global atmospheric and ocean modeling on the connection machine
[DE94-003930] p 3342 N94-28521
Capabilities, products, and services of USAFETAC (USAF Environmental Technical Applications Center)
[AD-A275654] p 3368 N94-28652
Studies of marine aerosols and their evolution in the eastern North Atlantic
[AD-A275011] p 3377 N94-29128
Sensitivity and feedbacks associated with vegetation-related land surface parameters in a general circulation model p 3348 N94-29800
Interannual temperature variability and cyclone frequency over Eastern Canada and the New England States. A case study: Winter seasons 1931-1932 to 1984-1985
[ISBN-0-315-74841-9] p 3373 N94-29908
On interannual variability and climate change in the North Pacific p 3374 N94-29963
PCCM2: A GCM adapted for scalable parallel computers
[DE94-005113] p 3350 N94-30116
Modeling the Earth System, volume 3
[NASA-CR-194256] p 3350 N94-30616

Towards coupled physical-biogeochemical models of the ocean carbon cycle p 3350 N94-30618
The role of sea ice dynamics in global climate change p 3350 N94-30620
Land surface interaction p 3350 N94-30621
A toy model for estimating N2O emissions from natural soils p 3351 N94-30627
Models of atmosphere-ecosystem-hydrology interactions: Approaches and testing p 3353 N94-30636
Comprehensive system models: Strategies for evaluation p 3353 N94-30638

CLIMBING FLIGHT
The effect of various metallurgical parameters on the flow and fracture behavior of polycrystalline NiAl near the brittle-to-ductile transition
[NASA-TM-106534] p 3205 N94-29758

CLINICAL MEDICINE
Clinical investigation program
[AD-A275025] p 3391 N94-29116
Evaluation of monitoring audiometry in the United States Air Force Hearing Conservation Program
[AD-A275309] p 3391 N94-29211

CLOCKS
Time and frequency technology at NIST p 3468 N94-30641
European PTTI report p 3468 N94-30642
Loran-C time management p 3144 N94-30644
Report on NATO PTTI p 3469 N94-30645
Cascaded clocks measurement and simulation findings p 3469 N94-30649
Time and position accuracy using codeless GPS p 3144 N94-30650
Remote clocks linked by a fully calibrated two-way timing link p 3471 N94-30659
Hydrogen masers and cesium fountains at NRC p 3297 N94-30664
Time maintenance system for the BMDO MSX spacecraft p 3171 N94-30672
Ground control system for the midcourse space experiment UTC clock p 3474 N94-30674
Hydrogen maser clocks in space for solid-Earth research and time-transfer applications: Experiment overview and evaluation of Russian miniature sapphire loaded cavity p 3474 N94-30676
Using GLONASS signal for clock synchronization p 3475 N94-30680
A look into the crystal ball: The next 25 years p 3475 N94-30681
The future of time and frequency dissemination p 3476 N94-30684

CLOSED ECOLOGICAL SYSTEMS
Electrochemical incineration of wastes
[NASA-CR-195262] p 3198 N94-29938
Publications of the NASA Controlled Ecological Life Support System (CELSS) program 1989-1992
[NASA-CR-4603] p 3401 N94-30122

CLOSURE LAW
An alternative assessment of second-order closure models in turbulent shear flows
[NASA-CR-194881] p 3272 N94-29381

CLOTHING
Simulation of the effect of wind on clothing by measurements and calculations
[PB94-132289] p 3399 N94-28406
Deterioration of manual performance in cold and windy climates p 3381 N94-28434

CLOUD COVER
The appearance of the Sun and Moon seen through clouds
[AD-A275338] p 3551 N94-29212
Site comparison for optical visibility statistics in southern California p 3247 N94-29617
Radiation transport in cloudy and aerosol loaded atmospheres p 3366 N94-30805

CLOUD GLACIATION
Remote sensor observations during WISP91: The use of microwave radiometers, RASS, and lidar ceilometers for detection of aircraft icing conditions
[PB94-142106] p 3136 N94-30890

CLOUD HEIGHT INDICATORS
Remote sensor observations during WISP91: The use of microwave radiometers, RASS, and lidar ceilometers for detection of aircraft icing conditions
[PB94-142106] p 3136 N94-30890

CLOUD PHYSICS
Studies of marine aerosols and their evolution in the eastern North Atlantic
[AD-A275011] p 3377 N94-29128
The incorporation and initialization of cloud water/ice in an operational forecast model p 3373 N94-29814
Correlation studies of Pioneer Venus imagery obtained from PV experiments with near IR imagery obtained from ground-based observations during Venus inferior conjunction
[NASA-CR-195772] p 3550 N94-29892
Cloud and aerosol characterization for the ARM central facility: Multiple remote sensor techniques development
[DE94-003523] p 3365 N94-30608

CLOUDS
The effects of man-made smokes and battlefield-induced smokes on the propagation of electromagnetic radiation p 3258 N94-30505

CLOUDS (METEOROLOGY)
Numerical simulations of a mountain thunderstorm. A comparison with Doppler radar observations
[AD-A275296] p 3369 N94-28873
Studies of marine aerosols and their evolution in the eastern North Atlantic
[AD-A275011] p 3377 N94-29128
Global patterns of cloud optical thickness variation with temperature and the implications for climate change p 3374 N94-29972
Cloud and aerosol characterization for the ARM central facility: Multiple remote sensor techniques development
[DE94-003523] p 3365 N94-30608

CLUTTER
Radar returns from a low-flying target over a rough sea surface under multipath and clutter conditions p 3253 N94-29882
Infrared polarization signatures p 3258 N94-30506
A hybrid electromagnetic-statistical approach for characterizing MMW scattering by terrain p 3259 N94-30510
Radar cross sections of ground clutter at 95 GHz for summer and fall conditions p 3259 N94-30512

CMOS
Digitally programmable composite operational amplifier applications
[AD-A275081] p 3262 N94-28842
NSC 800, 8-bit CMOS microprocessor
[NASA-CR-195736] p 3405 N94-28845
Nonvolatile programmable neural network synaptic array
[NASA-CASE-NPO-18578-1-CU] p 3265 N94-29426
Single event upset susceptibilities of latchup immune CMOS process programmable gate arrays p 3495 N94-30214
Multiple single event upsets in CMOS static rams p 3496 N94-30215
Determination of cosmic ray latchup rate in CMOS devices p 3497 N94-30222
Self-stressing test structures used for high-frequency electromigration
[DE94-006142] p 3267 N94-30368
A high rate, low noise, x ray silicon strip detector system
[DE94-004557] p 3268 N94-30717

CNOIDAL WAVES
Dissipation in Hamiltonian systems: Decaying cnoidal waves
[MEMO-1151] p 3460 N94-30738

COAL
Development of the integrated environmental control model: Performance models of selective catalytic reduction NO(x) control systems
[DE94-002151] p 3341 N94-28465
Proceedings of the Joint Contractors Meeting: FE/EE Advanced Turbine Systems Conference FE Fuel Cells and Coal-Fired Heat Engines Conference
[DE93-011308] p 3336 N94-28499
Journal of NIRE, Vol. 2, No. 2
[JTN-94-80552] p 3187 N94-28675
Molecular structure of coal studied by solvent extraction p 3187 N94-28676
Researches on bioconversion of coal into liquid product p 3187 N94-28677
Structural changes during carbonization and oxidation of coal p 3187 N94-28678
Methanol-mediated continuous extraction of phenolic compounds from coal liquid p 3188 N94-28679
Joint research activities with CCMRI (China) p 3240 N94-29521
Corrosion performance of materials for advanced combustion systems
[DE94-006726] p 3207 N94-30057
An electromagnetic noncontacting sensor for thickness measurement in a dispersive medium
[AIAA PAPER 94-1200-CP] p 3443 N94-30551

COAL DERIVED GASES
Biological conversion of synthesis gas
[DE94-005815] p 3340 N94-30879

COAL DERIVED LIQUIDS
Journal of NIRE, Vol. 2, No. 2
[JTN-94-80552] p 3187 N94-28675
Methanol-mediated continuous extraction of phenolic compounds from coal liquid p 3188 N94-28679

COAL LIQUEFACTION
Journal of NIRE, Vol. 2, No. 2
[JTN-94-80552] p 3187 N94-28675
Researches on bioconversion of coal into liquid product p 3187 N94-28677
Methanol-mediated continuous extraction of phenolic compounds from coal liquid p 3188 N94-28679

COASTAL CURRENTS
Objective analysis of a coastal ocean eddy using satellite AVHRR and in situ hydrographic data
[AD-A275715] p 3376 N94-28642
Statistical analysis of a satellite imagery time series: Implications for the study of coastal and estuarine circulation p 3335 N94-30919

COASTAL WATER
Bulletin of National Research Institute of Fisheries Engineering, No. 13
[JTN-94-80596] p 3233 N94-29701
Development of a simple current meter using solution p 3233 N94-29702
Statistical analysis of a satellite imagery time series: Implications for the study of coastal and estuarine circulation p 3335 N94-30919

COASTS
The undrained shear strength characteristics of undisturbed soil from fishing port areas p 3234 N94-29704

COATING
Electrodeposition of bismuth alloys by the controlled potential method
[DE94-605318] p 3212 N94-28550
Dual cure low-VOC coating process, phase 3
[DE94-003202] p 3221 N94-30826

COATINGS
Effect of fiber coating on mechanical properties of Nicalon fibers and Nicalon-fiber/SiC matrix composites
[DE94-005477] p 3185 N94-30593
Nonlinear absorption in high reflector multilayers
[DE94-005818] p 3295 N94-30598
Characterization of defect geometries in multilayer optical coatings
[DE94-005820] p 3501 N94-30599

COBALT
Study on the formation of ultrafine particles of Sm-Co intermetallic compounds using RF thermal plasma p 3211 N94-29516

COBALT ALLOYS
Performance and durability of high emittance heat receiver surfaces for solar dynamic power systems
[NASA-TM-106549] p 3172 N94-28834
Cyclic axial-torsional deformation behavior of a cobalt-base superalloy
[NASA-TM-106372] p 3203 N94-28921
Thick thermal barrier coatings for diesel components
[NASA-CR-187111] p 3537 N94-29350
Giant magnetoresistance and microstructural characteristics of epitaxial Fe-Ag and Co-Ag granular thin films
[DE94-006287] p 3519 N94-30707

COBALT COMPOUNDS
Study on the formation of ultrafine particles of Sm-Co intermetallic compounds using RF thermal plasma p 3211 N94-29516

COBALT OXIDES
Transient studies of low temperature catalysts for methane conversion
[DE94-005767] p 3200 N94-30877

COCKPITS
Thermal strain generated by an enhanced anti-G protection system in a hot climate p 3383 N94-28445
KC-135 cockpit modernization study and crew reduction feasibility demonstration
[AD-A275230] p 3146 N94-29391

CODE DIVISION MULTIPLE ACCESS
The bootstrapped algorithm: A fast algorithm for blind signal separation
[AD-A275759] p 3408 N94-28760

CODERS
Multi-speed multi-phase resolver converter
[NASA-CASE-MFS-28855-1] p 3264 N94-29372
Non-orthogonal subband/transform coder
[NASA-CASE-LEW-15310-1] p 3246 N94-29589

CODING
Video transmission on ATM networks
[NASA-CR-195124] p 3244 N94-29106
Modifications of the Griesmer bound p 3247 N94-29618
Integer cosine transform for image compression p 3247 N94-29619
Convolutional encoding of self-dual codes p 3250 N94-29662
Encoding technique for automated guided vehicle POSE recovery in a structured environment p 3144 N94-30286
Low frame rate video coding for small bandwidth realtime multimedia tele-education systems
[PB94-125531] p 3256 N94-30398
Fast and efficient variable-to-fixed-length coding algorithm
[PB94-125465] p 3424 N94-30400

Two-way satellite time transfer: Overview and recent developments p 3469 N94-30646

COGENERATION

Report of feasibility study on international-cooperation in high efficient energy conversion technology [DE94-732340] p 3337 N94-28631

COGNITION

Toward a model of expert knowledge structure and their role in cognitive task performance [AD-A275641] p 3529 N94-28645

Key cognitive issues in the design of electronic displays of instrument approach procedure charts [AD-A275647] p 3399 N94-28649

Temporal and qualitative decomposition of plausible reasoning [AD-A275073] p 3398 N94-29154

COGNITIVE PSYCHOLOGY

Key cognitive issues in the design of electronic displays of instrument approach procedure charts [AD-A275647] p 3399 N94-28649

Designing for performance: A cognitive systems engineering approach to modifying an AWACS human computer interface [AD-A275187] p 3399 N94-28861

COHERENT LIGHT

Linac Coherent Light Source (LCLS) at 2-4 nm using the SLAC linac [DE94-005235] p 3292 N94-28481

COHERENT RADAR

RL/ERCT automated swept-angle bistatic measurement system [AD-A275763] p 3241 N94-28763

COHERENT RADIATION

Enhanced coherence x ray laser experiments and simulations [DE94-005367] p 3295 N94-30060

COLD FLOW TESTS

An actively cooled floating element skin friction balance for direct measurement in high enthalpy supersonic flows p 3289 N94-29824

COLD PLASMAS

Coulomb field effect on plasma focusing and wake field acceleration [DE94-004937] p 3504 N94-28564

COLD SURFACES

On the temperature distribution near a cold surface [AD-A275162] p 3332 N94-29288

COLD TOLERANCE

Medical support for British operations in the Antarctic p 3379 N94-28421

Prediction of survival times on land in a cold climate p 3379 N94-28423

Fuelling shivering in humans during cold water immersion p 3379 N94-28426

Biochemical enhancement of cold tolerance p 3380 N94-28427

The potential of new textiles in improving survival prospects p 3380 N94-28430

Deterioration of manual performance in cold and windy climates p 3381 N94-28434

COLD WATER

Effect of seasickness on aircrew student survivor ability after ditching in cold water p 3379 N94-28425

Advanced integrated cold protection for aircrew p 3381 N94-28436

Emergency underwater breathing aids for helicopter passengers and crew p 3381 N94-28437

A comparison of four methods of rewarming individuals cooled by immersion in cold water p 3382 N94-28442

COLD WEATHER

Deterioration of manual performance in cold and windy climates p 3381 N94-28434

Effectiveness of protection clothing for cold weather conditions after ejection over sea: A case report p 3381 N94-28435

Thermoregulation in the extreme cold environment p 3381 N94-28438

Physiological investigations of the isolated rat's liver in hypothermia and hypoxia and their relevance in aircraft incidents above the sea p 3382 N94-28439

Rewarming methodologies in the field p 3382 N94-28441

COLD WEATHER TESTS

Simulation of the effect of wind on clothing by measurements and calculations [PB94-132289] p 3399 N94-28406

COLD WORKING

Cold expansion and interference for extending the fatigue life of multi-layer metal joints [AD-A274962] p 3318 N94-29091

A comparison of the evolution of cold and hot deformation microstructures and textures in fcc metals [DE94-005103] p 3210 N94-30777

COLLAGENS

Controlling the material properties of in vitro collagen through directed orientation and cross-linking of fibrils p 3221 N94-30797

COLLISION AVOIDANCE

Collision avoidance and control of multiple revolute manipulators p 3302 N94-29884

An optimal obstacle avoidance path planning algorithm for the Excalibur robot p 3306 N94-30287

COLLISIONAL PLASMAS

Conceptual study of moderately coupled plasmas and experimental comparison of laboratory x ray sources [DE94-005828] p 3506 N94-30045

COLLISIONS

Stellar and gas dynamics of interacting ring galaxies p 3548 N94-30340

COLLOIDS

Inorganic polymer-derived ceramic membranes [DE94-000082] p 3216 N94-29830

Nanosize metal alloy particle formation in Ag and Cu sequentially implanted silica [DE94-005592] p 3207 N94-30042

COLOR

Multicolor photometry of barred spiral galaxies p 3541 N94-30270

Seed viability detection using computerized false-color radiographic image enhancement p 3387 N94-30461

A commercialized, continuous flow fiber optic sensor for trichloroethylene and haloforms p 3502 N94-30462

COLOR-MAGNITUDE DIAGRAM

Globular cluster photometry near the turnoff: Blue stragglers, relative ages, and the horizontal branch p 3538 N94-29732

COMBAT

Thermal strain generated by an enhanced anti-G protection system in a hot climate p 3383 N94-28445

Simulation Networking/Training Requirements Relational Database: User's guide [AD-A275634] p 3528 N94-28637

Effects of endurance training on heat-exercise tolerance in men wearing NBC protective clothing [AD-A275176] p 3391 N94-29049

Autonomous intelligent military robots: Army ants, killer bees, and cybernetic soldiers p 3304 N94-30276

Robotics and the battlefield of the future p 3304 N94-30277

DREV activities related to military vehicles robotization p 3305 N94-30278

Autonomous Robotic Refueling System (ARRS) for rapid aircraft turnaround p 3305 N94-30279

COMBINATIONS (MATHEMATICS)

Higher order recursive program schemes are Turing incomplete [CWI-CS-R9348] p 3425 N94-30414

COMBINATORIAL ANALYSIS

A note on the complexity of local search problems [CT-93-02] p 3456 N94-30370

Perpetual reductions in orthogonal combinatory reduction systems [CWI-CS-R9349] p 3459 N94-30413

Relative length of long paths and cycles in graphs with large degree sums [MEMO-1145] p 3461 N94-30766

COMBUSTIBLE FLOW

Development of a new generation solid rocket motor ignition computer code [NASA-CR-195734] p 3171 N94-28800

Prediction of prompt NO(x) in hydrocarbon air flames p 3190 N94-29250

Flowfield prediction of NO(x) and smoke production in aircraft engines p 3191 N94-29252

Time-resolved measurements in a three dimensional model combustor p 3196 N94-29283

Scramjet CFD methods and analysis. Part 1: Scramjet CFD methods. Numerical simulation of the flow in scramjet duct p 3152 N94-29296

An investigation of the reacting vortex structures associated with pulse combustion p 3200 N94-30911

COMBUSTION

Proceedings of the Joint Contractors Meeting: FE/EE Advanced Turbine Systems Conference FE Fuel Cells and Coal-Fired Heat Engines Conference [DE93-011308] p 3336 N94-28499

Fuels combustion research [AD-A275122] p 3189 N94-29004

Numerical simulation of aerothermal characteristics in gas turbine combustors with complex geometries p 3154 N94-29255

Recent CFD applications in small gas turbine combustion systems development p 3154 N94-29257

Aerothermochemical calculations in afterburners p 3154 N94-29258

Theoretical investigation of gas-surface interactions [NASA-CR-195755] p 3272 N94-29378

An emergency response mobile robot for operations in combustible atmospheres [NASA-CASE-NPO-19020-1-CU] p 3299 N94-29420

Catalytic ignitor for regenerative propellant gun [NASA-CASE-NPO-18987-1-CU] p 3225 N94-29490

Impact of biomass burning on the atmosphere [DE94-004333] p 3349 N94-29954

The direct observation of alkali vapor species in biomass combustion and gasification [DE94-000262] p 3339 N94-30606

An investigation of the reacting vortex structures associated with pulse combustion p 3200 N94-30911

COMBUSTION CHAMBERS

Numerical study on the interaction between scramjet engine modules caused by thermal choke p 3125 N94-28960

Fuels combustion research [AD-A275122] p 3189 N94-29004

Numerical modelling of turbine combustion chambers p 3154 N94-29254

Numerical simulation of aerothermal characteristics in gas turbine combustors with complex geometries p 3154 N94-29255

Application of CFD in combustor design technology p 3154 N94-29256

Recent CFD applications in small gas turbine combustion systems development p 3154 N94-29257

Aerothermochemical calculations in afterburners p 3154 N94-29258

Fuel injector design for high temperature aircraft engine p 3154 N94-29263

The effect of incomplete fuel-air mixing on the lean limit and emissions characteristics of a Lean Prevaporized Premixed (LPP) combustor p 3193 N94-29265

Studies of lean blowout in a research combustor p 3193 N94-29266

Ultra low NO(x) ultra lean gas turbine primary zones with liquid fuels p 3154 N94-29267

Computational and experimental results in high pressure combustions of H2/air and H2/O2/H2O p 3193 N94-29268

Evaluation of the transient operation of advanced gas turbine combustors p 3154 N94-29269

Pollutant emissions from and within a model gas turbine combustor at elevated pressures and temperatures p 3194 N94-29271

Reduction of NO(x) by fuel-staging in gas turbine engines: A commitment to the future p 3194 N94-29272

Chambers of turboreactors with variable geometry: A response to the matrix of pollution in cycles at high temperature, high pressure p 3194 N94-29273

The influence of air distribution on homogeneity and pollutant formation in the primary zone of a tubular combustor p 3194 N94-29274

Effects of hydrogen addition on pollutant emissions in a gas turbine combustor p 3195 N94-29275

Spray combustion experiments and numerical predictions p 3195 N94-29277

Modeling of the phase liquidates in combustion chambers p 3195 N94-29278

Investigation of the two-phase flow in a research combustor under reacting and non-reacting conditions p 3196 N94-29282

Time-resolved measurements in a three dimensional model combustor p 3196 N94-29283

Temperature and combustion analysis of combustor with acoustically controlled primary zone air-jet mixing p 3196 N94-29284

Research and Development of Ram/Scramjets and Turboramjets in Russia [AGARD-LS-194] p 3151 N94-29291

Research and development of ramjets/ramrockets. Part 1: Integral solid propellant ramrockets p 3151 N94-29294

CIAM experimental turboramjets p 3152 N94-29299

Optical flameout detector [NASA-CASE-LAR-14997-1] p 3287 N94-29368

An actively cooled floating element skin friction balance for direct measurement in high enthalpy supersonic flows p 3289 N94-29824

Corrosion performance of materials for advanced combustion systems [DE94-006726] p 3207 N94-30057

Potential capabilities of Reynolds stress turbulence model in the COMMIX-RSM code p 3285 N94-30450

COMBUSTION CHEMISTRY

Fuels combustion research [AD-A275122] p 3189 N94-29004

Fuels and Combustion Technology for Advanced Aircraft Engines [AGARD-CP-536] p 3189 N94-29246

Prediction of prompt NO(x) in hydrocarbon air flames p 3190 N94-29250

Simulation of pollutant formation in turbulent combustors using an extended coherent flame model p 3190 N94-29251
Flowfield prediction of NO(x) and smoke production in aircraft engines p 3191 N94-29252
Numerical prediction of turbulent sooting diffusion flames p 3191 N94-29253
The effect of incomplete fuel-air mixing on the lean limit and emissions characteristics of a Lean Prevaporized Premixed (LPP) combustor p 3193 N94-29265
Computational and experimental results in high pressure combustions of H2/air and H2/O2/H2O p 3193 N94-29268
Computing at the leading edge: Research in the energy sciences
[DE94-006121] p 3563 N94-30844

COMBUSTION CONTROL
Evaluation of the transient operation of advanced gas turbine combustors p 3154 N94-29269
Fuel-rich catalytic combustion of a high density fuel
[NASA-TP-3281] p 3197 N94-29356
Activities of Ishikawajima-Harima Heavy Industries Co. Ltd.
[PB94-137981] p 3555 N94-29798

COMBUSTION PHYSICS
Measurement of volatile metal species at elevated temperatures
[PB94-132321] p 3186 N94-28407
Numerical modelling of turbine combustion chambers p 3154 N94-29254
Numerical simulation of aerothermal characteristics in gas turbine combustors with complex geometries p 3154 N94-29255
Application of CFD in combustor design technology p 3154 N94-29256
Temperature and combustion analysis of combustor with acoustically controlled primary zone air-jet mixing p 3196 N94-29284
Lifted turbulent jet flames p 3198 N94-29676
Computational fluid and combustion dynamics
[DE94-006596] p 3279 N94-30003
XCHEM-1D: A heat transfer/chemical kinetics computer program for multilayered reactive materials
[DE94-005072] p 3226 N94-30615
An investigation of the reacting vortex structures associated with pulse combustion p 3200 N94-30911

COMBUSTION PRODUCTS
Measurement of volatile metal species at elevated temperatures
[PB94-132321] p 3186 N94-28407
Development of the integrated environmental control model: Performance models of selective catalytic reduction NO(x) control systems
[DE94-002151] p 3341 N94-28465
Gas phase thermochemistry of organogermanium compounds
[DE94-004885] p 3187 N94-28561
Advanced diagnostics for reacting flows
[AD-A275057] p 3272 N94-29136
Characterization of air emissions from the simulated open combustion of fiberglass materials
[PB94-136231] p 3347 N94-29192
Fuels and Combustion Technology for Advanced Aircraft Engines
[AGARD-CP-536] p 3189 N94-29246
Simulation of pollutant formation in turbulent combustors using an extended coherent flame model p 3190 N94-29251
Flowfield prediction of NO(x) and smoke production in aircraft engines p 3191 N94-29252
Numerical prediction of turbulent sooting diffusion flames p 3191 N94-29253
The effect of incomplete fuel-air mixing on the lean limit and emissions characteristics of a Lean Prevaporized Premixed (LPP) combustor p 3193 N94-29265
Ultra low NO(x) ultra lean gas turbine primary zones with liquid fuels p 3154 N94-29267
Technology rigs: A tool for afterburner development p 3154 N94-29270
Pollutant emissions from and within a model gas turbine combustor at elevated pressures and temperatures p 3194 N94-29271
Chambers of turboreactors with variable geometry: A response to the matrix of pollution in cycles at high temperature, high pressure p 3194 N94-29273
The influence of air distribution on homogeneity and pollutant formation in the primary zone of a tubular combustor p 3194 N94-29274
Research and development of ramjets/ramrockets. Part 1: Integral solid propellant ramrockets p 3151 N94-29294
Fuel-rich catalytic combustion of a high density fuel
[NASA-TP-3281] p 3197 N94-29356
Fire behavior of aeronautical materials
[REPT-932-600-105] p 3197 N94-29457
A study of low emissions gas turbine combustions
[NASA-CR-195763] p 3152 N94-29660
Toxicity of carbon monoxide-hydrogen cyanide gas mixtures: Exposure concentration, time-to-incapacitation, carboxyhemoglobin, and blood cyanide parameters
[DOT/FAA/AM-94/7] p 3395 N94-29919
Corrosion performance of materials for advanced combustion systems
[DE94-006726] p 3207 N94-30057
The direct observation of alkali vapor species in biomass combustion and gasification
[DE94-000262] p 3339 N94-30606
Application of the extended Kalman filter to the estimation of the char mass in a fluidized bed combustor
[REPT-93-065] p 3200 N94-30938

COMBUSTION STABILITY
Combustion studies under microgravity p 3228 N94-28940
Studies of lean blowout in a research combustor p 3193 N94-29266
Chambers of turboreactors with variable geometry: A response to the matrix of pollution in cycles at high temperature, high pressure p 3194 N94-29273
The influence of air distribution on homogeneity and pollutant formation in the primary zone of a tubular combustor p 3194 N94-29274
Ducted kerosene spray flames p 3195 N94-29276
Liquid-oxygen droplet vaporization and combustion: Analysis of transcritical behavior and application to liquid-rocket combustion instability p 3197 N94-29592

COMBUSTION TEMPERATURE
Combustion for future supersonic transport propulsion p 3190 N94-29249
Temperature and combustion analysis of combustor with acoustically controlled primary zone air-jet mixing p 3196 N94-29284
Numerical simulation of radiative heat loss in an experimental burner
[DE94-002016] p 3277 N94-29923

COMET NUCLEI
Collecting cometary soil samples? Development of the ROSETTA sample acquisition system p 3160 N94-29628

COMET TAILS
Infrared observations of cometary dust by COBE p 3541 N94-29994

COMETS
Collecting cometary soil samples? Development of the ROSETTA sample acquisition system p 3160 N94-29628

COMFORT
The potential of new textiles in improving survival prospects p 3380 N94-28430
Fire-resistant water vapour permeable buoyant insulation p 3380 N94-28431
Human requirements to the indoor air quality and the thermal environment p 3232 N94-29600

COMMAND AND CONTROL
Artificial intelligence technology program at Rome Laboratory p 3414 N94-29328
ACCS Surveillance Exploratory Prototype (ASEP) p 3138 N94-29566
Multi-sensor data fusion and the use of artificial intelligence
[PB94-126216] p 3448 N94-30741

COMMERCE
Spin-off companies as agents of technology transfer: An empirical study of the spin-off companies of the Technical Research Centre of Finland
[PB94-132248] p 3537 N94-28405
Triple Diagonal modeling: A mechanism to focus productivity improvement for business success
[DE94-004309] p 3527 N94-30041

COMMERCIAL AIRCRAFT
Effects of repair on structural integrity
[AD-A275756] p 3145 N94-28647
Ada run time system certification for avionics applications p 3150 N94-29332
Installation of experimental mode-S data link in commercial aircraft
[PB94-138757] p 3254 N94-29998

COMMERCIAL SPACECRAFT
Start of space tourism p 3164 N94-29714

COMMUNICATION
On blocks: Locality and asynchronous communication (extended abstract)
[RUU-CS-92-44] p 3424 N94-30347

COMMUNICATION CABLES
NEMA wire and cable standards development programs p 3166 N94-28706
Standard testing procedures for optical fiber and unshielded twisted pair at Sandia National Laboratories
[DE94-005315] p 3501 N94-30910

COMMUNICATION EQUIPMENT
SPC toolbox: An interactive MATLAB (tm) package for signal modeling, analysis, and communications
[AD-A275617] p 3241 N94-28634
1.8 gigahertz (GHz) digital Low Density Radio Communications Link (LDRCL) Operational Test and Evaluation (OT&E) integration and OT&E operational final test report
[AD-A275800] p 3241 N94-28771
Solid-state, active-phased arrays: Some aspects of receiver design
[AD-A275893] p 3527 N94-28779
The 19th Convention on Radio Science: Abstracts of Papers
[PB94-136868] p 3244 N94-29169
Overview of microoptics: Past, present, and future p 3235 N94-29771
A combined electron beam/optical lithography process step for the fabrication of sub-half-micron-gate-length MMIC chips p 3240 N94-30445
